Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed NATHAN & DREYFUS, New York, Jan. 1st., 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the range of pulleys.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus

we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK or FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages.

FIRST.—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind.

SECOND.—Its great economy of both tallow and fuel.

THIRD.—It is self-acting, and supplies the lubricating material only while the Engine is in motion.

FOURTH.—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this cup, by its peculiar action, delivers the lubricant

in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common compression Cups.

The above Goods are Sold at Factory Rates.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a KITCHEN Tool it is indispensable. It will do any kind of perfect safety, any Stove Lid, Frying Pan, Fire Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

New Gas Light.
This Light takes the place of the Candles, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful high t. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.
The best and cheapest hay press in the United States. Presses furnished at manufacturer cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

New England Spring Bed.
The cheapest and best in the market. Rights for sale and beds at cost. Send for descriptive circular.

Logan's Rubber Back Lash Spring

Patented May 17, 1870. The attention of Manufacturers and Mill Owners is respectfully called to the above valuable invention for

Preventing Back Lash in Mill Gearing.

No argument is deemed necessary to convince an intelligent Miller of the importance of preventing back lash, as it is well known that both the quantity and quality of the flour depends largely upon the steadiness of motion of the Burrs. Whenever the motion is communicated by an engine having two points in the revolution of the Fly-Wheel where no power is applied, there must be an unequal motion, and consequently more or less back lash. By the use of every heavy fly-wheel or a high speed, this inequality of motion may be diminished, but it cannot be entirely prevented, and more steam will be required than with a lighter fly-wheel or slower speed. By the use of

Logan's Patent Rubber Springs,

the Back Lash is entirely prevented. The pinion being loose upon the spindle, and the connection between them being by the springs, the action of the springs keeps the cogs of the pinion at all times firm against those of the driving wheel, while a continuous forward pressure is given to the spindle and through it to the Mill-Stones.

The Right to the Pacific Coast is placed in our hands for sale at a very low price. Parties interested will please write for descriptive circular or call at our office and examine the model. A large number have already been sold and put into use in the Eastern States, and three are in daily use in a flour mill in this state. Parties buying territory will be furnished with the springs at manufacturing cost from the Factory in Illinois, or will be furnished with a sample to manufacture from free of charge.

WIESTER & CO.,
17 New Montgomery Street, (Grand Hotel), San Francisco.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

VOLUME XXII.
Number 10.

The Smith Patent Truss Bridge.

In bridge construction American engineers have been particularly bold and remarkably successful. The necessities of a comparatively new country where high rates prevail, have lead them to attempt, and often successfully achieve, many an undertaking which previously was considered almost impossible of execution, and have called out an immense amount of inventive talent.

Among the many inventions in the construction of wooden bridges, which have been put before the public, the Smith Truss Bridge, patented in July, 1867, seems to be rapidly coming into favor. It has been extensively used at the East, and has just been introduced on our coast. It appears to have very many excellent points, and we give an illustration and description of its main features.

Fig. 1 shows a double truss bridge with part of the joists laid and the end rafters. Each side is constructed of the upper and lower chords connected by posts extending through the chords. Each chord consists of two leaves in the single truss, three leaves in the double truss, and four leaves in the try truss. Each leaf is a plank, varying from 5x8 to 7x16 in., according to the length of the span desired. These leaves are placed two inches from each other, and packed with four-inch keys or hlocks. Only one leaf is spliced in any one panel, or between any two posts, in the same chord. The manner of joining the leaves is shown in the smaller figure to the left, below Fig. 1, where a top view of the lower chords, bottom laterals, joist, and flooring is also given.

The posts are set at an angle of about 58° with the lower chord, pointing down and toward the center of the span. They are of the same thickness throughout the span, but increase in width from the center toward each end. The post and the chord leaves are each gained about the same. In the heaviest bridges this seldom exceeds one and a half inches on each side. One bolt (or two), generally $\frac{3}{4}$ inch in diameter, passes through chord and post. The head above the upper chord, and below the lower chord, is from six to ten inches long. The braces are the same size as the posts which they support, increasing in size from the center to each end. They rest on the chord two inches above and below, but the weight is chiefly transmitted from the post above to the post below. Neither posts nor braces are gained or cut where they pass each other in the center of the truss.

The bottom lateral braces are halved at the ends, but in the center are not joined. They are held in place by a cast-iron angle block, through which a bolt passes to the

outside of the chord. The joist are laid at right angles with, and rest on, the bottom chords; the floor is laid diagonally across the joist. There is a crown or kimb of six inches to each hundred feet of span.

A cross section of the bridge is given in the smaller figure to the right, below Fig. 1, showing top tie and creel braces. These are only used at the ends of each span.

The low open truss is shown in Fig. 2. It is adapted to spans of one hundred feet and less, where a covered bridge is not desired.

The principles on which this bridge is constructed are briefly those:—That a load

of that State. One company has constructed over one hundred bridges during the present year. The Fremont Bridge over the Platte River, in Nebraska, was lot on this plan, on a tie bid with the Howe Truss. A bridge being built at Port Gibson, Miss., on this plan, has a span of two hundred and ninety feet, one of the longest, if not the longest, which we now remember as existing anywhere. We believe that several of these bridges are now being built on this coast, and that orders for others have been received; for wherever introduced and tested, as far as we know, it has given good satisfaction, and its great economy and apparent adaptability to any

THE SMITH PATENT DOUBLE TRUSS BRIDGE.

on a truss bridge strains it perpendicularly to the chords, or directly down, only when it is in the center of the span; that at all other points the strain is diagonally down-

ward, and toward the more distant support, i. e. nearly in the line of the posts; that the post so placed makes both a tie and a counterbrace.

The bridge is perfectly adjustable by placing set screws or wedges under the braces. Single spans of two hundred and fifty feet in the clear, in constant use for three years, have never shown any need of adjustment, according to a large number of testimonials. The timber being placed at an angle of about forty-five degrees, the structure is not perceptibly affected by shrinkage. The amount of material is greatly lessened by its judicious arrangement, and much dead weight of useless material, by which most bridges are ruined, thereby avoided.

This construction has been adopted by the State Board of Public Works of Ohio, for all bridges needed on the public works

who will send plans, specifications and terms to any county, township or person wishing to build, and make no charge unless the plan is used.

COPPER MINING in Cornwall, which has been steadily declining—1860, 145,359 tons of copper ore were produced, and in 1869 only 71,790 tons—is now suffering from a new form of competition, according to the statement of the London Engineer. Iron pyrites is now imported in enormous quantities from Spain and Norway, for the manufacture of sulphuric acid on Tyneside and in Lancashire. After the extraction of the sulphur from the Spanish ores, the residue is operated on for the 2 per cent. of copper which it contains; and in 1869 no less than about 4,000 tons of metal were thus obtained, the entire yield from native ore being given that year as only 8,291 tons. The importation of pyritic ore increases daily.

Hercules Powder.

An interesting test of this compound, which is manufactured by the California Powder Works, was made last Saturday. A full description of the powder was given in the SCIENTIFIC PRESS of April 23, 1870. It suffices then to state here that it is a mixture of carbon, sulphur and nitre, reduced to a fine powder and incorporated with nitro-glycerine so as to form a stiff paste, in which condition it is claimed to be safe to handle and transport. It will not explode on contact with fire, but burns quietly, and it may be hammered on hard wood without danger of explosion. It will explode, however, on being hammered on an anvil, or on being ignited in a closed vessel. In use it is exploded by means of a copper cap heavily charged with a fulminate.

The powder has been extensively used in a number of mines in this State, as at Sucker Flat, at Downieville, Smartsville, on the Fremont Grant, etc., etc., and also in other States and Territories. The present experiment was instituted at rather a short notice by Messrs. Budke and Howden, for the more special purpose of showing its power and utility in breaking up large masses of old iron. The iron cylinder of a large hydraulic press, designed to stand safely a pressure of 5 tons to the inch, was used. It was 8 feet long, 2 feet 3 inches in diameter, with a bore 3 inches in diameter. It was charged with some sand, rammed in, then a 5-lb can of powder, sand again and a second can of powder, then more sand and a third can, and finally a tamping of sand again, not very tightly packed; for the powder explodes very quickly.

The outer can was in contact with a cartridge fired by a fuse, the concussion therefrom being sufficient to explode the whole charge. When the explosion took place, the cylinder was broken up into many pieces with such violence as to throw fragments to a great distance, one piece, weighing half a ton, being tossed nearly 300 feet. The experimenters state that one-half the amount of powder would have been fully as effectual.

Messrs. Budke and Howden (the latter is chemist of the company), who instituted the experiment, propose to use the compound for breaking up old castings, as guns, etc., which are excellent material for foundries, provided they are in small enough pieces. The breaking up of such castings is very troublesome, and it is thought that by this method it can be effected easily and cheaply. The powder is manufactured of two degrees of strength,—No. 1, which is said to have the full power is of dynamite; and No. 2, which will be still more powerful and intended for use only in extreme cases. It can be obtained from the office, 314 California street, or from any of the company's agents.

THE SMITH LOW OPEN TRUSS BRIDGE.

MECHANICAL PROGRESS.

WOODEN RAILROADS.—The *Chicago Railroad Gazette* for Feb. 18th has an article by Wm. S. Huntington, in which he quotes the report of a Canadian committee appointed to examine the Clifton Wooden Railway, in Northern New York. We give an extract from this report: "The expense of keeping the track in repair will not, according to Mr. Hulburt, the engineer of the road, exceed the wages of two men to every three miles of road. These men will replace the worn out rails as fast as required. This does not include renewal of trestle or crih work. The 20-ton locomotive will easily take 80 tons per trip and make two trips daily—between Carthage and Harrisville, 47½ miles. The rails are made of maple, 14 feet long, 6 by 4 inches, laid edgewise. Mr. Hulburt suggests that rails would be best 7 by 3½ inches. The rims of the wheels are like those used on iron railways, only wider, and the flanges a little beveled, so that the flange, in pressing against the rail, does not cut it. We did not see a single rail "broomed up" or cut on the inside, and only a few on the outside, where the heart of the rail had been laid uppermost. The "switches" are made in the usual way, the rails being kept together with iron rods when required to be moved. The "keys" are made of maple plank. The rails are sunk into the ties (which are cut into 6 inches wide and 4 inches deep) and are kept in place by wedges or keys twelve inches long by four inches wide, and one and a half inches thick at one end by three-fourths of an inch at the other and driven in on the outside of the rail, keeping it against the shoulder of the ties. The ties are put down without being sided. There has not been a single car off the track since the road went into operation. The country through which the Clifton Railway is built is not only broken but even mountainous, and there is no difficulty, in our opinion, in constructing such a railway in almost any part of these townships. From the information obtained as to cost of labor, materials, etc., in the vicinity of the Clifton road, we are of the opinion that the cost of grading, furnishing ties and rails, and laying the same, with a moderate allowance of rolling stock, sufficient for some years, will not exceed for our railroads \$5,000 a mile exclusive of large bridges—and this to build in a more permanent manner than the Clifton rail is built. We are fully convinced of the practicability of wooden railways, where the principal object is a freight traffic at rates of speed from 8 to 12 miles an hour; and that next to an iron railway, or where the cost of an iron road is too great to be undertaken, wooden railways can be cheaply built, economically carried on and a large paying business done by their means."

TRAMWAY FOR CITY STREETS.—The *American Artisan* for Feb. 22nd, gives Prof. Tillman's description of his own device for this purpose:—"Employing iron as the material for the wheel-ways or tramways, I would," he says, "cast it in hollow blocks, so as to be interlocked, and its face could be provided with a series of smooth raised surfaces, alternating with impressions or indentations; and the raised surfaces could be so arranged that the wheel would be constantly sustained on a true grade by rolling over one raised surface, which should touch the middle of the tire, or rolling over two raised surfaces, which either simultaneously or alternately would give a bearing to the wheel-tire near its sides. The transverse depressions thus formed allow the toe-calk or fore part of a horseshoe to sink below the raised or grade surface, and by means of such surfaces the horse would find a sufficient bearing against which to exert the leverage of his foot. A pair of iron paths, each about one foot wide, and placed four feet and a third apart, would provide a tramway suitable for vehicles of various widths, embracing the pleasure carriage, cart, lumber-wagon and omnibus, and a pathway for a pair of horses between such tracks. The tramway could be made of hollow cast iron blocks, each about a foot long, with a projection on one end and a recess on the other, so that when brought together and interlocked, the pressure on the edge of one block would be transferred to the center of the next. Such blocks could be laid directly on pure sand, or be filled in from beneath with wood and laid on a perfectly solid and smooth foundation."

SPIRAL CUTTER FOR PLANERS.—The *Manufacturer and Builder* for March describes More's patent device for a cutter, so constructed that it may be substituted for the ordinary knife without any alteration of the planing machine. We quote:—"Instead of making the knife straight, Mr. Moore twists it around the cylindrical body and makes the edge a spiral, usually having one third of a revolution, but it can be made of any twist; the greater the twist, the less the power required. Only a small part is in the wood at a time, and the edge has a drawing motion. On account of this, the work is very much smoother than any thing that can be done with the ordinary cutter head with its direct chopping. Finished work can be turned out, such as door-panels which are ready for sand-papering. Some of the gnarled, crooked walnut worked by this machine was as smooth as the jointer of the carpenter would have left it. The shavings are all sent to one side, showing the work clean as it leaves the machine, which is an important point. It can be made right or left hand twist so as to throw the shavings upon either side. The noise is very much less than that of the ordinary cutter. In fact, it can not be heard above that of the machine unless it is in the wood. Having a shearing motion, the knives do not become dull nearly as fast as those of the ordinary straight pattern. Another point worth attention is the mode of sharpening. This is done without taking the cutter from the machine, by taking off the driving-belt and substituting another running over the feed-pulley in its place. A file or emery-plate is then placed in a suitable block and passed along the bed under the knives. This brings them down "true." A bone then takes the place of the file, and finishes the job."

CAST RAILS.—The *N. Y. Stockholder* for February 21st has an article upon the Sherman steel process so called—really the invention of Mr. Atwood, of Ohio, but named in English journals after his nephew, Mr. Sherman, who introduced it across the water. We have copied several commendatory notices of it from the journals aforesaid. Mr. Atwood makes by it cast steel axes directly from 70 per cent. ore at one melting. It now promises to have another and very extensive use. We quote:—"Last week, at Bridgeport, in Connecticut, the process was employed for casting railway bar. The result was perfectly satisfactory, and the conclusion seems to follow that the best possible steel rails may be turned out at little over the cost of the poorer English rails landed at New York. The difference between such price and that at which bars made under this process may be offered in this market, will express the profit of the manufacturer, less the inventor's royalty. But the difference to the railway companies is far larger than this, since rails may be made by this treatment wherever pig and scrap iron can be found. The expensive apparatus for rolling is dispensed with. The rails may be cast in pits, in cheap works. Every railway concern has refuse iron enough at command to justify the use of an inexpensive furnace of its own to cast rails of the Atwood steel. The poorest pig iron as well as the best are indifferently used under this process."

SAFETY CAR-TRUCK.—The *Rochester Democrat* thus describes a recent invention:—"The reader will picture in his mind an ordinary car-truck, with eight wheels. Between the forward wheels are four cone-shaped wheels of less diameter, with flanges on the outside, two of which are suspended on an independent axle from each side of the car-truck, a few inches above the level of the track. One of these wheels is on the outside of the rail and the other on the inside. The small ends of the cones face each other, but are a little over the width of the car-wheel apart. Having an independent axle, they are not in motion only when the car is off the track. On both the forward and rear trucks these wheels are hung, and their positions on each side of the car, and at each end are the same as described above. Now when a car-wheel leaves the track, either by reason of its breaking by a displaced or broken rail, an open switch, or turning a sharp curve, the car drops down on these cone-wheels, and they temporarily take the place of the main wheels, and the car rolls on the track as it did before. A shock will be felt by the dropping of the car which will give notice of the accident. The flanges of the cone-wheels will bind on the track and act as brakes to a certain extent."

SCIENTIFIC PROGRESS.

THE PHOENIXVILLE BONE CAVE.—The *U. S. Railroad Register* gives an extended notice of the bone cave recently discovered in Chester County, Pennsylvania, near Phoenixville, by Mr. Wheatly. Prof. Cope exhibited a large collection of the smaller bones at a late meeting of the American Philosophical Society. It is said to be one of the most important discoveries yet made upon the continent. The remains found consist of mammals, reptiles, insects, and plants. Among them are three species of gigantic sloth, one as large as the Megatherium of Europe. Five feet of a mastodon tusk, which when entire measured eleven feet, was found in fragments. Bones of the cave bear, two species of horse and several species of tapir, were found. The collection is also rich in the bones of the smaller animals. Further investigation will determine more definitely the age of the deposit. Prof. Cope referred, in the course of his remarks, to certain similar fossil animals of acknowledged past-pliocene age, found in cave earth on the small islands of the Antilles. W. D. Gunning writes to the *Tribune* as follows:—"The bones in this Phoenixville cave are overlaid with glacial drift. I have examined in the Philadelphia Academy a section of the cave drawn by Professor Cope. This section tells its own story. The animals whose remains are entombed in the cave lived before the epoch of the great northern drift. In those remote times America seems to have been the land of the horse, the rhinoceros, the elephant and the camel. If this horse should prove to be new, it will be the 18th species known to have lived in America before the drift period. I do not understand that any human remains or any implements fashioned by human hands have been found in the Phoenixville cave. At this stage of the investigation we cannot say that this discovery throws any light on the question of the antiquity of the human race."

NOTE ON METAPHOSPHORIC ACID.—Prof. E. N. Horsford sends the following to the editors of the *American Chemist*:—"If you precipitate common phosphate of soda with nitrate of silver, adding sufficient ammonia to keep the liquor neutral, and, having washed out the precipitate, mix it mechanically with three times its volume of purified Berkshire sand (granular silica), then dry and ignite the mixture, you will observe a reddening of the mass, indicating a change in the molecular arrangement. If now you pour over the mass diluted hydrochloric acid, less than enough to unite with all the silver, and let its action continue for some hours till all the hydrochloric acid has disappeared as chloride of silver, then, on filtering off the clear liquor, you will have an acid liquor that precipitates solution of albumen, white,—you will have one of the phases of metaphosphoric acid. This proof of the change produced in an anhydrous trimetallic phosphate by heat, to wit, the conversion of the tribasic phosphoric acid to metaphosphoric acid, may be more satisfactory than that of the decomposition of burned bones with nitrate of silver, and the exposure of the product to sunlight, which you have witnessed, and which gives to the solution in ammonia poured over paper, the characteristic red shade, while tribasic acid with similar treatment gives the black or dark brown shade."

THE GLACIERS OF THE PACIFIC SLOPE.—Clarence King describes in *Silliman's Journal* for March, his ascent of Mount Shasta in September last and discovery of several considerable glaciers. The ascent was formerly made on the south side, where there are no glaciers, "and this is why able scientific observers like Prof. Whitney and his party should have scaled the mountain without discovering their existence." The apparent absence of glaciers in a region where such abundant indications of glacial action are found, has been remarked upon. Mr. King says:—"Travel where one will, in the high Sierras or in the more elevated regions of the Rocky Mountains, he seems to be treading the pathway of a glacier of yesterday." The report of Mr. King, containing, as it will, a full description and topographical map of the mountain and the glaciers, and of the traces of the ancient glacier system, and also of Mount Hood and Mount Rainier, will be looked for with great interest.

NATURE OF THE EARTH'S INTERIOR.—David Forbes F. R. S. delivered a lecture on this subject on January 29th. *Nature* prints it in full. We give the conclusion: "If now we suppose that the earth's interior is composed of a series of concentric zones or layers made up of substances which are of more and more dense nature as they are situated nearer the center, and that the external one is rock of a density of 2.5, a calculation will show that the center or nucleus will be about 10, or as heavy as silver. If now we suppose that the zone of molten lava, which we have already concluded must exist at a depth of about 50 miles below the surface, has a density of 3, or say even 4, to give the fullest allowance for the condensing effects of superincumbent pressure, then we should find by calculation that this zone could not extend deeper than about 400 miles, since below this depth the matter would be so heavy that its density can only be explained on the supposition that it is made up of metallic compounds, and as the density of the still lower zones would continue to increase up to the very center of the earth, the inference is that the whole of this great central mass situated at a distance of some 450 miles or less below the surface, is actually formed of metals and their compounds. Whether this great central metallic nucleus is fluid or solid may next be inquired into. According to Bunsen's theory previously alluded to, it ought to be solid, for owing to the enormous pressure to which it would be exposed, the solidification of the molten sphere should first commence at the center. This view would be quite correct if the earth was composed of highly compressible non-metallic materials; but since this is not the case, and since, as before alluded to, the experimental data already obtained indicate that neither the metallic nor the less compressible substances become more refractory in proportion to the increase of pressure, we are more justified in assuming that the central nucleus also must be in a fluid condition, and the more so, not only because we know that metallic compounds are as a rule infinitely more fusible than rock silicates, but also as the well-known high temperature of the earth's interior would, by its expanding action, tend to counteract the effects of the pressure. In summing up this inquiry, the balance of evidence appears to me to be decidedly in favor of the hypothesis that the interior of our earth is a mass of molten matter arranged in concentric layers or zones according to their respective densities, and the whole enclosed within a comparatively thin external crust or shell."

PHOSPHORUS ESSENTIAL FOR FUNGOID GROWTH.—Prof. Frankland read a paper before the London Chemical Society, Feb. 2d, on the "Development of Fungi in Potable Water." He began by alluding to the experiments Dr. Heisch had made some months back with waters contaminated with sewage matter. When to such waters some sugar was added, very soon a kind of fermentation ensued, and a rich fungoid growth made its appearance. Prof. Frankland has now repeated and extended these experiments, and arrived, with one or two exceptions, at the same results. But in the course of his researches he encountered some reactions which revealed to him that the presence of sewage matter in saccharic water is in itself not sufficient to produce fungoid growth, but that the presence of phosphates in some form is indispensable to such production. * * From all his observations Prof. Frankland drew the following conclusions:—1. Potable water, mixed with sewage, urine, albumen, and certain other matters, or brought into contact with animal charcoal, subsequently develops fungoid growth, and other organisms, when small quantities of sugar are dissolved in them and they are exposed to a summer temperature. 2. The germs of these organisms are present in the atmosphere, and every water contains them after momentary contact with the air. 3. The development of these germs cannot take place without the presence of phosphoric acid, or a phosphate or phosphorus in some form of combination. Water, however much contaminated, if free from phosphorus, does not produce them.

The number of bones broken in lunatic asylums is said to have given rise in England to the more special examination of the bones of the patients, and it is stated, that the ribs of crazy folks are more brittle than those of the sane. Through the action of the diseased brain, it is suggested, there is a wasting away of the phosphates.

CORRESPONDENCE.

Notes of Travel in Tuolumne County.

[Continued from page 131.]

Quartz Mountain and Vicinity.

The App mine, on Quartz Mountain, near Jamestown, and some six miles from Sonora, is owned by Griffing & Totten. The ledge is 1,000 feet long, and from 15 to 30 feet wide. They have a 25-stamp mill crushing 15 tons per day, but with a capacity of crushing 25. Some 20 men are employed. They are now further developing the mine, the reason of not running to their full capacity. Their rock will run from \$15 to \$20 per ton. They have a shaft down 580 feet, on an incline of 60°. The hoisting works are very complete, and run by an engine of 25-horse power.

The Heslep, next adjoining the App, and parallel with it, separated only a few hundred feet by an immense horse, is owned and superintended by B. F. Heslep, Esq. This ledge is well defined, 14-feet wide, and 1,650 feet long. Mr. H. has a 15-stamp mill, run by water power, —40-foot wheel. His tunnel is in 700 feet on a water grade. At this point it is 170 feet to the surface. Nine men are regularly employed, crushing 15 tons per day (24 hours) and the rock averages \$5 per ton.

The Knox mine, one-half mile from the Heslep, and midway between this and Poverty Hill, is 1,200 feet in length, with about a 20-inch vein. It is owned by Green, Jones & Preston. They have hoisting works run by a 30-horse power engine, and a mill of ten stamps and two arastras, now crushing seven tons per day. They employ 15 men, and have lately introduced giant powder to expedite their supply of rock, as they are not running to their full capacity. They claim to get an average of \$35 per ton out of their rock, exclusive of sulphurates.

The Golden Rule, three-quarters of a mile beyond Poverty Hill, and about seven miles from Sonora, is owned by a "Joint Stock Co.," principally of San Francisco. A. S. Phifer is its superintendent, and by the way it is opened, I should say he thoroughly understands his position. Their mill of 15 stamps is run by water power, (50-foot wheel), and is now crushing 15 tons per day (24 hours) which average \$10 per ton; 16 men are employed. This mine was originally owned by a company of Italians, and was first struck in 1863. A tunnel 500 feet in length, is run in on a grade with the mill, to which the rock is brought by car. This tunnel runs nearly east; at this point, the tunnel runs south 75 feet, where their hoisting works are situated, 87 feet underground. It cost \$36 per foot to run it. The hoisting works are run by an engine of 12-horse power. At the hoisting works there is a vertical shaft 225 feet deep from the surface. The hanging wall is of serpentine, and the foot wall of feldspar formation. The vein is from 7 to 9 feet wide, and is nearly 90 percent. slate. Free gold is found in each of the above named formations, often four inches deep in the foot wall, which goes to prove the old Forty-Niners' saying, that gold was just where you find it. This company consume about 25 lbs. of giant powder weekly for blasting purposes. Their sulphurates pay them about \$40 per ton.

Tunnels now Constructing—Placer Mines.

The Kincaid Flat Company have run their tunnel through solid rock 1,130 feet. It is estimated that they have 700 feet further to go before reaching the sink of Kincaid Flat. Week before last they made 100 feet, but have not averaged more than five feet per week. This tunnel is an excellent piece of workmanship, as straight as a line. This company have the goodwill of every person in this section, from their prompt payments and honorable dealings with all whom they have had to deal.

Miller & Burch, from Monterey county, are running a similar tunnel for draining Shaw's Flat. They are progressing finely, and the accomplishment of their work will give them a fortune.

J. H. Condit Esq., of Sonora, has moved his stock of hardware, iron, groceries, etc., to a fire-proof building, lower down in the more business portion of Sonora, and is now engaged in mining out the cellar of his former store, with good results. In one week's washing, it has averaged him \$10 per day to the hand employed, running one wheelbarrow, and only as yet washing top dirt. Several pieces were found ranging from 1 to 3 ozs.; 12 wagon-loads (to test the claim before erecting

sluices) paid him \$150. In the rear of this same building, a few years since, one 25-pound chunk was found, and several of nearly that weight. A dog, digging for a gopher, at one time scratched out a piece of quartz for which Mr. C. obtained \$70. Small pieces of float quartz are now daily found in this claim containing from \$1 to \$10 dollars in free gold. L. R. Mc.

Right and Left—An Error Corrected.

EDS. PRESS.—In the SCIENTIFIC PRESS of the 18th inst., was printed a paragraph relating to the fact that the result of walking is a tendency of the right side to outwalk the left; and your conclusion is, that a person walking some distance in a forest would find himself involuntarily going to the right of his true course. Now, to a person "up a tree" in said forest, a man whose right side was outwalking his left would be seen to go more to the left, for the reason that the left foot is the pivot upon which the body must rest more than it does upon the right; otherwise, the right foot could not outwalk it. [We are obliged to correct the corrector here. The item alluded to reads as follows:—"A scientific lecturer on walking says his experiments show that one side of the body always tends to outwalk the other side." The credit of the whole paragraph belongs not to us but to the lecturer, who states that the almost invariable tendency is to wander off to the right, rather than to the left, therein differing from our correspondent. EDS. PRESS.]

A curious illustration of this tendency of the body to revolve toward the left, is the precautionary measure adopted in military training, of always advancing the left foot first, and marking time with the same in marching. It shows plainly enough that this has been ascertained to be the only mode by which a straight line can be maintained for a long march. At what period in man's history this discovery was made, I am not informed; but it is a fact bearing upon the question at issue, which I wish you to "make a note of."

One reason for the fact that, when the left foot is not trained to the contrary, the right will always gain upon it in distance, is, that the left side of the body is the weakest and the soonest fatigued. And this also is the reason why training is necessary, in order to teach the left foot to compete with the right in marching. What is called a "forced march" of an army could never be accomplished otherwise. It has been customary to attribute the ability of soldiers to make long marches, without rest, to the measured step and the exhilaration of the music. But I think the true source of such power of endurance will be found in the gradual strengthening of the motor muscles of the left side, by the training above referred to. The movement throws the duty of resting the body more upon the right foot, and thus preserves an equilibrium of muscular force, very necessary for a long period of exercise.

The same principle applies to the exercise of the body in waltzing; it being necessary to make the right foot the pivot upon which the body revolves during most of the dancing, as otherwise the fatigue would be too great; and, besides, a revolution toward the left when long continued, reverses the circulation of the blood, and promotes dizziness.

But, notwithstanding that man by training may thus apparently reverse the order of nature, it is just as philosophical to suppose that he should walk in curves as to believe that the surface of the earth upon which he walks is curved, and abounds in myriads of minor curves also. Indeed, these facts furnish another reason for the unequal movement of the body from right to left, which has been observed. The natural tendency of two persons, in passing each other, is to go to the left; and it is only by rigid training and long practice that we are enabled to "keep to the right, as the law directs." As it is, the effort sometimes results in very ludicrous "dodging," as every person knows.

There is no such thing as a mathematically straight line, or a perfectly flat surface. It would therefore be impossible to extend two lines to infinity, or to walk upon the surface for a great distance in a straightline. It is certain that two persons starting at opposite points of the compass, and even upon widely separated parallels of latitude, and walking naturally, would meet at some point on the globe, though it might re-

quire more than one circuit to accomplish that result. They would thus perform a spiral movement toward each other, each moving to the left. This does not appear very astonishing when we consider that whole nations have thus proceeded, in their migrations from east to west, and from west to east. The Anglo-Saxon race, and the races it has drawn after it, have moved to the left in their passage across the Atlantic Ocean and the North American continent; the Asiatic races have met them half-way in their transit across the Pacific, and have moved to the left also.

There are questions of vast significance opened up to the reflecting mind in connection with the simple fact with which we started in this communication, but the limits of a periodical like yours will not permit me to enlarge upon them here. One more fact, therefore, in proof of what has been stated, and I shall close.

It has been noticed that although the heart, the seat of the circulatory system, is situated in the left side of the body, the temperature of the right side is always the highest, especially after exercise. This is an evidence not only that the right side has performed the largest share of the work, but that it is endowed with the power to perform it. The size of the muscles and sinews in the right limbs, and the generally larger development of those limbs, show that they are fitted for such performance.

Exceptions are not wanting to prove the rule. There are a few left-handed people, who do all their work with the left side; but all observing people will agree that these are not so handy in the doing of it as right-handed folks. There have been found such freaks of nature as the placing of the heart in the right side, and the liver and other viscera in the left; but all who desire that their hearts should be in the "right place," will generally find it at the left side. PHILLO SOPHOS.

Shermantown, Nev., Feb. 27.

Cope District, Nevada.

[Written for the Press.]

EDS. PRESS.—I have been taking a look at the mines of this district for a few days, and I must confess that I was not a little surprised to see the large amount of ore that has been extracted from the mines during the past winter. Most of the inhabitants left here at the beginning of the cold season, but, those who did remain have gone to work and are reaping a rich reward for their labor. The El Dorado mine, situated on Buckeye Hill and owned by Messrs. Hays & Niver, is one of the finest I have had the pleasure of looking at for a long time. The ledge is full five feet wide, running in a north-westerly and south-easterly direction, dipping at an angle of about 45 degrees. The walls are well defined and covered with a whitish clay about three inches thick. The pulp assay of eleven tons of the ore, worked at Vance's mill, was \$315 per ton. The ore is of the black sulphuret character and shows largely of horn silver. They are sinking an incline and are down about 40 feet.

Sam Handee is working the Pride of the West, and is taking out some excellent ore. He has at least seventy-five tons of ore now on the dump, and is adding to this amount daily. The Argenta Co. are down 250 feet with their new shaft, and will commence to drift for their ledge at once. All things considered, the prospects for a lively time when spring opens never looked more favorable. A. M.

Mountain City, Feb. 25.

A Curious Vocation.

We extract the following from a letter received from Calaveras county, concerning a new California industry; also concerning a Calaveras county invention:

Tarantula Cultivation.—Griddles.

A curious vocation, though perfectly legitimate. S. F. Schaffle, of this (Murphy's) Camp, is actually engaged in cultivating the above named insects, for the Eastern market, and for tourists to the "Big Trees." The construction of the cells is peculiar, and no animal, fowl, or other insect has ever yet been found that builds anything to compare with it. Their cells are from three to eighteen inches deep, with a water-proof lining, coated over with a substance looking like shammy, but as fine as silk velvet, with a door, or lid which they close after them when they go in; and when they have their young, they latch it, bolt it, and then seal it perfectly water tight. They increase about 150-fold annu-

ally. Mr. S. informs me that they increase, after transplanting, some four-fold in size, in from two to five years, after which they build a new cell, to accommodate their additional corpulency.

A new idea of griddle, on which to bake hot cakes. During my travels in this section, a gentleman gave me the following particulars of a new griddle (new at least, to me). It consists of a piece of soap stone, an inch thick, surfaced on one side and cut round to fit the stove. An iron band, with two ears, surrounds its circumference, and a bail made of wire is attached for a handle. He says he is using one, and asserts that no grease is necessary to prevent the cakes sticking to the griddle, and that the taste of the hot cakes is greatly improved.

A place of resort in summer, not generally known, is the South Grove, situated six miles from the Calaveras Big Tree Grove, from which place it is reached by trail on horse-back. It is situated between the North and Middle Fork of the Stanislaus river, and contains some 1,200 trees of the same kind as at the other grove; at least 100 of them are as large as the largest ones in the Big Tree Grove. F. C. Congdon is its proprietor, and has erected a small lunch house there, to accommodate tourists. L. R. Mc.

Curious Telegraph Cable Statistics.

The Atlantic cable, although it is only about an inch in diameter, covers an area of over a million square feet of the earth's surface, that is to say, about 23 acres of ground at the bottom of the Atlantic Ocean, the area, indeed, of a small farm.

The inductive surface of the conductor of the Atlantic (1865) cable is about 481,000 square feet, or 11 acres of area. The exterior inductive surface of the gutta-percha is 1,526,845 square feet, or 35 acres.

The conductor of this cable contains 263 tons of copper, drawn into 13,250 nautical miles of No. 18 wire, a length which, laid over the surface, would more than suffice to join the north and south poles of the earth.

The insulation contains 338 tons of gutta-percha and compound.

A No. 16 copper wire, of the same resistance as a mile of the insulator of the (1865) Atlantic cable, would be over 8,000 millions of miles long, that is to say, long enough to be laid round the orbit of the planet Neptune.—Engineering.

LONDON "TIMES" IN PARIS DURING THE SIEGE.—The Times itself explains how this was managed:—"Those pages of the paper which contained communications to relatives in Paris were photographed with great care by the London Stereoscopic and Photographic Company on pieces of thin and almost transparent paper, about an inch and a half in length by an inch in width. On these impressions there could be seen by the naked eye only two legible words, 'The Times,' and six narrow brown bands representing the six columns of printed matter forming a page of the newspaper. Under the microscope, however, the brown spaces become legible, and every line of the newspaper was found to have been distinctly copied, and with the greatest clearness. The photographs were sent to Bordeaux for transmission thence by carrier pigeon to Paris. When received there, they were magnified, by the aid of the magic lantern, to a large size, and thrown upon a screen. A staff of clerks immediately transcribed the messages, and sent them off to the places indicated by the advertisers."

REPORTED SALE OF NEW MEXICAN MINES.—Asbury Harpending, one of the chief owners of the silver ledges in the vicinity of Ralston, New Mexico, has been absent from this city for about four months, endeavoring to sell the mines abroad. He failed in his efforts in New York; and afterwards went to London, where it is said he has made a conditional sale of all the chief ledges for \$1,750,000. Experts are to be sent out, who will report to their principals. Their report will show, either that the marvelous stories told about the mineral richness of the Buro-Buro district where stock sensations, gotten up with the object of attracting investment, or that they were actually based on facts. If Mr. Harpending succeeds in making the sale, it is understood that the money will be used in his pet scheme, the building up and further extension of Montgomery street South.—Bulletin.

THE LARGEST LIBRARY IN THE WORLD is the British Museum, which already contains 1,600,000 volumes, and is increasing more rapidly than any other library in the world.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, Feb. 25th: The vein in the Chicago tunnel is said to be looking better than ever; and that in the main Globe is more flattering... The Main lower tunnel of the Schenectady is being run ahead, and some good ore is found... A plan for the alterations in the M. & N. W. Mill, including Whelpley & Storer furnace and amalgamators, has been drawn by L. Lewis.

THE SNOW.—*Chronicle*, 25th: Thus far we have three times as much snow as we had all last winter. So our streams are sure to run full banks next summer.

CALAVERAS COUNTY.

QUARTZ.—*Chronicle*, March 4th: Owing to the bad weather of last week, Clark's new mill at Railroad Flat did not commence operations as was anticipated. The battery will be in readiness for crushing the coming week.

INYO COUNTY.

DEEP SPRING.—*Cor. of Independent*, Feb. 25th: We shall have the new furnace ready to fire up in 15 days. On Cottonwood creek, five miles north of Wyman is the Cyclops, located by Mr. Broder and others as early as 1863. It is a valuable mine, its metal being principally gold. Preparations are being made to extract five tons per day. Some of the ore is decomposed, and the gold can be seen in large quantities through the rock. The Leavenworth, one mile west, is two feet thick, and uniform in value. It is antimonial silver ore, with 10 per cent. of gold, and is easily reduced. Further up is the Black Hawk. This ledge is not so large, but is well defined with good walls, and contains very rich antimonial ore, assaying \$1,000 per ton. Twin Pine, owned by Davis & Millington, have ten or twelve tons of fine ore on the dump, awaiting reduction. This is a good ledge.

The Los Angeles News, of Feb. 25th says: A lot of heavy machinery, destined for the Eclipse Mine, at Independence, Inyo county, is now at the railroad depot awaiting transportation by teams to the mines.

KERN COUNTY.

WHITE RIVER.—*Courier*, Feb. 25th: A. J. Maltby is developing his mines, the Eclipse and Robert E. Lee. We learn that thirty tons of rock from the Lee, recently worked, paid at the rate of seventy-four dollars per ton. This rock can be taken out at little expense, as there are quantities in sight, and easily accessible.

LONG LOM.—Burdett & Tucker are working a very large lead with satisfactory results. The Henning & Lightner mines have been leased, and an arastra to work the rock approaches completion. The prospecting is going on briskly.

PLACER COUNTY.

THE DILLON LEDGE.—*Stars and Stripes*, March 2d: In our last we described a large and rich specimen of gold-bearing quartz from Rock Creek. Mr. Dillon, the owner of the claim, has within the past week disposed of one-half to J. Cowan and P. Hines, two experienced miners. A three foot ledge of exceedingly rich rock has been developed, and the company will proceed to active operations on an extensive scale. Rich pay has been struck on an eastern extension of the same ledge by Mr. Lowry—the "Green Emigrant"—and on a western extension P. A. Bell has had equally good luck.

The Herald of the 4th says that other parties have found good prospects on extensions of this ledge within the past few days.

Yule's gravel claims near Last Chance have been incorporated under the name of the Viola Co. Cap. stock, \$1,000,000.

NEVADA COUNTY.

THE PROSPECT.—*Transcript*, March 3d: Companies are getting water, and the melting snow will soon give a supply for the county. If during the remainder of the season the usual quantity of rain falls, the mining will extend far into the summer.

STARTED UP.—The Cement Hill Gravel Co. commenced washing on Wednesday. These claims are now opened for the first time for hydraulic mining. They were worked years ago and paid well for drifting.

We understand that work is to be renewed by Sprecker & Holbrook on the Fidelity ledge, above Washington.

ROUCH & READY.—*Cor. of same*, 4th: John Landis and James Black, owners of

the Goshen Hill claims, have just completed a sluice tunnel 1,100 feet long, after thirteen months steady work, and have an excellent three foot flume through the tunnel, 1,200 feet long. They have 5,000 feet of eleven inch hydraulic pipe with a fall of 200 feet, leading their water to a Craig's patent monitor nozzle. They will commence washing on Monday. The expense of fitting up these claims has been \$15,000.

SAN JUAN.—Bowen & Davis, on San Juan Hill, are working with a 3-inch patent nozzle, through which the water is forced at a pressure of 150 feet.

STRUCK.—*Gazette*, March 1st: Haywood, Webster & Co., have struck rich gravel on their property between Grass Valley and Rough & Ready. A specimen taken out on Monday, weighing about two pounds, contained \$150 to \$2, coarse flake gold.

WATER.—*Same of 3d*: The main ditch of the South Yuba Canal Co., Bear Valley, is running 2,400 inches of water, 1,800 inches of which goes to Dutch Flat, and 600 to Nevada in the Snow Mountain Ditch. Of this last amount, 420 inches are being used by Stranahan, Rolfe & Co., at Cement Hill.

RICH.—*Grass Valley Union*, March 1st: We were shown yesterday a lump of rich gravel from Webster & Co.'s claims on Randolph Hill. This consisted of washed pebbles and coarse grains of gold held together by cement. The weight was about three pounds. Webster & Co.'s claims are opening out rich. The new shaft, it was thought, bottomed on the regular old channel, but explorations show that the shaft struck a bar of the old stream, and that the real channel is 80 or 90 feet north. In the drift north there are six feet of gravel and in any part of this fine prospects are obtained. The average is 25 cents to the pan. The rich lump came from a place four feet above the bed rock.

BALTIC.—*Same of 4th*: The Baltic Co. have struck good gravel in their claims, two miles west of Grass Valley, on the Squirrel creek side of Randolph Hill. The bed of gravel now being piped off is four feet in thickness. The Co. will have water until late in the summer, and probably the whole season.

Same of 5th says a prospect of this gravel in the Baltic gave \$3.50 for two pans of dirt. The Co. is sure of a good thing.

GREENHORN MINE.—Reports are encouraging. The mill is working constantly with good results. The rock pays \$28 per ton, with a ledge of 5 to 7 feet in thickness.

BLUE CEMENT ON ALTA HILL.—*Same of 7th* says: Yesterday the miners sinking the shaft for Alta Co. No. 3, came across a singular deposit. At a depth of 150 feet the pipe clay gave place to a blue cement, such as is found at Smartsville and Sucker Flat, and this shows well in free gold. Several prospects gave, as an average, twenty-five cents worth of gold to the pan of cement. This cement is three feet in thickness.

PLUMAS COUNTY.

ITEMS.—*Quincy National*, Feb. 18th: Johnny Radley is getting good prospects in the gravel range near Butterfly Valley. He thinks he has struck an extension of the channel in Black Hawk creek... At Argentine, Concklin & Ray have shut down their mill until they can put in a new boiler... Billy Yeates, who has recently made a trip to Eureka Mills, informs us that the rock now taken is very rich, the ore being visible in a large portion of it... Bachelder's mine, near Round Valley shows more rich rock than ever before, and the mill is paying largely. The quartz interest in the neighborhood of Indian Valley is improving steadily.

ITEMS.—*Same of 25th*: We hear it reported that very rich rock has been found in the Kittle ledge, (Jenkins & Kellogg's) at Cherokee... Rumor says that \$60,000 was offered for a quartz claim near Indian Valley, one day last week, and refused... The warm weather of last week started the pipes in several hydraulic claims, but the heavy fall of snow has checked the water... The wind on Tuesday night threw down the high flume belonging to E. H. Metcalf of Gopher Hill. He will have it in running order by the time the water commences to run.

SAN DIEGO COUNTY.

FROM THE MINES.—*Union*, Feb. 23d: We continue to receive good news from the Julian and Banner districts. The mines in the San Felipe Cañon are turning out handsomely. McMechan's Mill is running steadily. A large shipment of bullion left that mill yesterday for Pauly & Sons of this city. This firm forwarded \$1,600 worth of bullion, from the Helvetia mine to San Francisco by the last steamer.

A telegram dated March 2d, says: At Julian City the late storm raged for three

days. The roads are almost entirely destroyed, and in consequence of the impossibility of getting quartz to the mill, mining operations will be suspended until the roads can be repaired.

SIERRA COUNTY.

ITEMS.—*Messenger*, March 4th: We hear that a company in Humburg have struck it rich in gold... At Grizzly, there is eight feet of snow; enough for the season's mining... It is rumored that the Ned Leonard Quartz ledge and Mill has been sold.

HOWLAND FLAT.—*Cor. of same*: Three feet of snow fell during the week, making eight feet now on the ground, which with the usual March storm, will insure a fair season.

SISKIYOU COUNTY.

ITEMS.—*Yreka Union*, March 1st: The quartz mill recently erected on Jackass Gulch, Salmou River, is not doing as well as was anticipated... Lawton & Skinner of the Siskiyou Iron Works are making the castings for a quartz mill to be erected on Greenhorn by Abbott, Sullivan & Co... There is no water for hydraulicing at Oro Fino yet. There will be an abundance, however, as soon as the weather becomes warm enough to melt the snow in the mountains... No water in the Big Ditch yet. It is all absorbed before it gets half way down... The storms of last week will do the miners good, but they were not severe enough to secure a good mining season.

TRINITY COUNTY.

CLEAR CREEK.—*Cor. of Journal*, March 4th: Parties report the good prospects as still holding out and plenty of ground for others. It is hard getting in there now on account of the snow. A German started three weeks since to go over there, but getting lost was obliged to lie out in the rain; the next day he stumbled upon a quartz ledge on the head of Hay Gulch and came back to town for provisions, intending to return and prospect it. The specimens that he showed contained gold visible to the naked eye... Peter Lund came in the other day with near \$80 in coarse gold that he had taken out with a pan alone from some diggings on one of the tributaries of the East Fork.

TUOLUMNE COUNTY.

CONDIT CLAIM.—Mining is going on at Condit's old store. Every day pieces of quartz are found that are very rich in gold. The store was built on ground that had not been mined; it is proving so rich now that we fear a mining hole will soon take the place of the building. Pieces containing from one to three hundred dollars each have been taken out within a week. So says the Sonora Democrat.

Nevada.

COPE DISTRICT.

The Elko Independent of March 4th says: More activity is apparent than for months. Argenta is yielding fine pay ore, and the company pay their debts promptly. A new ledge called the El Dorado, owned by Wilson, Hay and others, is yielding magnificent ore, and employs a large number of men. The California mine is worked by Duncan and others successfully. The Idaho ledge is being worked continuously. The Norton mill, always at work, gives great satisfaction. New machinery is on the way to Vance's mill.

ELY DISTRICT.

BULLION.—*Record*, Feb. 26th: The shipments for the week ending February 21st, amount to \$34,963.66; also 15 bars of base bullion amounting to \$2,000.

Same of March 2d. A silver bar is on exhibition at Pony saloon, extracted from 4 tons of ore, valued at \$17.06 gold, and \$565.18 silver. This ore is from the newly discovered district near Highland. The claim is owned by Billy Mitchell, Pearman and others.

EUREKA DISTRICT.

ROSLIN.—*Sentinel*, March 4th: This furnace has been turning out an amount of bullion that has astonished even the owners. For some time past the principal ore worked has been the Bullwhacker. The ore in this mine can be literally quarried out, and, in addition to the contract to furnish 4,000 tons to the Roslin West, and a large quantity to the Roslin furnace, Murphy & Foreman are making arrangements to build a furnace.

BUTTERCUP.—The furnaces were started up several days ago, and have turned out large quantities of bullion of high grade. A new chamber has been struck in the Jackson mine of very rich ore, and much larger than any before.

Ogden, Dume & Co. have consolidated with Messrs. Adams, McCoy and others, under the name of Richmond Mining Co., with a capital of \$250,000. They will begin to turn out bullion in two weeks.

ITEMS.—The Jones mine has 30 or 40 tons ore on dump that will mill \$200... The Hodgdon mine improves... So does the Adams & Farren... A 20-stamp mill will be running July 1st on the Geddes & Bertraud mines... The Home Ticket never looked so well... The Stockton has a large amount of ore exposed... The X Y Z has become the property of the South Eureka Co. and is getting out fine ore in large quantity. It has been incorporated at \$2,500,000 and the superintendent informs us that by selling the ores the stockholders can realize two per cent., per month on the capital; while it is the intention to put up furnaces as soon as spring opens.

ESMERALDA.

A telegram of March 14th says: Parties from the south give good reports of mining prospects in Pine Grove and other districts in Esmeralda county.

HUMBOLDT.

RYE PATCH.—*Cor. Register*, March 4th: Rocky mine shaft is down 40 feet, and shows a two-foot ledge of fine ore... The Butte mine has an incline down 150 feet, and a drift in 225 feet... The Alpha will start up in a few weeks... Akin furnace turns out bullion 994 fine.

GOLD RUN.—L. D. Webb, owner of the Second South Extension of the old Golconda mine, says that his ledge shows a splendid body of rock, from which an assay was made a few days ago, amounting to \$971 per ton. He has on the dump 300 tons. He also states that Lovejoy is developing the First South, and Cusie the First North extensions of the old Golconda, and both mines look well.

BULLION.—*Silver State*, March 4th: The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last, was \$653 pounds, valued at \$6,726.08.

ECLIPSE MINE.—The company hope to reach the ledge early in April, intending to put on another shift, in order to run day and night. While running the incline, ore was taken out that worked at the Auburn Mill, in Reno, as high as \$1,300 per ton. The ledge averages in width about 4 feet. The mine is owned by four persons—all residents of Unionville.

REESE RIVER.

BULLION.—*Reneille*, March 2d: Amount shipped by the Manhattan Co., of this city, through Wells, Fargo & Co., during the month of February, was 88 bars of the value of \$88,781.42; total amount shipped from this city during February, 118 bars of bullion, weighing 10,026 pounds, and of the aggregate value of \$101,801.61. Thirty-four of the bars were the product of Caulfields mill, at Belmont, ten from Montezuma, and the balance Manhattan mill.

WASHOE.

CHOLLAR-POTOSI.—*Enterprise*, March 5: This mine is looking exceedingly well in every part. The amount of ore extracted during the week was 1,700 tons, of which 1,422 tons were forwarded to the mills. The average assay value has been \$65.22 per ton, making the yield for the week \$97,436. One bar shipped yesterday weighed 1,600 ounces and was worth \$9,091.81 or \$5.60 per ounce.

DANEX.—The drift from the main shaft is in 99½ feet. The rock is hard and the drift very wet, the amount of water lifted by the pumps being about 300 gallons per minute. The drift is rapidly draining the old mine.

SUTRO TUNNEL.—The tunnel is in 1,844 feet. It is very wet, as they struck a stream of 20 inches of water during the past week. The rock is hard but full of seams.

OPHIR.—Work is progressing favorably in the "uprise" from the south drift, but ore has not yet been found. Hoisting timbers by hand up the rise makes it slow work, but the up-rise is being pushed as rapidly as possible.

VIRGINIA CONSOLIDATED.—The branch drift to the northwest from the main west drift is being pushed ahead as fast as possible. The ground in which it is being run is still a mixture of quartz and porphyry. A great deal of water is coming in. It is necessary to timber all the time.

CALEDONIA.—The Co. are taking out 50 tons per day. The Sapphire mill started up night before last on ore from this mine. This week the Piute mill will also start up. The quantity of ore extracted will soon be nearly doubled.

BUCKEYE.—Louis Janin has been appointed Supt. in place of H. K. Boyd, resigned. The work done has heretofore been merely of a prospecting nature. During the present month hoisting works will be erected, pumps put in and the mine opened in a scientific manner, when they will be able to extract 30 to 40 tons of ore per day. The ores are now worked at the Franklin mill and at custom mills.

SIERRA NEVADA.—Mine and mills run-

ning as usual. The ore in the Sacramento and Meredith portion of the mine has much improved.

SAVAOE.—This mine is yielding as usual and the ore breasts are looking well. A good deal of prospecting is going on.

HALE AND NORCROSS.—The usual shipments of ore are made, and the ore breasts are looking well.

IMPERIAL.—The sinking of the main shaft is continued and good progress is made.

YELLOW JACKET.—The Yellow Jacket has declared a dividend of \$2 per share and carries over a large surplus. The mine is looking well.

CROWN POINT.—There has been great improvement in the new ore body on the 1,100-foot level this week, and the mine is now the center of attraction on the Comstock.

WHITE PINE.

REVIEW.—*News*, March 4th: A heavier force of workmen has been placed in the Original Hidden Treasure, which has been for a few weeks in a dormant state. The other mines on the Hill have been worked throughout the week with uniformly good results. As regards our base metal interests, they do not look as favorable. But very few claims are now being worked. Our smelting works are idle. The new Rothschild works, which it was expected would have been in operation some time before this, still remain idle. The furnace connected with the Big Smoky mill has all it can do.

WEEKLY SHIPMENT.—Wells, Fargo & Co. shipped, during the last week, from this city, 15 bars bullion, valued at \$19,471.43—produced by mills in this district.

MILLS AND FURNACES.—Big Smoky mill has been working over from Pioche and from the Page & Corwin mine at Secret Cofion, together with ores from the Posthole and other mines on Treasure Hill. The Page & Corwin ore worked about \$500 per ton, and we understand the ore was worked within 9 per cent. of the sample assay. Metropolitan running as usual with a good supply of ore on hand. Swansea will be ready to run as a dry crusher, probably in the early part of the week. Stanford has not yet completed repairs. Oasis, we understand, has shut down, but the report needs confirmation. Jackson furnace, shut down the early part of the week for necessary repairs.

PATENTS GRANTED.—United States patents have been granted to the Aurora Consolidated Co. upon the Aurora and Iceberg lodes; also to the Eberhardt Mill and Mining Co. on the Eberhardt lode.

ITEMS.—Work in North Aurora resumed with small force to keep the mill running. Silver Wave produces 10 tons ore daily. Mammoth has a large body high grade ore in sight, assays \$120 to the ton. Eclipse Consolidated is now going through good ore. An old dump on the Virginia has been removed and disclosed very rich croppings.

Arizona.

BRADSHAW.—Prescott *Miner*, Feb. 18th: The excitement is still intense. Mr. Riggs, an old Nevada miner, and for years underground foreman of the Savage mine, says the ore of the Tiger lode is far richer than any ever taken out of the Comstock.

MORE.—Same of 25th says: The facts are that the Tiger lode crops out of the ground, and is located in claims of 200 feet each, for over three miles; that the width of the ledge is from four to thirty feet; that the ore assays from \$800 to \$6,000 per ton in silver; that native silver is to be seen all through the rock; that, before a hole five feet in depth had been sunk into it, as high as \$25 per foot was offered and refused for it. Its sister ledges—the Tigress, Lion, Hunter, Del Pasco, Espinosa, etc., are nearly, if not quite, as rich. Assayers agree with Mr. Riggs in his opinion of the Tiger's richness.

BIG BUG.—Mr. Gray, of the Big Bug Co., came to town last week "laughing all over," having just made the largest clean-up of gold dust ever made at his mill.

WALKER.—Messrs. Shelton, Pointer, and other miners are taking out ore, and arranging it. Shelton has gold ore that will go \$1,000 to the ton, and says he would not sell his ledge—the Vernon—for \$100,000. Mr. Pointer is just about as independent.

HASSAYAMPA.—The "Davis" lode is, at present, the sensation. It is a large, well-defined vein, and pays \$100 per ton in gold.

PLACER MINING.—Anderson & Pardee took out of their claim on the Hassayampa, week before last, \$145. At Bradshaw, two men, with a rocker, took out \$65 in one day.

The laws of Pine Grove District (includ-

ing the Bradshaw mountains) provide that no work is required to hold claims, "until the cessation of Indian hostilities."

Colorado.

THIRTY THOUSAND DOLLARS TO THE TON.—*Register*, March 1st: In the Caribon mine, in the lower level on the south crevice, 111 feet west of the main shaft, a remarkably rich pocket of ore has been opened. It consists of probably the purest silver glance ever mined in this country, and assays enormously. An average specimen assayed \$28,056.70 per ton, while the purest assays \$32,764.20, in coin. Such a rich body of ore can only exist in a pocket, but at present it shows nearly eighteen inches in width. Its length and depth are not yet ascertained.

ITEMS.—A single cord of Seuderbug ore, run in Kimber's stamp mill, yielded 28 ozs. and 13 dwts., of which the currency value is \$525. The Gunnell Co.'s property has been leased, and operations will be commenced in a few days.

THE GOLD SHIPMENT.—The amount of gold sent East by the three banks of Central for this week will reach \$24,000—a remarkable product for the third week of the month, which is always a dull one for the gold trade.

Idaho.

ITEMS.—*Avantache*, Feb. 25th: Wells, Fargo & Co. shipped this week 14 bars of bullion, valued at \$38,720.76. Ben. Cook & Co. are at work on the third extension south of the Oro Fino.

THE COMING SEASON.—*Statesman*, Feb. 25th: From all quarters the indications are cheering. In Boise county the drawback, want of water, still exists. But measures have been taken to make every drop available, so that the yield will not fall off from last year. The camps to the north begin to look up, ditches have been dug and preparations made. Hydranlics will be running in Deadwood, Stanley, on Salmon river, and in Lemhi county. In the Lemhi Basin, it is now known that there are thousands of acres which will pay by the hydranlic process. Within the past season, there has been an important discovery made hard by to Leesburg in Moose creek. The depth of the ground makes the opening of claims a matter of time and labor. But in the three or four places where they are open, they are found to be ounce diggings. As to quartz, we have no hesitation in asserting that the yield will be a large increase. Quartz development has received a new impetus in Owyhee, in Boise, in Alturas, and in almost every county in the territory. In addition, our advices are that there is a greater abundance of snow in the mountains than for several seasons before.

SNAKE RIVER.—It is reported that good diggings have been discovered higher up the river than those heretofore worked. In these latter, Capt. Bledsoe is at work with derricks, clearing away the large rocks. He thus avoids the necessity of blasting. The gold is mostly found under these rocks. So Mr. T. Newell writes the *Democrat*.

ROCKY BAR.—The *Democrat* of Feb. 25th gives an extract from a private letter: Snow on the level is four feet in depth, while between here and Atlanta it is eight to twelve feet. All placer miners are making preparations to go to work early and quartz men are taking out the best of rock. Everything indicates that there will be more money taken out of quartz through the arastras than at any time since the summer of 1864.

New Mexico.

The San Diego *Union* of Feb. 23d, has a Ralston letter from which we clip: "News has been received, that an English company has purchased property to the amount of \$1,000,000, and that very soon work will commence on a large scale on nearly all the main ledges. Already shafts are being sunk on two of the New Mexican Mining Co.'s claims—the Jackson and Potosi—and, at a depth of twenty feet the quartz is found much improved in appearance. Many new ledges have been discovered this winter, some of which are ten feet wide."

Utah.

The Colorado *Register* for March 1st says: "The reported sale of the Emma mine, in Utah, has fallen through, owing to the fact that James E. Lyon has set up an adverse title. He claims that he owned the mine and struck pay there years ago; and that the parties who recently negotiated the reported sale were the ones whom he had employed to work on it."

An Ogden telegram of March 2d says there is excitement over the discovery of rich surface gold diggings one mile from the Ogden depot. The claims are being rapidly taken up.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., March 9.

After the unusual activity during the week previous, the mining share market experienced a reaction last Friday, with a quite general fall in the prices of most descriptions. This was followed by more activity and an upward tendency, but this lasted only momentarily, the market being weaker thereafter. Amador has been quoted twice at \$340 and \$335. Mammoth reached its highest point of \$1 on the 4th inst. Meadow Valley has suffered a very considerable decline.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

CALF AND KIP SKINS.—The close of the war has made no difference in the price of French stock as yet, and probably will not. Domestic skins rule the same as heretofore.

Best French Calf Skins, \$100.....	75 00 @ 100 57
Common French Calf Skins, \$100.....	35 00 @ 75 00
French Kips, \$100.....	2 15 @ 1 00
California Kip, \$100.....	60 00 @ 75 00
California Calf, \$100.....	1 00 @ 1 00
Eastern Wheel Stuffed Calf, \$100.....	800 @ 1 25
Eastern Calf for Backs, per lb.....	1 10 @ 1 5

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING FEBRUARY 21st.

MANDREL FOR GAUGING AND CUTTING SOLDER WIRE.—Lewis Cutting, San Francisco, Cal., assignor to himself and Francis Cutting.

PRIVY.—Frank Riedel, San Francisco, Cal.

MOP-HOLDER.—John Brizee, Alvarado, Cal.

SEWING MACHINE FEEDING MECHANISM.—Mary P. Carpenter, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

IMPROVED TRUSS.—A Folleau, S. F.—This form of truss seems to be one calculated to effect good service, allowing of greater or less pressure according to need, and not permitting the parts to protrude through any sudden movement of the person. It consists in the use of a secondary pad within the ordinary pad, so constructed that it may be made to give additional pressure towards the center; and in so constructing the spring in parts, that it will readily yield to the motion of the body in different directions, without for a moment losing its efficiency in keeping the pad in place. The pad is so connected with the spring that its angle or position with reference to the spring can be readily adapted to the different forms of rupture.

OPERATING CUTTERS FOR STEAM PLOWS. O. Hyde, Oakland, Cal.—These improvements in mounting and operating the cutters of steam plows, refer more particularly to that class of plows in which a number of circular cutters are driven by the same power which propels the machine. The invention consists of a frame of peculiar construction in which are arranged as many sliding blocks as there are cutters. This frame is hinged to the rear end of the machine in such a manner that it can move freely, and it is supported at its rear on rollers or elastic shoes. The cutter shafts pass through the sliding blocks so that the cutters may be operated independently of one another in such a way as to accommodate themselves to the irregularities of the ground.

ELASTIC TIRE FOR TRACTION ENGINES.—O. Hyde, Oakland, Cal.—The ordinary rubber tire used in such machines is very expensive on account of the difficulty experienced in molding and vulcanizing so large a mass of rubber. In order to reduce materially this item of expense, Mr. Hyde proposes to make the tire in sections, and to fasten these sections upon the wheel so as to form a continuous rubber tire. For this purpose he has the metallic tire of the driving wheels cast with T-shaped projections at regular intervals around its entire circumference, these forming ridges which pass entirely across the face of the tire. Blocks or slabs of rubber of any convenient size are used, having a recess, passing across each lower corner from side to side, of a proper form to fit one half of the T-shaped projections, the blocks being slid into place from one end of the tire to the other. The blocks have also passing through them, holes countersunk upon the outer face to accommodate large flat-headed bolts which pass through the metallic tire. The lower ends of these bolts are forked and spread apart so as to form a key which prevents the bolt from coming out, while allowing it to move sufficiently as the rubber blocks are compressed and expanded. In this way a cheap elastic tire may be made, and can be repaired easily when damaged in any portion, without the necessity of throwing away the whole tire, while other advantages over the common tire are obtained.

Drawing a Circle.

There are many simple little ways of doing things without the need of extensive apparatus, which is often useful to know. We cannot always be sure of having the mechanical appliances on hand when we need them, and we may therefore be put to considerable trouble to effect some simple object, when, if we knew it, we could easily do what we wanted by properly using our hands.

The accompanying illustration shows an easy method of drawing a circle without compasses, and one which allows of considerable accuracy. The cut hardly needs a description. The pencil, with point resting on the paper, is held between the thumb and forefinger in the manner indicated. The thumb presses on the paper which is then revolved, with the left hand, in the direction denoted by the arrow. In the beginning a little difficulty may be experienced in getting the pencil to mark an unbroken circle, but with a little practice, this difficulty will disappear and a curve

accurate enough for many purposes can easily be made. Indeed, we are told that, with experience, as perfect a circle can be thus drawn as is done with the aid of compasses.

Why Circles Please the Eye.

Prof. Muller, in a course of lectures in Berlin, offered a simple and mechanical explanation of the universal admiration bestowed on these curves. The eye is moved in its socket by six muscles, of which four are respectively employed to raise, depress, turn to the right and to the left. The other two have an action contrary to one another, and roll the eye on its axis, or from the outside downward, and inside upward. On an object being presented for inspection, the first act is that of circumvision, or going round the boundary lines, so as to bring consecutively every individual portion of the circumference upon the most delicate and, sensitive portion of the retina. Now, if figures bounded by straight lines be presented for inspection, it is obvious that but two of these muscles can be called into action, and it is equally evident that in curves of a circle or ellipse all must alternately be brought into action. The effect then is, that if two only be employed, as in rectilinear figures, those two have an undue share of labor; and by repeating the experiment frequently, as we do in childhood, the notion of tedium is instilled, and we form gradually, a distaste for straight lines, and are led to prefer those curves which supply a more general and equable share to work the muscles.

SAVING RATHER THAN EARNING BRINS WEAITH.—In evidence of this proposition the New Orleans *Picayune* tells the story of a printer who, when his fellow-workmen went out to drink beer, during the working-hours, put in the bank the exact amount which he would have spent if he gone out to drink. He kept to this resolution for five years. He then examined his bank account and found he had on deposit \$521 86. In the five years he had not lost a day from ill-health. Three out of five of his fellow-workmen had, in the meantime, become drunkards, were worthless as workmen, and were discharged. The water-drinker then bought out the printing office, went on enlarging the business, and in twenty years from the time he began to put by his money was worth \$100,000. The story, whether new or old, teaches a lesson which every young mechanic should lay to heart.

Greasing Wagons.

Greasing buggies and wagons is of more importance than some people imagine. Many a wheel is ruined by oiling too plentifully. A well made wheel will endure constant wear for ten to twenty years if care is taken to use the right kind and proper amount of oil; but if this matter is not attended to, the wheel will be used up in five or six years, or may be sooner. Lard should never be used on a wagon; for it will penetrate the hub and work its way out around the tenons of the spokes and spoil the wheel. Castor oil is a good material for use on an iron axle; just oil enough should be applied to a spindle to give it a light coating; this is better than more, for the surplus put on will work out at the ends and be forced by the shoulders and nut into the hub around outside of the boxes. To oil an axletree, first wipe the spindle clean with a cloth wet with turpentine, if it won't wipe without it. On a buggy or carriage, wipe and clean off the back and front ends of the hubs and then apply a very small quantity of castor oil, or some especially prepared lubricator near the shoulders and point.

ANACONDA SKIN LEATHER.—Last summer, so it is said, a Boston establishment

tanned fifty anaconda skins for boot leather. The boots are valued at \$50 a pair. The largest of these skins was forty feet in length. The tanning processes were similar to those observed in the manufacture of alligator leather, the product being a very beautiful and highly finished quality of leather, glossy, mottled, pliable, and from the appearance of grain exceedingly durable.

TOMATO FIGS—HOW TO PREPARE THEM.—Tomatoes cured nearly in the same manner as figs are said to make as good fruit, and scarcely distinguishable from the regular Smyrna fig. The experiment does not cost much, and is certainly worth trying. The tomatoes are taken ripe, scalded, and the skin taken off to allow them to absorb the saccharine principle, and then covered over with fine sugar and laid out to dry. When nearly dry, they are taken and placed in alternate layers with sugar, and when thus cured are said to be as good as any fig.

COAL NEAR MONTEREY.—The San Juan *Echo* says Dr. Matthews, of Monterey county, has discovered a valuable deposit of coal 30 miles southeast of the town of San Juan, in the Coast Range. Samples, it is said, have been tried by a blacksmith, and pronounced of superior quality for use in the forge.

GREATEST AVERAGE YIELD.—Kansas leads all the States in the average yield of corn, it being 42.2, and California 41.4. She also stands third in yield of wheat, barley, potatoes and hay, and seventh in buckwheat.

WILD PIGEONS.—Since the late severe storms wild pigeons have become very numerous in the lower part of El Dorado county. One day last week a flock of several thousand took refuge in the timber near Latrobe, and sportsmen there had a grand time.

OUT OF DATE.—It is said that there is now but one station in all Greenland, in the vicinity of which there are any heathens to be found. In fact nearly all the inhabitants of that country now profess Christianity. We shall soon have to get a new version of the favorite missionary hymn "From Greenland's Icy Mountains."

THE SACRAMENTO BEET SUGAR COMPANY has contracted for the plowing and planting of 450 acres with sugar-beets. Every acre is to be plowed 15 inches deep—no shallow tillage there. The ground is being planted at the rate of ten acres per day.

CARBONATE OF SODA IN WASHING.—The carbonate of soda, so popular with the washerwoman, is quite injurious to the fiber of linen. A French writer says that a much better way is to soak the clothes in a solution of 2 pounds of soap to 25 quarts of warm water, to which are added one tablespoonful of essence of turpentine and 3 spoonfuls of ammonia. The articles should be soaked several hours and the tub covered. The articles are then to be washed in the ordinary way. The ammonia exerts no corrosive action on the fiber, and the odor of turpentine escapes in drying.

POISONOUS SODA.—A matter of some interest in the use of soda has recently been discovered by the well-known scientist, Dr. Fresenius. The Doctor has ascertained that much of the soda that is used for baking, contains arsenic, and he traces its source through a curious history in the manufacture of this drug. Sulphuric acid is largely made use of at alkali works; and this acid in turn is made extensively from pyrites. There are some new works of the kind started in the Highlands on the Hudson where a bed of pyrites has been found. But almost all pyrites contain arsenic which remains as an impurity in the acid; to be passed over into the carbonate of soda, when used for that purpose; and sulphuric acid is used for so many things that are freely consumed by man, the discovery is one of no little importance; and it is to be hoped that manufacturers will take special pains to have the arsenic eliminated.

WHAT EATS FARMERS UP.—The fences of the United States are estimated to have cost more than the houses, cities included; more than the ships, vessels and boats of every description which sail on the ocean, lakes and rivers; more than our manufacturing, with all their machinery, and more than any one class of property, real estate excepted. These are curious facts, but they are facts nevertheless. The fences of New York are put down at \$144,000,000; those of Ohio at \$115,000,000, and Pennsylvania at \$120,000,000. Divided out at this rate, the money invested in fences alone is more than equal to the national debt. As fences require to be renewed, on an average, once in ten years, the annual cost to the country is not far short of \$200,000,000.

A CHEAP WAY OF PUTTING UP ICE.—A resident of Taunton, Mass., has obtained his ice for summer use, for several winters past, in the following manner: Procuring about fifty empty flour barrels, at a cost of twenty cents each, he gradually pours in water until each contains a solid mass of ice. The barrels are then put away in his cellar and entirely covered with sawdust. As ice is required, a barrel is opened.

EMIGRANTS.—A party of English emigrants have purchased 5,000 acres of land near Nashville, Tenn., for \$2 per acre, with five years in which to pay it. The company numbers 1,300 persons in all—farmers and mechanics. With such propositions coming from the older States, California will have to make higher bids than she has yet offered to secure anything like a large immigration.

A SEVEN YEARS' PUMPKIN.—The *Register*, published at Blair, Nebraska, says that Mr. J. M. Filson, of Tehamah, in that State, is raising a kind of pumpkin which will keep sound for seven years. It looks somewhat like a mottled squash; but it is a genuine pumpkin, firm-grained and spicy, and just suited to the lovers of good pumpkin pies.

MOTION CONVERTED INTO HEAT.—When leaden rifle bullets are fired against iron targets, the lead is melted and spattered upon the target in the form of a star. This fact is stated as the result of careful experiments recently made at Basle, in Switzerland.

CASHMERE GOATS IN THE MOUNTAINS.—Moses Allen, of Miners' Ravine, in the lower end of Placer county, has a flock of Cashmere goats. He says it costs no more to raise a goat than a chicken.

A NARROW GAUGE RAILROAD IN TENNESSEE—A railroad thirty inches wide and eleven miles long, is to be built in Greene county, Tennessee, at the cost of \$20,000. The rails are of wood, and to be stripped with iron.

THE NORTHERN PACIFIC.—Jay Cooke expresses the opinion that the Northern Pacific Railroad will be in running order within four years.

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARR before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Water—Extraordinary Properties.

LECT. III. Mar. 4.—I remember hearing many years ago, said the Professor, the composition of a school-boy on Water. "Water," it was said, "is a very useful thing for vessels to sail on, for ducks to swim in; it is very useful to wash with and to cook with; and in some countries it is used to drink." This was many years ago. Now, doubtless, the writer would say, that if it was not used largely to drink, it is found very useful for adulterating drinks.

Water is a very common substance. It covers nearly three-quarters of the surface of the globe. It exists in plants and animals. Three-quarters of our bodies consist of it. It forms much the largest proportion of all organs. It is a most essential material, for many of the elements required to form substances must be brought into the closest contact with one another to combine, and water presents the medium by which this contact can be effected. It exists in the atmosphere, sometimes in very large relative amounts.

Water has some extraordinary properties which we, perhaps, do not always recognize. Thus, it is perfectly tasteless and inodorous. Were it otherwise, it would interfere with the operations carried on in the bodies of all sensitive animals. As it is, it passes all over our bodies, meeting every organ, without producing the slightest irritation. It is a substance which requires more heat than any other known liquid substance to keep it at a certain temperature. Take quicksilver and water, for instance. It takes 30 times as much heat to elevate water through any given number of degrees of temperature, than it does to do this for mercury. About a thousand degrees of heat must enter into water to convert it into steam which has the same temperature as the water. This great capacity of water for heat is the reason why there is nothing so cooling as is this liquid. There are many other properties, of which I have no time to speak now.

Its Composition.

Water is composed of two elements,—oxygen and hydrogen. Of oxygen I have have spoken in a previous lecture. It is a gas, you will remember, which has never been reduced to a liquid form. Hydrogen is another gas, and this forms one-ninth of all water. We can obtain it more readily from this than from anything else, although it occurs in very many other substances, as in the flesh of all animals, in the woody fibre of all plants, starch, sugar, etc., etc. We get it, however, more readily than in any other way from water by adding a substance which will take up the oxygen of the water, when, of course, the hydrogen is set free.

For instance, I have here a piece of potassium. Potassium has a great affinity for oxygen, with which it unites to form potash. So strong is this affinity that potassium will take away the oxygen from water. Thus, I throw this little piece on this water. You see that it bursts into flames, swimming about on the surface. It has seized the oxygen with such force that light and heat are produced, hence the flames. The hydrogen is set free, but so great heat is produced by the union of the potassium and the oxygen, that the hydrogen immediately unites with the oxygen of the air and forms water again.

To obtain the hydrogen, therefore, I must perform this experiment where there is no air present, as under water. I have here a cylindrical vessel which I filled with water and carefully placed in an inverted position in this pan of water. It is still full. I wrap a piece of potassium in paper (that the water may not get at it immediately) and put it in the water under the vessel. It burns as before, the hydrogen rises up in the vessel, pressing down the water. The white fumes are the vapor of potash and are quickly absorbed in the liquid.

You can see nothing in the upper part of the vessel,—only that the water no longer fills it; for hydrogen is colorless and transparent. But oxygen and nitrogen and carbonic acid, as I showed in former lectures, are also colorless and transparent. I remove the vessel, letting the water fall out, keep it still inverted, and insert a lighted taper. The gas burns with a slight explosion. It differs then from oxy-

gen, for it burns itself, while oxygen makes other bodies burn; and from nitrogen and carbonic acid, for these extinguish a flame. In the explosion, hydrogen took oxygen from the air, forming water.

We can obtain the hydrogen from water easily in other ways. In this bottle I have pieces of metallic zinc. I now pour in sulphuric acid and water, about one measure of acid to four of water. The boiling or effervescence is caused by the evolution of the hydrogen gas. The oxygen of the water has united with the zinc, forming zinc oxide, and the sulphuric acid has united with this, forming sulphate of zinc, and the hydrogen is set free.

Properties of Hydrogen.

Hydrogen is lighter than any other known form of matter. It is often used to inflate balloons. I close the bottle with a cork which has a glass tube, open at both ends, passing through it. The hydrogen passes out through the tube. I connect a rubber tube with the glass one and with this clay pipe. Now with these soap-suds I can make soap-bubbles, filled with hydrogen. The bubbles rise up in the air. Blowing soap-bubbles with the breath, they fall to the ground.

I invert this glass jar and place it over the glass tube. It fills with the gas. I insert a lighted candle into it. There is an explosion and the hydrogen burns at the mouth of the jar (where it is in contact with the air), but passing the candle up into the gas, the flame is extinguished. There is no oxygen, no air holding oxygen there, consequently it cannot burn; for hydrogen will not support combustion of itself. Taking out the candle, it is lighted again by the flame at the mouth of the jar. When all the hydrogen is burned, there is seen considerable moisture inside. This is the water formed by the union of hydrogen and oxygen.

The heat of burning hydrogen is very intense, hence the vapor of water, or steam, produced is very hot,—2,000° perhaps. I fill this metallic cylinder, closed at the upper end, with hydrogen, mix air with gas in the proper amount (about 9 parts air to one part hydrogen) to form water, and close the tube tightly with a cork. I bring a light to this aperture, near the top of the tube, which I have hitherto closed with my thumb. There is a heavy explosion and the cork is violently ejected; for the steam was formed and expanded instantaneously with great force.

Thus you see we have in water a substance which, when our coal-beds are exhausted, can be made to supply heat for all time. The only trouble is to find an economical method of getting it out. Undoubtedly some one will in time find such a method.

Impure, Poisonous Water.

Water, as I said, contains oxygen and hydrogen. This is pure water. But all water is not pure, but often has, besides these constituents, more or less foreign substances dissolved in it. Rain, in its fall, takes up many gases which are diffused in the atmosphere. It holds air, and the air we find in water in such circumstances contains about twice as much oxygen as the air we breathe. This is because water dissolves oxygen to a greater extent than it does nitrogen. As every animal needs oxygen in order to live, were this not the case the inhabitants of the water would not be able to exist. If we expel the air from water by boiling, and place a fish in the liquid, it will die. Water also dissolves, out of the atmosphere, carbonic acid and ammonia,—which are required for plants.

Water often contains organic substances which it gets from decaying vegetable matter, which is soluble to some extent. Sometimes it is so impure with them as to be poisonous. When objects decay, a little carbon is gradually taken out and pieced with a little oxygen, and a movement of the particles of the object takes place; and if these are brought into the stomach, or placed in contact in certain cases with the fluids of our bodies through a scratch or wound, this movement, or at least a *something*, is communicated, and our bodies decay,—we are poisoned. [Our readers will find another theory on this subject in the SCIENTIFIC PRESS of Oct. 22 and 29, 1870.—Eds. Press.]

Now we can purify such water in various ways. One is, by boiling, for heat causes the coagulation of the albumen and albuminous substance which is taken up by the water and destroys its poisonous character. Tannic acid, which occurs in various substances and is the material used in tanning leather, has a similar effect. Sometimes the presence of leaves or bark (holding tannic acid) prevents such water from exerting poisonous effects. So we can use alcohol, or even corrosive sublimate, only an excess

of the last will make the water even more poisonous than before.

Hard Water.

Mineral substances occur in water, which is, indeed, the universal solvent, if there is any such thing. Water at different temperatures will dissolve almost any substance. When very hot, it will dissolve quartz, for instance. Moreover, the water gets many things from the atmosphere, as carbonic acid, which increase its solvent power.

The ladies especially know what effect "hard water" has on soap. Hard water is often water holding carbonate of lime in solution. The fatty acids of the soap combine with the lime and form a substance which precipitates, and we get this instead of the lather we commonly desire. I have shown you previously how an excess of carbonic acid in water dissolves to a great extent the generally insoluble carbonate of lime. Now we can get rid of this by boiling, for the excess of carbonic acid is thus expelled and the carbonate of lime is thrown down as a solid substance. The incrustation of boilers, which use hard water, is often carbonate of lime in great part. Water is often made hard by sulphate of lime, also by the corresponding compounds of magnesia.

We can often purify hard water by boiling, as just explained; or by adding lime, or soda, or potash, which combine with the excess of carbonic acid, and thus the various carbonates are precipitated.

Water at 32° Fah., congeals and expands with irresistible force. Hence in the polar regions rocks are ground up and carried off. The mechanical action of running water need only be mentioned here.

Thus you see water is a most powerful and a most important agent. It exists in our bodies where it is necessary, in order that the various operations requisite for existence may be carried on. It purifies the air and brings down food for plants. It dissolves substances and carries them off to feed animals. I have by no means told you all of the properties of water, or of all which it does; but if I have induced any one to pay more attention to the common things of life, my lecture has not wholly failed of its object.

GOOD HEALTH.

Neuralgia.

[Written for the PRESS.]

Neuralgia, from the Greek words *neuron*, (nerve) and *algos* (pain), is, as its name indicates, a condition of disease, in which pain of a sharp, darting, lancinating character is felt along the course of a nerve.

Neuralgia is confined entirely to sensory nerve tissue. In pure neuralgia, there is neither tenderness upon pressure, inflammation, discoloration of the skin over the painful spot, nor swelling. But on the contrary, there is a feeling of coldness, and a desire to apply pressure which often affords partial relief. Whenever there is heat, swelling or tenderness upon pressure over the painful nerve, the neuralgia is either associated with gout or rheumatism; or else, the pain has induced a secondary inflammatory action.

Any sensory nerve may be involved; yet, the branches of the fifth pair, which spread over the sides of the head and face, are the ones most commonly affected. Any part of the body which is traversed by sensory nerves may be the seat of neuralgic pain; consequently various names are applied to it, to indicate its local character.

Neuralgia of the head is called *nerveous headache*; of the face, *tic doloureux*; of the stomach, *gastrodynia*; of the heart, *angina pectoris*; of the back part of the thigh, *sciatica*; and of the feet *neuralgia pedis*, etc.

Since neuralgia became a fashionable disease, almost every painful affection has been called neuralgia. This is erroneous; for although it is through the nerves that pain is felt; pain from inflammation or lesion, (local injury); is notice to the brain, through the medium of the nerves, of disturbance at their extremities—the nerves simply carry the news—while in neuralgia, the nerves themselves are affected, either directly or reflexively, through the nerve centres.

In inflammation or local injury, pain is felt at the point where the cause exists; while in neuralgia the cause lies either between the painful spot and the brain, or is reflected through the nerve centers to some

nerve distant from the real affection. For example:—If a nerve is pressed or irritated, at the point of its exit from, or passage through a bony structure, pain is felt along the whole course of the nerve to its peripheral extremity; but not especially at the point of irritation.

Again:—*Nervous headache* is almost uniformly the offspring of gastric irritation or *dyspepsia*, reflected through the nerve centers, while *gastrodynia*, and *angina pectoris* frequently have their origin in irritation of the spinal cord or its surrounding meninges, or is reflected from some distant point. *Tic doloureux* (neuralgia of the face) may be caused by gastric irritation or a decayed tooth; or it may have a rheumatic or miasmatic origin.

Sciatica is frequently the offspring of rheumatism, and is sometimes so intimately connected with it, that it has been called "*sciatic rheumatism*."

Neuralgia pedis, too, is often associated with rheumatism and gout, and the pain from each is very frequently so severe, that it is difficult to determine which affection causes the suffering.

Syphilitic, syctic, scorbutic, and numerous other "blood poisons," also, very frequently, either directly or indirectly, produce irritation of the nerves and neuralgic pain. While all neuralgic pains are caused by nervous irritation, either direct between the painful spot and the brain, or are reflected back from the affected nerve through the spinal cord, and again down the painful nerve, there are many other pains, which, although not strictly neuralgic, are reflex in their operation. Consequently pain through the right shoulder attends inflammation of the right lobe of the liver; pain through the left shoulder, inflammation of the spleen or left lobe of the liver; pain in the side, in the back "low down" and through the temples and eyes, diminished or suppressed menstruation; and pain in the knee is always felt in *cacarrus morbus* or "hip disease," while the pain in the hip is either entirely wanting, or is so slight that it is scarcely noticeable.

Reflex nervous action is certainly one of the most interesting subjects for study to the physiologist and pathologist; and if it was better understood, there would certainly be no blistering, leeching and cupping, over the painful nerves, in any purely neuralgic affection.

As neuralgia is not an *idiopathic* or *primary* disease; but simply a secondary or *sympathetic affection*—not a disease; but only a *symptom of disease*—it is evident that the only way to cure it, is to remove the cause; when, as a consequence, the painful symptom ceases.

Every experienced physician knows, that neuralgia often assumes a periodical type, when the paroxysm of pain corresponds to a chill in intermittent fever. In fact, the chill is often changed to a neuralgic paroxysm by the administration of large doses of quinine—the chill is broken, but the disease is not cured—a new set of symptoms is simply developed.

Periodical neuralgia (that which comes on at a certain time of day) seems to depend upon a miasmatic influence, as truly as does the chill, and such a view is confirmed by the fact that both are promptly relieved by the same class of remedies.

Also, where neuralgia has its origin in rheumatism or gout; when they are cured there is no more neuralgia.

When the *tic doloureux* is caused by a decayed or ulcerated tooth, immediate relief is always afforded by the removal of the tooth. When, also, it is the offspring of uterine disease, it, with the weakness and irregularity, will all pass away, under proper treatment for uterine disease. Such may be said of all diseases upon which neuralgia depends. *Cure the disease, and the painful neuralgic symptom ceases.*

E. J. FRASER, M. D.

San Francisco, Mar. 10, 1871.

"Bread and butter," and milk, are the only two articles of food which have all the elements of nutrition; hence from childhood to extreme old age, we are never tired of them.

IMPORTANCE OF REVACCINATION.—There is a case on record of a woman who was vaccinated, we believe, by Jenner himself, who then resisted variolous inoculation, who some years after nursed her own children through the small-pox with impunity, and who, nevertheless, at a very advanced period of life, caught the disease from a grandchild, and died.—*Lancet*.

DEATH FROM ETHER.—A fatal result from ether inhalation has come to light in Boston, in the person of a man who had received a bullet wound in the knee.

Gold and Legal Tender Rates.

San Francisco, Wednesday, Mar. 8, 1871. Legal Tenders buying @90½; selling @91. Gold in New York to-day 111½.

Table of Contents.

The Smith Truss Bridge, Ill; Copper Mining in Cornwall; Hercules Powder.....	145
MECHANICAL PROGRESS.—Wooden Railroads; Tramway for City Streets; Spiral Cutter for Planers; Cast Rails; Safety Car Truck.....	146
SCIENTIFIC PROGRESS.—Phoenixville Bone Cave; Metaphosphoric Acid; Glaciers of the Pacific Slope; Nature of the Earth's Interior; Phosphorus Essential for Fungoid Growth.....	146
Notes on Tuolumne County; Cops District, Nevada; Right and Left; Curious Vocation; Curious Telegraph Cable Statistics; Getting Newspapers into Paris; Sale of New Mexico Mines.....	147
MINING SUMMARY; Mining Stock Market; Shareholders' Directory; Market Rates.....	148, 149
List of Patents; Notices of Recent Patents; Drawing a Circle, Ill.; Why Circles Please the Eye; Greasing Wagons; Coal near Monterey; Narrow Gauge in Tennessee.....	150
Chemistry and Its Applications; Neuralgia.....	151
Notices to Correspondents; Academy of Sciences; Gerrish and Hinkle Furnace; Separating Gold and Silver by Chlorine Gas; Mercantile Library; University of Cal.....	152
New Diamond Drill Tunneling Machine, Ill.....	153
HOUSEHOLD READING.—Domestic Industry; Make Your Own Soap; To Get Rid of Rats; Domestic Receipts; Mechanical Hints; Life Thoughts, etc.....	154
Contributions to Our Cabinet; New Window Fastener; Sheffield Scientific School; Alvarado Sugar Factory; A High Compliment.....	156

Notices to Correspondents.

AN OBSERVER sends us a long communication concerning the Stetefeldt furnace, which we must decline. We are ready to publish criticisms, but this letter contains matter which is decidedly libelous and concerning parties whom it was altogether superfluous to bring into the discussion. The characters of J. Ross Browne and the mill companies have nothing whatsoever to do with the question of the merits or demerits of any furnace. Our columns are open to the writer if he will confine himself strictly to his subject.

Separating Gold and Silver by Chlorine Gas.

We have previously described the process of separating gold and silver by means of chlorine gas, as invented by Mr. F. B. Miller, melter and refiner of the mint at Sydney, Anstralia. This process consists, in brief, of passing the chlorine into the melted bullion as long as it is absorbed by the silver, which it converts into a chloride. This last is then poured off, in a fused condition, from the gold which solidifies the more quickly on cooling, and is reduced in any one of the various methods. The gold can easily be obtained .995 fine, the loss of the precious metals is said to be very small, and the cost of refining very considerably reduced.

Mr. Miller's process was thoroughly tested at the Sydney mint about a year ago, and the experiments resulted so favorably that the method was adopted and has since been used with advantage. Then the London mint introduced it. Now we hear that Mr. Miller is engaged in setting up his apparatus at the Philadelphia mint, the authorities there having determined to examine it with a view to its adoption in the United States. All this is very complimentary to Mr. Miller.

A FOG WHISTLE has lately been made at Portland, Me., for the Lighthouse Department, which is said to be the biggest yet made in the U. S. It is an 18-inch whistle and weighs about 450 pounds.

Academy of Sciences.

Ancient Coin—Active Glaciers.

At the meeting of the Academy, on Monday, a coin was presented which was found in a Chinese Camp on Wolf Creek, Grass Valley. It is of copper, about the size of a dime, and dated 1717.

Prof. Davidson called attention to an article in the *Atlantic Monthly* for March, by Clarence King, in which the first discovery of active glaciers in the United States is claimed for his party. In 1856 or 1857, Lieut. (now General) Kautz, U. S. A., attempted to ascend Mt. Rainier, but was prevented by glaciers which he found. An account of his experience was published in the papers of the day. Mr. King, in the article alluded to, says that probably glaciers may be discovered on Mt. Baker; but a member of the Alpine club published a description, with illustrations, in *Harper's Magazine* of November, 1869, of glaciers on this mountain.

Prof. Davidson in this connection, said that he had received a letter from Prof. W. P. Blake, a member of the Academy, correcting statements which have been published to the effect that the Western Union Telegraph company's expedition made the first discovery of glaciers on the Stikoon river in 1866. Prof. Blake published, in the *Sacramento Union*, in 1863, a description of the same glaciers, and gave, in a pamphlet, drawings of them. Here, if Prof. D. was not mistaken, the existence of four or six glaciers on the right bank of the stream was noted.

The Late Eclipse.

Prof. Davidson read extracts from letters received from members of the expedition to the Mediterranean to observe the solar eclipse in December last, and gave a few of the results obtained. The expedition met with marvellous success. It might be mentioned as a flattering circumstance, that the actual time of the eclipse, as determined by the photographs, differed no more than one or two seconds from the predicted time, as calculated in Professor Pierce's tables, while it differed 100 seconds from the time calculated in the tables used by the Italian astronomers. By means of the spectroscope the time of the eclipse was also given, the first time such a thing was ever done. The arrangements of the party were most complete, and although the day was cloudy, very much was accomplished. The English expedition was very unfortunate.

The main object of the expedition was to determine the nature of the sun's corona. There have been various theories on this point. One was that it emanated from the sun; another, that it was caused by a lunar atmosphere; still another that the appearance was caused by the atmosphere of the earth. But observations several years ago proved that the moon has no atmosphere, and the last theory named has also been shown to be untenable. The corona belongs radically to the sun, and the outer manifestations are caused by our atmosphere.

It was shown, by the observations, that the corona existed to a height of at least 50,000 miles, perhaps 150,000 miles, above the sun's photosphere. It shines partly by its own light and partly by the light of the sun. This outer atmosphere, at its lowest depth, has not more than one-twentieth the density of our own atmosphere; notwithstanding its great rarity, it sustains the weight of an atmosphere at least 50,000 miles high, attracted by the immense mass of the sun. So great an elasticity denotes a great degree of heat. But is this great heat sufficient to give luminosity to this atmosphere, or are other causes combined?

A New Chemical Element.

A very interesting discovery made, was that of the existence of a new chemical element in the sun's corona. The spectrum shows a green line which has never before been observed,—given by no element or combination of elements now known. What this element is, must be determined by future investigations. The Professor described the manner in which the spectroscope is used in such cases, and how it teaches us the chemical composition of objects. He likewise made some remark concerning his own experience with it.

Grasses.

Professor Bolander stated that he had

collected 140 species of grasses on this coast since 1861. Only 14 had before been observed, owing probably to the rapidity with which observers went over the ground. Among the total number he included several species which were cultivated. He had recently found a peculiar grass, distinguished by a remarkably bright green color, the *Testuca gracillima* or Slender Fescue grass, which he believed to be identical with that found by Dr. Hooker in the straits of Magellan. It grows abundantly from Cisco to the summit, is highly prized by stock-raisers, and is to be recommended for lawns. It is also found in Chili. The Professor remarked on the number of grasses common to Chili and this coast. In his remarks, he stated that the structure of "bunch grass" is probably due to the climatic conditions; such grasses being compelled to aggregate so as to concentrate the moisture and guard against dryness.

The Gerrish and Hinkle Furnace.

In our issue of January 28th, we published a description and illustration of the smelting furnace of Messrs. Gerrish and Hinkle, of this city. As the description was written from the caveat, which is the preliminary protection granted inventors previous to their obtaining a patent, and as it is allowable for persons who have obtained a caveat to modify and work out their original plans as they may thereafter see fit, and consequently we could not know exactly what changes might be made or how far the inventors might abide by what they had, our description was necessarily only such as would give a general idea of the device.

In our issue of March 4th, we published a letter from Mr. A. J. Close, of Inyo county, (with an illustration), in which he criticized one point (as we understood it) of the construction of this furnace. As he appealed to the integrity of our Patent Agency, a reply was made to his communication. It would appear that a number of persons believe that Mr. Close claimed the whole furnace as his (instead of one point in it) which we did not so understand, and our reply was made concerning one print only, and not the whole furnace.

We have received the following letter from Mr. Gerrish in reply to Mr. Close:

EDS. PRESS.—I see, in your issue of March 4th, a communication from Mr. A. J. Close, of Inyo county, Cal., claiming that, 19 months since, he erected a furnace the same as the one claimed by Mr. H. Hinkle and myself. I have examined the illustration of his furnace, and must say that I cannot see any similarity to ours. His is a shaft, eight feet high, covered with a hood, and connecting by means of a flue with the chimney. Ours is a shaft, 20 feet high, all supported on posts and plates, with an arched canal or flue leading into a shaft in which falls a continuous shower of water for the condensation of the fumes, and thence uncondensable vapors escape into the stack. The ore is fed into the shaft 18 feet from the bottom. At the height of 12 feet, the shaft is one-third larger than at the feed-hole or at the bottom, giving the ore opportunity to calcine before reaching the smelting zone.

The furnace described by your correspondent, in my opinion at least, cannot be used for smelting raw ore, which will have to be previously slagged. The statement that nothing was found in his flue is, I presume, correct, as silver, lead, antimony, when once volatilized, will not condense until cold. You might as well try to cleanse the Sacramento River by crooks in its course, as to condense fumes with crooked flues.

But it is a well-known fact that 25 per cent. of lead and silver have been lost by smelting in Nevada. I was informed by Messrs. Ogden & Co., of Eureka, Nev., that they had assays of settlings in the vicinity of their works, which often gave \$80 per ton; and some of the Eureka company assured me that they talked of erecting a flue to connect with condensing chambers in the hill near the furnace. This loss of metal is confirmed by universal experience.

There are other reasons than saving all the metal for using our condenser. It catches the arsenic and other poisonous matter; and some ores contain enough arsenic in a ton to destroy a whole village. I have seen in Europe all of the trees killed for miles around from the fumes of furnaces. The water can also be made, by proper means, to combine with the sulphur

to form sulphuric acid, which is valuable for working copper ores, for instance. Finally, as claiming the posts of a furnace, I should as soon think of claiming the brick. If your correspondent will wait, he will before long see our claims in point.
G. M. GERRISH.

It has been inferred by some, we are told, from our comments, that we expressed an opinion that the Gerrish and Hinkle furnace was "old," had nothing novel in it. Such was not at all our meaning. We referred in all our remarks only to the one point of the supporting of the upper part of the shaft. This, as we said, has been effected one way or another for years; but still if any one can invent a new way he can patent it. And we cannot know but what Mr. Gerrish or Mr. Close or somebody else may hereafter find out some such novel method.

University of California.

The Board of Regents met on Wednesday, the 8th inst. The professors of the Medical Department, elected in consideration of Dr. Toland's offer of his building, tendered their resignation on these grounds; "After the acceptance of his terms by the Regents, Dr. Toland refused to convey the property except on terms which were not only new but entirely inadmissible. It therefore seems to us but just that the Regents should be released from all embarrassment by reason of our election under these circumstances."

On the recommendation of the proper committee, resolutions were adopted to this effect, that the Regents of the University will establish a Board to be known as "The Board of Medical Examiners of the University of California," and will annually appoint the members of said Board, whose duty it shall be to examine all students applying for a medical diploma from the Medical Colleges of the Pacific States and Territories. Also, that the Regents will confer degrees upon such students of medicine as may be recommended therefor by the Faculty of their respective colleges, and whom the Board of Medical Examiners shall report entitled thereto, and upon none others.

Besides the financial business transacted, the quarterly report of President Durant was received and referred to the Committee on Instruction. A resolution was passed inviting the Society of Associated Alumni of the Pacific Coast to hold their next annual meeting in connection with the Commencement exercises of the University on the 19th of July. According to the President's report, the total number of "students" in the University is 788, including 501 who attend the special course of lectures before the Mechanic Arts College in this city, and about 200 in the Fifth Class.

MERCANTILE LIBRARY.—We have received the sixteenth, seventeenth, and eighteenth annual reports of the Mercantile Library Association of San Francisco, for the years 1868, 1869, and 1870. The President gives a review of the affairs of the institution during these years, and the Librarian gives a statement of the operations of the various departments of the Library during the same period. It appears that the whole number of members at present belonging to the association is 2,020, of whom 337 are Life Members, 78 are Honorary Members, and 1,605 Subscribing Members. The whole number of volumes at present owned, is 30,002. The Treasurer's report shows a balance in favor of the Library of \$19,288. Mr. R. B. Swain says, in the conclusion of his report:—"With a revenue exceeding the expenses about \$1,200 to \$1,500 a month, which will be increased, it is hoped, by an increase of membership, I see no reason why this Association may not become one of the most prominent literary institutions of the country. It is for members, as well as the public at large, to decide how soon it shall reach so exalted a position."

A RAILROAD is proposed from Santa Cruz to Gold Gulch, a distance of eleven miles, to be constructed this summer.

A New Tunneling Machine.

All of our readers are undoubtedly familiar to some extent with the diamond drill. We described the various machines of Messrs. Severance & Holt in the Press of May 7th, 1870, when they were introduced for the first time on the Pacific Coast. We need not, therefore, give any further details now concerning the drill, except as far as new improvements have been made.

The value of black diamonds for cutting rock has been well demonstrated during the last ten years. The main difficulty in bringing them into general use has been in regard to feeding or advancing the

it has succeeded. In this rock on the New Haven and Willimantic R. R., where only 8 to 12 feet of drilling could be made by hand in one day by three men, the machine drilled 30 to 36 feet. At Hell Gate, New York Harbor, it gave very interesting results. At Clinton Gulch, Colorado Territory, by means of this drill a hole was made 417½ feet horizontally, and a core brought out so as to show the nature of the rock for the whole distance. In this last case, the machine was placed in the tunnel 600 feet from the outer air, and was driven by compressed air.

Since the report was written, in the iron beds of New York, a depth of 447 feet has been reached, and in Pennsylvania, the

pany to improve and oversee the construction of their drills and machinery. By this construction, the drills can be moved to any point in the face of the tunnel without disturbing the position of the machine. The machine has been on exhibition at the Fulton Foundry, in this city, where it was manufactured, and of this machine we give now an illustration and description.

The engines, A, are of the ordinary construction and drive the wheel, B, which gears into the wheel, C, for driving the two lower drills, and the wheel, D, for driving the two upper drills. The other parts are merely repetitions in the case of each individual drill, and hence it suffices to describe those of any one drill. We take in this case the upper right hand one, as showing most clearly the details in the cut.

The wheel, D, then, drives the friction

down on R, and the bar, R, carrying G and the whole driving arrangement, can be moved horizontally on S. By this construction the drills can be directed to any desired point whatsoever on the face of the tunnel with the greatest ease. For the sake of illustration, in the engraving, the drills are shown in four different positions, I being at the highest point, where it can bore close to the roof, and I', at the lowest point, boring at an even lower level than the track.

When the screw-shaft, M, is fed in its whole distance, in order to run it back it is only necessary to release the friction-nut holding N, and to hold the feed-shaft, O, when the screw-shaft runs up with the same motion of the engine which carried it down, but with a velocity sixty times greater; that is, the speed with which the drill leaves the rock, bringing the core with it, is to the

NEW DIAMOND-POINTED DRILL TUNNELING MACHINE, MANUFACTURED BY SEVERANCE, HOLT & CO.

drill. Messrs. Severance & Holt, the assignees of the patent for the United States, have long been at work to overcome this difficulty, and their efforts have certainly been crowned with success to a very great degree. We find their machines mentioned favorably in all publications which treat of such matters. We might refer, for instance, to that part of Commissioner Raymond's last report, which considers the mechanical appliances of mining, which was very carefully prepared by Prof. W. P. Blake. We make a few (condensed) extracts therefrom with regard to what has been done.

The annular diamond drill, it says, has been used for testing the nature of the rocks at considerable depths in many places, and it is evidently destined to be of very great service to mining industry. Holes have been repeatedly bored, and cores extracted, from depths of 300 to 400 feet. At the lead mines in Missouri, the sandstone quarries in Connecticut, the iron beds of New York, the coal beds of Pennsylvania, depths of 150, 312, 340 and 274 feet, respectively, were reached, and the existence and nature of valuable deposits (sometimes not before known) were tested and proved. In hard trap rock in which hand drilling had proved a failure,

drill has bored holes to a depth of 750 feet!

During the past year, the owners of this invention have been using their machines in various portions of California for prospecting purposes and for boring artesian wells. In Tuolumne county, they bored seven perpendicular holes through hard talcose slate, porphyry and sandstone, varying in depth from 30 to 157 feet, bringing out a perfect core showing the stratification and nature of the rock through which the drill passed. In Calaveras county, the same machine was equally successful, the holes here being drilled at an angle of 45°, through rock largely composed of crystalline quartz, and reaching a depth of 100 to 330 feet. In San Francisco and Marin counties, a different style of machine, having, however, the same boring apparatus, was used for artesian wells, reaching down from 100 to 327 feet. They are now working prospecting drills in Monterey county and in other portions of the State.

Messrs. Severance & Holt are constantly improving their machinery and adapting their drills to the peculiar conditions of the various localities. Since coming to this coast, they have been induced to provide several forms which would apply more particularly to the special needs of our miners. They have just now completed an improved tunnel drill for the Blue Gravel Mining Company at Smartsville. This has a new style of adjustable attachment which was invented by the chief engineer, Mr. N. W. Robinson, who is employed by the com-

pany to improve and oversee the construction of their drills and machinery. By this construction, the drills can be moved to any point in the face of the tunnel without disturbing the position of the machine. The machine has been on exhibition at the Fulton Foundry, in this city, where it was manufactured, and of this machine we give now an illustration and description. The engines, A, are of the ordinary construction and drive the wheel, B, which gears into the wheel, C, for driving the two lower drills, and the wheel, D, for driving the two upper drills. The other parts are merely repetitions in the case of each individual drill, and hence it suffices to describe those of any one drill. We take in this case the upper right hand one, as showing most clearly the details in the cut. The wheel, D, then, drives the friction

clutch, E, which is thrown in or out of gear by means of the lever, F. By means of beveled gear, as shown, the upright shaft, G, is actuated, and through this the gear, A, which drives the gear, H, and thus the screw-shaft, M, with the drill, I, passing through it as denoted in the engraving. A coarse thread is cut on the outside, and nearly the whole length, of the shaft, M, which carries a spline by which it is feathered to the sleeve-gear, H. This sleeve-gear is double and connects by its teeth, H, with the beveled driving gear, A, and by its teeth, h, with the release gear, N, on the feed shaft, O. On the other end of this feed shaft is the gear, P, fitting the nut nut gear, P, whereby a differential feed is produced.

There is a friction-nut which holds the release gear, N, and thus is obtained, in connection with the above, a combined differential and frictional feed, which renders the drill perfectly sensitive to the character of the rock through which it is passing, and maintains a uniform pressure upon the same. The severe and sudden strain upon the cutting points, incidental to drilling through soft into hard rock with a positive feed, is thus avoided.

By means of a nut at K, the drill can be held in any desired horizontal position to which it may have been adjusted, and by means of another nut (not visible here, but indicated on another drill by L), the same is possible for any vertical position. Again, the bracket, Q, to which is attached the screw-shaft, M, with all the gearing connected therewith, can be moved up and

speed with which it penetrates it as sixty to one—the revolving velocity in both cases being the same.

The machine is well constructed in all its parts and reflects credit on its inventor and its builders. It is mounted on wheels which are actuated by proper connections from the cranks, T. When in position, the wheels are held firm by the brakes above them, and the machine is perfectly steady. Each drill, we must not forget to state, runs independently of the others and can be stopped or started without interfering with the others or stopping the engine.

The motive power can be either steam or compressed air, but naturally in a tunnel, air is decidedly preferable for obvious reasons. Proper compressors are supplied with this device.

The machine has been on exhibition at the Fulton Foundry, where we have seen it in operation once or twice. It ran remarkably steadily and did good work, boring in hard sandstone, and in Chinese and Folsom granite at the rate of one to two and a half inches per minute. It has been examined by a number of persons versed in mining and other engineering works, and we have heard none but favorable opinions expressed concerning its work. To attend the drills, only two men are required.

This machine will soon be in operation at Smartsville, where undoubtedly full reports of its work will be published. Messrs. Severance, Holt & Co., 318 California street, are owners of the patent rights of the diamond drill, and may be addressed for particulars and terms concerning their machine.

HOUSEHOLD READING.

Domestic Industry.

As the forest furnishes timber, and the quarry stones in the rough, which must be hewed and polished before either is fit for use; so Nature, cultivated, furnishes food, which art must dress and prepare, before it is suitable for the palate or digestion; and so essential to our welfare and happiness is this preparation, that we have ever wondered why such work was so persistently made menial.

It requires no elaborate reasoning to show that every mother, wife and daughter should become a practical worker in the domestic circle. The days for romance have passed, the night for dreamy visions of elegance and luxury, in connection with a life of idleness, is, or should be giving place to the dawn of industry and utility.

It is well that woman should be queen in the parlor; but she should also be able, if need be, to be queen in the kitchen. The more gracefully she is able to perform the duties of mistress of an establishment; with so much the lovelier grace will she be able to perform whatever less pleasant duty circumstances may require of her.

The services of a good cook are essential to good health, good temper, and the fullest enjoyment of peace and quiet in any family. The art of cooking, so far as real happiness in this world is concerned, is superior to all other arts; and should be made as much a study, by our daughters, as any other.

Labor should not be held in disrepute by any one. The written word:—"In the sweat of thy brow shalt thou eat bread," should not be considered so much a penalty, as a blessing. The labor which is necessary to produce the "sweat" is the means of invigorating the body; without such labor, in some form, the blessings of health cannot be enjoyed. It is a false sentiment which suggests "exercise" instead of "labor;" the latter is the true and honest term—and it should be considered all the more honorable if connected with utility. We never could hammer a log with the back of an axe, for "exercise." We always preferred to use the cutting edge, with which to make the chips fly, and thus unite utility with our labor. We have ever preferred the buck and saw, interchanged with the hoe and spade and the pump-handle, to dumb bells; and though at the age of almost threescore years, we have not yet seen the folly of our choice, and never expect to.

The word "thy," as quoted above from Holy Writ, is generic, and stands for both sexes. Will not the ladies, whose opinions and actions more especially mould public opinion, endeavor to effect a reform in the industry and economy of social life? They can do it if they will—make idleness and indolence disreputable, and labor and usefulness honorable. The kitchen and the garden present to them the most accessible and useful field in which to work out the problem.

BE CORRECT.—Few persons engaged in domestic matters are aware how much mischief is often done by even very small deviations from the proper rule of cooking. To illustrate—A lady in measuring out the ingredients for a batch of cake, had a small quantity of flour left. She deliberated a moment, then tossed the flour into the cake, saying; "It is too much trouble to go back to the pantry with such a little mess—just that little won't do any harm." But it did—destroying the proportions and spoiling her cake. Receipts are often found fault with, and thrown aside as worthless when the blame lies in the unexact manner in which they are followed. If anything is worth doing at all, it is worth doing well.

Make Your Own Soap.

Every farmer and every family, indeed, has a large amount of grease and drippings, more than enough to make all the soap needed for the family. The manufacture of your soap is a great piece of economy, and it is easily done—even to nice toilet, fancy and shaving soap. We append hereto

How to do it.

Take the best hard wood ashes, which must be kept dry while saving them. When put in the hopper, mix a bushel of unslacked lime with ten bushels of ashes; put in a layer of ashes; then one slight sprinkling of lime; wet each layer with water—rain or river water is best. A layer of straw should be put upon the bottom of the hopper before the ashes are put in. An opening in the side or bottom for the ley to drip through, and a trough or vessel under to receive the ley. When the ley is strong enough to bear up an egg, so as to show the size of a dime above the surface, it is ready for making soap: until it is, pour it back into the hopper, and let it drip through again. Add water to the ashes in such quantities as may be needed to keep them dripping. Have the vessel very clean in which the soap is to be made. Rub the pot over with corn meal after washing it, and if it is at all discolored, rub it over with more until the vessel is perfectly clean. Melt three pounds of clean grease; add to it a gallon of weak ley, a piece of alum the size of a walnut. Let this stew until well mixed. If strong ley is put to the grease, at first, it will not mix well with the grease. In an hour add three gallons of strong ley; boil briskly, and stir frequently; stir one way. After it has boiled several hours, cool a spoonful upon a plate; if it does not jelly, add a little water; if this causes it to jelly, then add the same proportion of water to the kettle. Stir quickly while the water is poured in, until it ropes on the stick. As to the quantity of water required to make it jelly, judgment must be used; the quantity will depend upon circumstances. It will be well to take some in a bowl, and notice what proportion of water is used to produce this effect. You will now have soft soap.

To Harden it: Add a quart of salt to this quantity of soap; let it boil quick, ten minutes. Pour it into some suitable vessel, so that when the soap is cooled, (which will be in about 24 hours) it can be turned over, and the vessel be drawn away, leaving the soap in a mass, corresponding to the interior of the vessel. It can now be cut into cakes or bars, with a string, when it will be ready for use.

To Prepare it for the Toilet: Scrape off all sediment; shave it very thin; put it in a tin-pan, and hardly cover it with water. Set it on the fire; mash it to a jelly, and perfume with lavender, sassafras, or anything preferred. It will be nicer if it is melted in water and cooled two or three times before shaving it.

Soap will improve by age if kept well boxed in a cool, dry place.

How to Get Rid of Rats.

Somebody has suggested, what we should think might be a very effective, safe and economical method of getting rid of rats. If it works well with rats, why not equally well with gophers? Will some one try it for both purposes and report success or otherwise to the *RURAL*, for the benefit of others.

Put potash in their holes and paths. The rats will get it on their feet and over their fur, then lick it, not liking the taste of it, as it burns them somewhat. The more they see of it the less they like it, so they clear out almost as soon as the application is made.

Somewhat similar to the above, and also safe, has been suggested as follows:

To rid your premises of rats, powder the holes well with dry cayenne pepper. It will get into the eyes and nose, and the same rats will never be seen there again. Mice may be treated in the same manner. And why not gophers and squirrels?

To Clean Black Cloth.—Dissolve one ounce of bicarbonate of ammonia in one quart of warm water. With this liquid rub the cloth, using a piece of black cloth for the purpose. After the application, clean the cloth well with clear water; dry and iron it, brushing the cloth from time to time in the direction of the fibre.

OBJECTS seventy-two feet long can be distinctly seen on the surface of the moon by great telescopes of the Earl of Rosse and Lord Oxmantown.

Domestic Receipts.

AN EXTRA DISH.—Oranges peeled and divided at the natural partings; three whites of eggs, for two oranges, beaten to a stiff froth, and the pieces of orange slipped in. Then thickly dusted with sugar and baked.

GERMAN LOAF CAKE.—Make a sponge the evening before you wish to bake the cake, of a tea-cupful and a half of milk, and as much flour stirred into it as will form a thick batter, with a little salt and one gill of good yeast. In the morning this sponge should be light. Then beat a quarter of a pound of butter with half a pound of sugar, until light. Add to it two tablespoonfuls of cinnamon, a pound of dried currants. Put the whole into the sponge, with flour enough to form a soft dough. Butter a pan, and, when it is light, bake in an oven about as hot as for bread.

To Dress Cold, UNDERDONE BEEF.—Cut it in thick slices; season well with pepper and salt; dredge with flour, fry in hot lard to a light brown. Then take the slices out of the lard, lay them in a stew-pan, and pour over them half a tumblerful of hot water. Now rub a teaspoonful of flour into a tablespoonful of butter and put the same into the pan. Stew with the cover on, a quarter of an hour. Then season the gravy with catsup, to your liking and pour over the meat. Serve hot and your meat will be as good or better than when first stewed.

To Keep Fish FRESH.—After cleaning the fish, and wiping dry, sprinkle it thoroughly with black pepper, fine salt and brown sage.

To Pickle Onions.—Do not put into vinegar direct; but first, after peeling, boil in milk and water for ten minutes, then drain off the milk and water and pour over the onions cold spiced vinegar.

Mechanical Hints.

Absorption of Bricks.—A dry common brick will absorb at least a pint of water. Pressed brick will not absorb one-half as much, being harder and more compact. From this fact one can form some idea of the amount of moisture retained in a brick after a heavy shower, or more especially during the rainy season. Paint fills the pores of the brick, and forms a covering or metallic coating which effectually prevents absorption.

VARNISH FOR SHOES.—Put a quarter of a pound of gum shellac, broken up in small pieces, in a pint bottle, cover it with alcohol, cork it tight, and put it on a shelf in a warm place; shake it well, several times a day, then add a piece of camphor, half as large as an ordinary sized hen's egg; shake it well and in a few hours shake it again, and add half an ounce of lampblack. If the alcohol is good, it will be dissolved in three days; then shake and use. If it gets too thick, add alcohol, pour out two or three teaspoonfuls in a saucer, and apply it with a small paint brush. If the materials are good, it will dry in about five minutes, and will be removed only by wearing it off, giving a gloss equal to patent leather. The advantage of this preparation over others is, it does not strike into the leather and make it hard, but remains on the surface, and yet excludes the water almost perfectly. The preparation is admirable for harness and does not soil when touched, as lampblack preparations do.

USE OF SULPHATE OF BARYTA IN WHITE WASHING.—Sulphate of baryta, or the so-called "fixed white," is strongly recommended as a substitute for lime in white-washing. For this purpose an ounce of glue is to be softened for some hours in cold water; and afterward heated in a water-bath with a quart of warm water, until completely dissolved. At the same time six or eight pounds of fixed white are to be stirred up with warm water in another vessel to a kind of milk, and the two poured together, and applied warm with a white-wash brush or otherwise.

JORDAN'S WOOD CARVING MACHINE.—Jordan's original carving machinery was invented in 1845, and received the gold medal of the Society of arts in 1847. A number of the machines were put in action in 1846, on the carved decoration of the houses of Parliament, and continued to be used during the progress of that work. The same machines are now employed by a large number of firms in England. The inventor still continues to build them, and has recently introduced a smaller one for amateur carving, which, like the original, has the power of carving the entire round figure, or any extent of undercutting, which can be effected by hand carving. This machine is a great labor-saver.

Life Thoughts.

God thinks more of the good than of the world-popular.

HOPE is the dawn of joy, and memory its twilight.

THERE is no shady side to the pathway of duty.

EDUCATION is the chief defense of nations.

THE deepest love shows itself in the eye and touch.

"Little children loved him," is the only epitaph I care about.

"THERE is nothing great on earth but man; there is nothing great in man but mind."

It is always in our power to make a friend by smiles; what a folly, then, to make an enemy by frowns.

SLOTH makes all things difficult, but industry all easy; and he that rises late must trot all day, and shall scarce overtake his business at night; while laziness travels so slowly, that poverty soon overtakes him.

MAN was never intended to be idle. Inactivity frustrates the very design of his creation; whereas an active life is the best guardian of virtue, and the greatest preservative of health.

SATIRE is a sort of glass, wherein beholders generally discover everybody's face but their own, which is the chief reason for that kind of reception it meets in the world, and that so very few are offended with it.

EXEMPTION from care is not happiness; on the contrary, a certain degree of care is essential to promote enjoyment.

INFINITE toil would not enable you to sweep away a mist, but by ascending a little you may often look over it altogether. So it is with moral improvements; we wrestle with a vicious habit, or with a slanderous report, which would have no hold upon us if we ascended into a higher moral atmosphere.

Aim at Something.

Multitudes of men *relax* nothing, because they *devise* nothing—*perfect* nothing, because they *project* nothing. "They simply float on the surface of the occasion and trust to the sublimity of luck." Micawber-like, they are "waiting for something to turn up."

He is a most unreasonable man, who expects to achieve, by accident, that which every successful man achieves, only, of set purpose. He is more unreasonable, who enters a bill of indictment against Fortune, for being so hard with him, when he is so hard with himself. He upbraids poor blind Fortune, because she does not come and heap upon his head a lap-full of good things, while, really, he does not a single good thing for himself.

A marksman will tell you, that if you would hit the target you must aim at it. No random shots are expected to "drive the cross"—it will not happen once in a million of chances, especially if there be no idea of the direction in which it lies. Yet there are thousands of good, easy people—credulous, sanguine souls—who expect to hit the mark, not only without taking aim, but without shooting at all.

We should say, that with this class of persons there is an overgrowth of hope. They have been indulging high hopes all their lifetime and have not realized one of them. Is it not strange that they do not grow weary of their vain hopes and try some other expedient? The truth is, we suspect, they have reached the conclusion that it is easier to hope than to work. In their present aimless, do-nothing calling, the outlay is but little or nothing, and although the income be nothing, it is pretty good considering that there is no investment, and no risk at all, except the risk of a slight disappointment.

GOLDEN OPPORTUNITIES.—As wealth is for the most part accumulated by the constant saving of small sums, so knowledge is acquired by constant, though it may be almost imperceptible acquisitions. "Line upon line" is the one sure way of conquering the difficulties that lie in the path. The saving of time, even its moments, is an important element. Some wait for great opportunities, suffering the days, months, and even years, to pass away in mere resolves to become learned. The choice of a profession, a calling, or an object of attainment in the pursuit of knowledge, and not a resolution to work, merely, but a working on, in season and out of season; saving moments is the surest way to reach the goal.

The California Powder Works

No. 314 CALIFORNIA STREET.
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER,
Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN P. LOHSE, Secretary.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

El Refugio Petroleum Company,---Location
Santa Cruz County, State of California.

Notice.—There are delinquent upon the following described Stock, on account of assessment levied on the Eighteenth day of January, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Geo. L. Smith.....	4	30	\$19 50
J. A. Zimmerman.....	6	20	13 00
C. Christensen.....	100	100	65 00
W. H. Thibault.....	17	100	65 00

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of January, 1871, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction, at the office of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Tuesday, the 14th day of March, 1871, at the hour of 1 o'clock P. M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary.
fe25 Office, 414 California street, San Francisco, Cal.

North America Consolidated Mining Com-
pany.—Location of works, White Pine Mining District, County of White Pine, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of February, 1871, an assessment of Five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the Company's office, Room 8, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 29th day of March, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 29th day of April, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,
WM. H. WATSON, Secretary.
Office, Room 8, No. 302 Montgomery street, San Francisco, Cal. fe18-6w

Stockholders' Meeting—Globe Gold and Silver Mining Company. Special meeting of Stockholders.—Location of mine and works, Monitor District, Alpine County, California.

Notice is hereby given, that a special meeting of the stockholders of the Globe Gold and Silver Mining Company will be held at the office of the company, 47 Bryant street, San Francisco, on Monday, the 13th day of March, 1871, at 11 o'clock A. M. of that day, to act upon a proposition to remove the principal office of the company to Monitor, Alpine County, California, and for the transaction of such other business as may properly come before it. Dated at San Francisco, February 8th, 1871.
J. WINCHESTER,
S. SHAFER,
H. WINCHESTER,
Majority of the Board of Trustees of the Company.

And in accordance with law, and an order of the Board of Trustees, made on the Nineteenth day of January, 1871, so many shares of each parcel of said Stock as may be necessary, will be sold at the office of Maurice Dore & Co., Room 21, Hayward's Building, 419 California street, San Francisco, California, on Friday, the 17th day of March, A. D. 1871, at the hour of 1 P. M. of said day, to pay said delinquent Assessments thereon, together with costs of advertising and expenses of the sale.
CHAS. E. ELLIOT, Secretary.
Office, Room 21, Hayward's Building, 419 California street, San Francisco, Cal. fe25-5w

Eagle Quicksilver Mining Company—

Location of works, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of February, 1871, an assessment of twenty-five (25) cents per share was levied upon the mines of said company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Room 8, No. 302 Montgomery street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Tuesday, the 4th day of April, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of April, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,
WM. H. WATSON, Secretary.

Office, Room 8, No. 302 Montgomery street, San Francisco, California. fe11-5w

Mountain City Mining Company—Location

of mines, Cope District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of February, 1871, an assessment of twenty-five (25) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 205 Front street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the Twenty-seventh (27th) day of March, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the Seventeenth (17th) day of April, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,
T. B. WINGARD, Secretary.

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities.

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-4f

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at
the Paris Exposition.

Patented Nov. 1st, 1864; July
21, 1866; and Oct. 9, 1866.

ADAPTED

FOR

Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of
Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's
Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as
certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior
construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low
Pressure Steam Engines, Steamboats and Propellers, made at short notice.
For circulars and further information address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

v18-3m

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all
others in several important particu-
lars. The grinding millers are near
the center, requiring less power.
The plow-shaped grooves raise the
quicksilver with the pulp regularly,
with less power, without violence,
and with better amalgamating ef-
fect, besides admitting of a larger
charge. The inclined-shaped hous-
ings of the muller-plate openings
efficiently force the pulp directly
under the mullers.

It has been constantly running
for over eight months, and has
proved, in competition, to produce
a higher percentage of bullion,
with less power and with great
saving of quicksilver, over any
other pan in use. It is simple in
construction and operation, and
cheaper in first cost and economy
in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,

Where it can be examined and further particulars be learned; or persons may apply to the inventor and pat-
entee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long
been in constant operation. 16v20-1mr, 1amtf

THE WILSON

Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that this

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.
Or of **THE WILSON STEAM STAMP MILL CO.,** 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and consequently the best Steam Pump ever built. For sale by **BERRY & PLACE**, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, MARCH 18, 1871.

VOLUME XXII.
Number 11.

Improvement in Hubs and Axles.

Mr. C. R. Donner, of Sonora, has invented an improved wagon-axle, by means of which wheels can be made to last a long time without running loose, and by which the end motion can be taken up when it becomes too great. The construction will be easily understood from the accompanying illustration and description.

The hub, *A*, contains an axle-box, *B*, within which the axle turns. This box is provided with an oil-cup or opening, *C*, (one for small wagons, or two, as here shown, for large ones) and passages from this open at various points within the box so as to thoroughly lubricate the spindle, *E*. Within the box, *B*, near each end, are two steel supplementary boxes, *a, a*, which the spindle bears in as it turns, and which

are also pierced with holes for lubricating.

The nut, *F*, which serves to retain the wheel in place on the spindle, has a sleeve which extends inward and rests against the shoulder at the end of the spindle. The threads of the screw, *c*, are cut only in the outer part of the nut, the shoulder not being provided with threads, so that when the parts wear and allow too much end motion, the end of the sleeve, *F*, can be filed off, allowing the nut to be turned up closer, thus compensating for the wear. An oil-cup, *d*, may also be provided for the nut.

The cover, *G*, on the inner end of the wheel, protects the moving parts from dirt; and the cap, *H*, at the outer end, fits over the nut, *F*, being secured with lugs and a spring catch. The spindle may be made of steel and is drawn out to a wedge-shape, as shown at *I*, and has a double collar, as at *K*. The iron portion of the axle, *J*, clasps this wedge and is welded so as to extend under the collar, making a strong joint which requires very little labor on the part of the blacksmith.

A patent for this useful invention was granted last month, through the SCIENTIFIC PRESS Patent Agency, to Mr. Carlos R. Donner, of Sonora, Tuolumne Co., who may be addressed for further information. The patentee stands ready to prove the value of his device from actual working, and more than this cannot be required.

DARIEN CANAL.—Commodore Selfridge is quite sanguine that he has found a practical route for the canal. From Atrato to the Cacarica, where ships can go, the distance is less than fifty miles. The watershed is not over 300 feet high, and its base, at a height of 170 feet (?) not over a mile and a half wide. The rock is soft and easily worked.

Ore-Concentrator.

Grass Valley is quite noted for the many useful mining inventions which it has produced. Most favorably situated with regard to mines, having an industrious and intelligent population, it has been able not only to do its own work but also to help on others by its practical inventive talent. A good specimen of what it can do, and has done, is given in the invention which is here illustrated. This relates to ore concentration, a matter which cannot but become more and more important as our country grows older.

The concentrator consists of a circular inclined table, *A*, which rests upon friction rollers, *C*, and is revolved by suitable gearing, *B*. The pulp is conveyed into a box or hopper, *D*, whence it passes upon the upper stationary table, *E*. On this table are arranged radiating wooden strips, which serve to distribute the pulp evenly over the whole surface of the lower revolving table, *A*. Into the hopper water can be introduced in any required amount to di-

THE RAWLINS & STEPHENS ORE CONCENTRATOR.

lute the pulp, and cause it to move freely.

As the pulp falls on the table, *A*, it is carried around under brushes, *F*, suspended, at proper points, from fixed arms by means of flexible straps, so as to evenly spread the pulp over the table surface, and by keeping it agitated, allow the gangue or tailings to be washed down into the circular trough, *H*, which is placed around the outside rim of the table.

The ore or metal settles, in virtue of its specific gravity, upon the table and is carried around until it comes to a scraper, *G*, which is hinged to a stationary arm and rests upon the surface of the table in such a way as to collect the valuable material in a ridge, while a stream of water from the pipe, *L*, washes it off into the trough, *I*, whence it may be conveyed to any desirable point.

It will thus be seen that the table works continuously and requires but little attention. One person can attend to a number of tables, about all that is necessary being to have a general oversight in order to regulate the amount of water as may be required. The construction of the table is simple and but little power is required to move them; the expense of putting them up and running them is consequently small, and will be paid with heavy interest in the saving which they effect.

We have no precise data with regard to the operations of the tables, which, we are told, will work as much as 30 tons daily. They have been in use at Grass Valley and at the Meadow Valley company's mill at

Pioche City, Nevada, where they have given excellent satisfaction, with both silver and gold ores.

A patent was obtained, in July, 1869, for the United States, and subsequently one was taken out in England, through the SCIENTIFIC PRESS Patent Agency, by the inventors, Messrs. Rawlins and Stephens, of Grass Valley. Mr. C. C. Perkins has obtained an interest in the patent right, and parties desiring further information may address him at Hamilton, Nevada, or may apply to Barnum W. Field, Pioche City, Nevada. Patterns for the castings may be found at the Union Foundry in this city.

A Proof-Galley Rack.

We illustrate below a simple device which, we believe, will be found exceedingly useful to the compositor. This is a proof-galley rack, which is adjustable to any case, without the slightest trouble and which is shown in the engraving attached to a case, and with a galley placed

upon it. (One end of the galley is broken in the cut, to show the construction better).

When a printer corrects his proof, he is now obliged to place the galley on the case, thereby covering up a number of the boxes, and thus interfering materially with his work. With this device no boxes are covered, the case is not wet, and a

really considerable amount of time is saved.

This device is the invention of a practical printer, who ought to know what will be of use. The patentee is Mr. H. H. Gale, one of the publishers of the Roseburg *Ensign*, a copy of which now before us, impresses us very favorably with regard to its merits. We recommend printers to try the galley-rack, addressing for particulars Gale & Brother, publishers *Ensign*, Douglas, Roseburg County, Oregon.

San Francisco Gold Diggings.

That San Francisco is built on gold, consists of gold, is no new idea. But the plan of digging over North Beach with pen-knives and washing the top sand in wash-bowls has not been tried for so long a time, that we feel justified in pronouncing the late discovery novel and unprecedented in the annals of barbarian history.

At the end of last week this city was startled with the news that pure gold was lying in untold amounts on the surface of the sand hill behind Selby's smelting works. There was a rush thither and an eager delving. Visions of sudden wealth were assisted by tales of wondrous success, and it is strange that there was not a greater exodus from the business streets. How painful were the pangs which undoubtedly seized Mr. Selby at having neglected the rich natural resources lying at his very door, we do not know; and what visions of an immensely increased home circulation may have flashed through the brains of the proprietors of the SCIENTIFIC PRESS, are equally unknown to the editors. They were only painfully aware that their duties prevented more than brief visits to the scene of operations.

Whether the gold was so fine that the winds wafted it from the hands of the busy seekers, or whether the climatic conditions were unfavorable to a stay, we do not pretend to say. At our last visit, on Thursday, however, only nine persons were at work. One pan, one pail, a piece of tin, three pen-knives, three sticks and one flat stone, were all the implements then used by the gold seekers, who seemed weary of their toil, but yet worked on, sitting, lying flat on their stomachs, or assuming the position taken by the pupils of Socrates (according to an ancient writer) when studying astronomy.

We have brought home, in our shoes, large samples which have been subjected to the most scientific processes capable of being performed in a wash-bowl. We are not quite prepared to give the exact results as yet. A sudden change in the editorial staff of the Press may be looked on by our readers as an indication that "something's up." Otherwise, we advise them to refrain from investing heavily in the San Francisco placers.

COAL FORMATION.—C. Widemann writes to the *Jour. of Applied Chemistry* that, in France, in taking down a saw mill where a vertical saw had worked between two solid oak boards for fifteen years, the wood was found changed into coal, possessing brilliant scales and sharp edges. The appearance of the oak grain was only visible by the aid of a powerful microscope, assuming the appearance of very thin layers. It had been noticed that, when the attendant had neglected to oil the saw, the sheet iron became so warm as to come to the blue color (about 300° C.), the heat of the wood at the same time being about half as much. This occurred not oftener than once a month. It was expected to find charred wood, but not coal.

MECHANICAL PROGRESS.

STEAM DREDGING MACHINERY.—The following is a description, from an exchange, of the dredges now hulling in Chicago, for use in the cutting of a ship canal six miles long and 160 feet wide, from New Orleans to Lake Borgne, thence communicating with the Gulf of Mexico: "On a strong frame of oak and iron are secured two 52 horse-power engines. These handle a dipper weighing two tons, with a beam or handle long enough and strong enough to operate in water 25 feet deep. There are four of these frames, each with its two engines, and its dipper. Each with its appliances, weighs 40 tons. These require the use of two strong hoats, sufficiently capacious to sustain two of these machines, with the fuel, etc., requisite to keep the machinery in operation. The machinery of these boats is the same, with a single exception, that is, in the construction of the dippers. Those of the pioneer hoat are armed with cutters, teeth and hooks of steel. The ponderous dipper is thrust against the bottom by means of one part of the machinery, and then raised by another. The cutters, teeth, and hooks cut and tear up roots and timber, and deposit them beyond the banks of the canal. Both dippers are operated at the same time, and thus they excavate, as they advance, the full width of the canal, depositing trees, roots, rocks, and earth beyond its banks. The second hoat has plain dippers of the best construction for the removal of earth and mud. It is presumed that the first or pioneer machinery has cleared the canal of all formidable obstacles. The work of the second is to deepen and finish the channel ready for the passage of steamers of every size and kind, or even of national ships of the largest class. The dredges will operate in water from two feet deep to any depth necessary to float a ship. They will cut through and remove everything—roots, earth, and boulders weighing tons. Nothing but a solid ledge of rock can stop them. The cost of the dredges is \$44,000."

JOLIET ROLLING MILLS.—The Chicago *Railway Review* says of the new works in Joliet, Illinois,—at the center of the entire railway system of the East, West, and South: "The mills began running about four months ago; and it speaks well for the character of the enterprise that, during a very dull manufacturing season, in which many mills have been compelled to temporarily cease running, the orders upon it have necessitated the working of the force of 350 men one turn a day. The capacity of the mill is 250,000 tons of rails per year. Rails of any size or pattern are made. The Chicago Iron Co's furnace, from which the pig is obtained, have a capacity of 400 tons per week. The company have nearly perfected plans for Bessemer steel works on their grounds at Joliet. It is expected to begin building in the spring, and to have the work in operation in the fall, at a cost of from \$200,000 to \$300,000."

BALANCED SLIDE VALVE FOR LOCOMOTIVES.—A paper was read before the London Institution of Mechanical Engineers, by Mr. Wm. Beattie, at a recent meeting, giving a description of a new valve as follows: "This slide-valve is similar in shape to the old D valve, being made cylindrical at the back, and working inside a jacket of corresponding form fixed in the steam-chest; the steam pressure is excluded from the back of the valve by two steam-tight packing rings, one at each end, which are fitted into grooves in the body of the valve, and are pressed outwards against the jacket by means of spiral springs. The valve is thus relieved of the heavy pressure of steam, which in ordinary slide valves forces the valve against the cylinder face with a pressure that amounts in large engines to as much as nine or ten tons. The result has been found by experiment to be that the balanced slide-valves, which are made of cast iron, require only about one-third of the power to move them that is necessary with the ordinary unbalanced valves made of brass. The excessive wear and tear, to which the ordinary valves and the link-motion working them are subjected, is thus avoided; there is also an important advantage in the facility with which the engine can be reversed with steam on. The economy of fuel, consequent upon the saving in the power required, has been found by experience to amount to 2½ pounds of coal per mile run."

THE NEW RANSOME STONE.—Of this *Engineering* says: "Mr. Ransome makes a mixture of sand, Portland cement, ground carbonate of lime, and some silica readily soluble in caustic soda at ordinary temperatures, and these materials he makes into a plastic mass by the addition of silicate of soda. The mass thus formed remains plastic a sufficient length of time to allow of its being rammed readily into moulds of any desired form; but it gradually hardens, and ultimately becomes thoroughly indurated and converted, without any further treatment, into a hard stone capable of resisting heat and cold, perfectly impermeable to moisture, and which, as far as can be judged from the experience hitherto obtained, goes on increasing in hardness, and bids fair to be thoroughly durable. * * * By his new process Mr. Ransome is enabled to produce admirable artificial marbles, while by introducing amongst the materials fragments of quartz and a small proportion of oxide of iron, he obtains a stone of rich color, hardly distinguishable from Peterhead granite. Like the natural granites and marbles, the artificial substitutes are capable of taking an excellent polish, while they possess the great advantage over the natural products of being capable of being molded in the course of manufacture into any form at a trifling cost. It would be idle for us to attempt here to enumerate the uses to which the new stone can be applied, for they are practically numberless. For decorative purposes it will be invaluable, and Mr. Ransome deserves the best thanks of architects, and we may add of engineers."

FIBROUS VS. GRANULAR IRON.—The following is an extract from a paper recently read before the American Society of Civil Engineers, by J. Dutton Steele: "Some years since, an experiment was made under my observation bearing upon this point: Rails made of fibrous and granular iron were laid alternately upon a heavy freight-bearing road; at the end of six months, the fibrous heads showed the most marks of wear; at the end of twelve months, the granular heads began to break up; and the result was that the soft, fibrous rail wore out two of the granular. In the early railroad experience, a patent was taken out in England for making the heads of rails of granular iron, and at least two patents have since been taken out in this country for the same object, but all with the same result—all have passed into oblivion under the test of practice. There are several problems in the wear of rails which may be worthy of note. We all remember what a run the double-headed rail had in England, and how signal has been its failure; the first head subjected to the action of the wheels became granulated, and its tensile strength destroyed, so that when the rails were inverted they broke. True to the same principle, we find that any cause which changes the position of rails in the tracks, so as to alter the bearing of the wheels upon them, causes their destruction. If they are reversed side for side to the flanges, they wear out quickly, and even if they are taken up from one point in the road and laid down in another, by which means the bearing of the wheels upon them is, of necessity, more or less changed, the granulated surface is broken up, and their durability is decreased."

TRANSFER OF CARS FROM ONE GAUGE TO ANOTHER.—A correspondent writes thus to *Van Nostrand's Engineering Magazine*: "All, or nearly all freight cars have a stout timber or plank crossing under the body of the car, over the center of each truck, and projecting an inch or two beyond each side of the car, thus forming four points upon which a loaded car may rest without injury, independent of the trucks. Upon these same planks are placed three castings, namely the pivot and two side bearings. What I propose is, to have a lifting apparatus, with most of its working parts in a pit under the track, to lift a loaded car bodily off the trucks by the four points above mentioned, run out the trucks of one gauge, and run in trucks of another gauge, and let the car down upon them. The pivots, side bearings, and brake chains would have to be of uniform pattern; but in other respects all the existing variety of cars and trucks could be used, and every road would keep its *running gear upon its own road*. A 10-horse engine would furnish power to transfer several hundred cars in a day, with switch engines to move them."

A HAND SEWING MACHINE.—We see described a little lock-stitch sewing machine, to be held in one hand, and worked like a pair of scissors, making a stitch for each stroke.

SCIENTIFIC PROGRESS.

INFLUENCE OF THE SOLAR HEAT ON THE EARTH'S ROTATION.—Capt. John Ericsson has an article on this subject in *Engineering* for Feb. 10th, in which he disputes the heretofore accepted theory of Laplace, that the axial rotation of the earth is not affected by atmospheric currents and similar motions caused by solar heat, since their final result is the balancing and counteracting of each other. We have not space for his demonstration, but we quote a paragraph to show what he proposes to demonstrate:—"There are two classes of force produced by solar heat, capable of retarding the axial rotation, differing, however, entirely as regards ultimate results. The first class includes animate exertion, mechanical force produced by heat developed by the combustion of organic substances, and the resistance of abraded solid matter transferred from its original position by the waters of rivers flowing towards the equator. The forces thus enumerated, it will be shown, retard the rotary velocity of the globe in all cases when they remove weight to a greater distance from the axis of rotation, i. e., expand the circle of gyration, thereby diminishing the number of revolutions performed in a given time. Obviously the vis viva of the rotating mass will remain undiminished, as the center of gyration is merely removed to a greater distance from the axis of rotation. Accordingly, the axial rotation, though checked can never be stopped by the class of retarding influences thus pointed out. The second class, however, which comprises the retardation produced by the atmospheric air during its course from the polar to the equatorial regions; and the retardation caused by the waters which flow towards the equator to restore the quantity lost by the powerful evaporation within the tropics, not only diminishes the rotary velocity hut, at the same time, deprives the earth of so great an amount of vis viva, that the axial rotation must ultimately cease, unless some exterior compensating force exists, a supposition at variance with the principles of mechanics."

PETROGRAPHY.—Arch. Geikie, in reviewing a new contribution to German petrographical literature, by Dr. F. Senft, remarks that the study of rock-species has in England been allowed to fall into disuse, although the most important step in modern petrography there originated, viz., the application of the microscope to it by Mr. Sorby. In Germany, however, it is cultivated with assiduity. We quote: "The great paper of Mr. Sorby, published here thirteen years ago, has done much to quicken this research by showing that the older methods were in many respects untrustworthy. These methods were based primarily upon chemical analysis. But such analysis, while it reveals the ultimate chemical constitution of the rock, may not explain its mineralogical composition. The various stages of the metamorphism of the component minerals are thereby often lost sight of. Hence two rocks, having by analysis approximately the same chemical composition, may differ materially from each other in mineralogical composition. It is here that, as Sorby showed, the microscope comes in to our aid, and shows what the different mineral ingredients of the rock are, how far they have respectively undergone alteration, how they are built into each other so as to form the rock mass, and under what conditions they may originally have been formed. This important addition to the methods of research has so powerfully affected petrography, that this branch of science must be regarded as at present in a transition state. Many of the groups of rocks in the nomenclature now in vogue in Germany will require reconsideration. More especially is revision needed in those based upon subdivisions of the triclinic feldspars. Petrographers are now coming to see that, in a vast number of cases, it is not possible to discriminate the particular species of feldspar in a rock, further than as belonging to the orthoclase or plagioclase division. In this separation the microscope becomes of essential importance."

NEW METHOD OF FINDING THE RESISTANCE OF A GALVANOMETER COIL.—Sir W. Thomson recently read before the Royal Society a paper entitled "A modification of Wheatstone's bridge to find the resistance of a galvanometer coil from a single deflection of its own needle." We quote from it as reported in *Nature*, Feb 2d: "In any useful arrangement in which a galvanometer and a galvanic element or battery are connected through whatever trains or network of conductors, let the galvanometer and battery be interchanged. Another arrangement is obtained which will probably be useful for a very different, although reciprocally related, object. Hence, as soon as I learned from Mr. Mance his admirable method of measuring the internal resistance of a galvanic element (that described in the first of his two preceding papers), it occurred to me that the reciprocal arrangement would afford a means of finding the resistance of a galvanometer coil, from a single deflection of its own needle by a galvanic element of unknown resistance. The resulting method proves to be of such extreme simplicity that it would be incredible that it had not occurred to anyone before, were it not that I fail to find any trace of it published in books or papers, and that personal inquiries of the best informed electricians of this country have shown that in this country at least it is a novelty. It consists simply in making the galvanometer coil one of the four conductors of a Wheatstone's bridge, and adjusting, as usual, to get the zero of current when the bridge contact is made; with only this change of plans, that the test of zero is not by a galvanometer in the bridge itself showing no deflection; but by the galvanometer, the resistance of whose coil is to be measured, showing an unchanged deflection."

REPORT ON THE WASHOE REGION.—In a notice of the 3rd volume of the Report of the Fortieth Parallel Geological Exploration, *Silliman's Journal* for March says:—"It is not too much to say that the descriptions of the Washoe region, and the illustrative maps showing the geology and topography of the Comstock lode by Messrs. King and Gardner, with the maps, sections and elevations of the different parts of the mines and workings, surpass in completeness and perfection of execution, any similar work ever published. The chapters by Mr. James D. Hague on the methods of exploitation and treatment of the ores of the different districts give, in a masterly manner, the facts and details on these points, and also contain a large amount of carefully collated statistics, never before published, regarding the cost of production, and the yield of the mines up to 1870. Mr. Hague's practical experience in mining, and his thorough knowledge of the scientific principles involved, together with his candid and discriminating treatment of the facts under consideration, give great weight to his conclusions, and render this volume the most valuable contribution yet made to the literature of the Mining Industry of the United States."

WYOMING FOSSILS.—Prof. O. C. Marsh gives in *Silliman's Journal* for March an outline of one of the expeditions made by the Yale Scientific party during the past season. Of the region about the "Grizzly Buttes," on the route from Fort Bridger to the Green River, a region resembling the "Mauvaises Terres," of Nebraska and Dakota, he says:—"A careful examination of this 'Bad Land' district soon indicated that a fossil, vertebrate fauna of peculiar interest was here entombed; one apparently older and quite distinct from that preserved in the great Miocene lake-basin east of the Rocky Mountains, which we had recently explored. In the latter deposit, the remains of ruminating mammals were especially numerous, while the entire absence of fishes, and of reptiles, with the exception of a single species of tortoise, was a well marked feature. Here, however, reptilian life had evidently been abundant, and was represented by all its principal forms. Crocodilians, tortoises, lizards, serpents and fishes had swarmed in the waters of this tropical lake; while Tapiroid mammals, with many smaller quadrupeds, had lived near its borders. Their remains had long been weathering out of the "Grizzly Buttes," which offered so inviting a field, that we devoted a fortnight to their exploration, and were rewarded by the discovery of a large number of extinct vertebrates new to science, which will be described by the writer at an early day."

CORRESPONDENCE.

Notes of Travel in Calaveras County.

[Written for the Press.]

Murphy's Camp and Vicinity.

One of the most important institutions of a mining section is its water privileges. The Union Water Company, office situated at Murphy's, is presided over by Mr. J. C. Scribner, of Angels, and Alonzo Rhodes, of Murphy's, is Secretary. They have two main canals, or ditches, receiving their supply of water from the north and middle forks of the Stanislaus river, about 50 miles above Murphy's. The aggregate length of the two ditches is 60 miles. They originally cost over \$250,000; their receipts for the sale of water for mining and agricultural purposes average from \$30,000 to \$40,000 per annum.

Washington District Quartz Mines.

The Ferguson & Wallace claim, $6\frac{1}{2}$ miles north from Murphy's, is owned by the two gentlemen after whom it is named. They own 1,400 feet of a ledge, from 8 to 20 inches wide. They are running two adartras by water-power, working 5 men. Their rock thus far has averaged from \$34 to \$44 per ton. They have just completed a drainage tunnel, 236 feet in length, at a cost of from \$10 to \$40 per foot. The rock is hoisted by a whim, run by horse-power, through a shaft 94 feet deep. The Mountain Quail claim, $2\frac{1}{2}$ miles from the above, is owned by Mr. Samuel Woods. He has 1,100 feet of a 20-inch vein, which is much broken. It has, I am informed, never paid less than \$75 per ton. He is running two adartras by water-power, employing 3 men, working through a shaft by a windlass.

One mile from the above, a San Francisco company are now engaged working three different ledges, known as the South Bank, Enchantress, and Oro Mita. On the latter a shaft has been sunk 130 feet, one 110 feet deep has been sunk on the Enchantress. On the South Bank, a shaft 12 feet deep, reveals a well-defined ledge, 8 feet thick. The few tons of rock crushed from the above named ledges, have averaged from \$20 per ton up in the thousands, for small lots. Neiswander, Jaquith, Parsons and others are the lucky proprietors.

Texas—Union—Angels.

The Texas claim, two miles below Murphy's, is a deep diggings, ancient river claim, owned by Thomas Cox, John and Joseph Manuel, Ira Thomas and Richard Evans. They work through a shaft 150 feet deep, employing 10 men regularly, (at times 20). It pays them a fair remuneration, and has for years back.

The Union Quartz (better known as the Stickle's) mine, is situated in the suburbs of Angel's Camp, 6 miles below Murphy's. It is owned by Geo. Stickle & Co. (7 others), who have 400 feet of a ledge from 16 to 25 feet thick. The mine is worked through a vertical shaft, 240 feet deep. They are running a 10-stamp mill by water-power, crushing daily from 8 to 10 tons of rock (running nights only). Their rock will average about \$8 per ton; it is highly sulphuretted, and the sulphurets are quite rich; but they have no way of working them up just now. Ten men are regularly employed on this claim.

The Angels quartz mine, near Angels, is owned by a joint stock company, principally a San Francisco. H. B. Potter is Superintendent. This company claim 900 feet of a ledge averaging 14 feet in width, but varying from 6 to 30 feet. They have two shafts down on the lead, 100 feet apart, on an incline of 70 degrees. The principal one is 400 feet deep. They have a very complete mill of 30 stamps run by an 80-horse power engine, and hoisting works with an engine of 25-horse power. They are crushing daily (24 hours) 45 tons of rock, which averages about \$8 per ton, and reducing about two tons of sulphurets daily, which average \$75 per ton. The water in the mine is raised by two of Blake's steam pumps, one situated on the 200-foot and the other on the 400-foot level. They regularly employ 60 men. A novel device for an amalgamator, invented by Dr. Hill, of this place, is in use here, (caveat filed upon the same.) The peculiarity of the device is, that it rotates and the millers are stationary.

Several Skulls

Of human beings at different times have been unearthed in this county, at a depth that has puzzled some of your geologists to tell in what age they lived, moved and had their being. So I have obtained a

diagram of the shaft, together with a photograph of the skull that was taken out of a shaft near Altaville, some few years since, at a depth of 132 feet, in a bed of pay gravel, beneath seven other stratas. Small particles of gold were found in the skull, and petrified wood of different kinds near the same.

[We give the cuts exactly as we have received them. Any comments are in order.—Eds.]

Altaville is situated some two miles from Angels in the direction of San Andreas—once a very thriving village. D. D. Demorest, at this place, is driving a very fine business in the line of a machine shop and foundry.

Thorp's—Indian Ravine.

Thorp's mine, three-quarters of a mile from 4th Crossing and about five miles from San Andreas, is just coming into notice. It is owned by Capt. M. Thorp & Sons, who claim 1,000 feet of a ledge that

averages four feet in width, (i. e. the principal vein.) It has three spurs, possibly three different veins. They have an incline shaft down on the ledge 65 feet deep, on an angle of 45 degrees. With three adartras and two stamps they have been crushing about five or six tons per day. They have just completed a five-stamp mill, and now expect to crush eight tons daily. Their rock averages about \$6 per ton, running as high as \$10. As it has heretofore paid them fair wages, and now looks better, the probability is that some good report will be heralded from this mine ere long.

The Indian Ravine Tunnel Claim,

One mile south-west of Chili Gulch, is owned by J. T. Carr, of San Francisco. A. W. Holbrook is Superintendent. Now 25 men are working night and day. This is a blue gravel deep channel claim, 1,200 feet in length, worked through a tunnel 2,800 feet long. The pay gravel is about 60 feet wide and 6 feet deep. It is brought by car to the dump, at the mouth of the tunnel, and washed by hydraulic process. The pay averages about \$1 per car load, and 150 car loads are taken out daily (24 hours). The tunnel cost \$28,000 to construct. Air is forced into this tunnel by a fall of water arranged at the mouth of the same, 70 feet high, falling through a pipe into a tub, with another tub (inverted) of less diameter over the same, so arranged as to let the water escape but not the air. From this upper tube the air is conducted into the tunnel by a pipe. Simple but very complete.

Gwin—Alexander.

The Gwin mine is situated 5 miles south-west of Mokelumne Hill on lower rich gulch, on the Hayward lead. Gwin & Coleman are proprietors. Wm. M. Gwin is Superintendent. This claim is 2,800 feet long and averages 10 feet thick. They are working through a shaft 400 feet deep on an incline of about 60°, employing 50 men, running two mills, one of 20, and the other 16 stamps. Only 93 inches of water are required to run both mills. It is ac-

complished by conducting the water to a 7-foot hurdy gurdy wheel at each mill, through an hydraulic pipe under a 280-foot pressure. They crush daily (24 hours) 65 tons of rock, that averages them \$9 per ton.

The Alexandria mine, next adjoining below, is owned by J. H. Alexander & Co. They own 1,000 feet of a similar ledge, that averages 10 feet in width, are working 12 men, and running a 10-stamp mill, using only 18 inches of water to run a similar wheel as that mentioned at the Gwin mine, but under a 840-foot pressure. They have a shaft down 200 feet, and crush daily about 12 tons of rock that averages from \$7 per ton upwards. L. P. MC.

[To be Continued.]

The Largest Safe-Manufactory.

[Written for the Press.]

EDS. PRESS.—In wandering about the Eastern realms, I have struck what I believe, is the largest safe-manufactory in the world. This is Hall's Safe and Lock Manufacturing company's works, in Cincinnati, Ohio, where 500 men are employed, and where goods to the aggregate value of \$5,000,000 are turned out annually. A visit to these works will amply repay any one. They have, moreover, branch houses in Chicago, St. Louis, Louisville, Cleveland and New Orleans, and agencies in all the principal cities in the Union. At no distant day, they will probably come out to your coast.

Having heard some pretty strong, what I was at first inclined to think too strong, expressions in praise of their manufactures and of the amount of their business, I hunted them up. I find that they have what I am inclined to think the best safe I have yet examined, one that will prove a decidedly tough nut for any burglar, or for any conflagration. And in regard to their business, although having so extensive works, they are still making enlargements in order to be able to fill their orders.

Mr. Joseph L. Hall is the head of the concern—a gentleman of the greatest practical experience and the highest inventive talent. He has taken out a number of patents and has been unusually successful, and the facts given in favor of his safes and lock are most stubbornly favorable.

Three general classes are made: "fire-proof" safes, for the protection of books and valuable papers from fire; "burglar-proof", constructed entirely of iron and steel, not fire-proof, but intended to be placed in fire-proof vaults for the protection of money and valuables; and "fire and burglar-proof" safes, a combination affording protection against both fire and burglars, in which the burglar part or box is placed within the fire-proof safe.

In the construction of fire-proof safes they use a most superior article, Hall's Patent Concrete, which is said to be a perfect non-conductor, yet free from dampness; which becomes very hard, after being put in place, so as to be difficult to be cut with even a cold-chisel and hammer; and which adds to the strength of the safe. There are over 50,000 of these concrete safes in use in the U. S., and not a single case of failure, I am assured, has ever been recorded.

The burglar-proof safes are constructed on Mr. Hall's dove-tail and tenon and groove principle, which has been proved successful in resisting the most experienced burglar and the best instruments in all attempts to wedge open the doors and safes. These dovetails fit perfectly into each other, and the more the wedge is driven the tighter they become; they are, in fact, a number of wedges resisting the wedge and jack-screw of the burglar, and until their power and tension are exhausted, his implements can have no effect. They are the only party in the United States making this character of safe, and they claim, in this respect, a great and decided superiority over all other burglar-proof safes manufactured.

The lock is another great success, which may be said to be actually impossible to pick. On the lock of six tumblers, over eight hundred billions of changes can be made (so I am told, I haven't calculated them), and on the largest or 12-tumbler lock, an almost infinite number. To try all the combinations of the smallest lock would take a smart man, working night and day, thirty years. Yet a child can operate it with the correct combination.

My letter is pretty long for a description of one factory, but the subject is important and worthy of the attention. I advise you to get a Hall safe. w. n. m.

Using the Microscope.

A correspondent, P. H. H., of Oakland, writes us that he has a microscope, the use of which he does not understand, and requests information on the subject. We handed the letter to Mr. Henry G. Hanks, a leading member of the Microscopical Society. Mr. Hanks may be found at 649 Clay street (the last sentence of his letter requires, perhaps, this statement), where he has a most interesting collection of minerals, fossils, etc., which he kindly allows any one to examine.

EDS. PRESS.—The information your correspondent wishes to obtain cannot be given in a few words. Books with details of microscopic manipulation consist of hundreds of pages. The best works on the subject are: Beale's "How to work with the Microscope;" "The Microscope and its Revelations," by Carpenter; a work by Hogg, with 500 illustrations; also Queckett's "Practical Treatise on the use of the Microscope." These works and many others upon the same subject may be bought at the principal book stores, or examined at the libraries.

A few general directions may be of assistance to him. There are two classes of objects for microscopic observation, one transparent and the other opaque. Each requires a different mode of treatment. It is essential that the former shall be naturally transparent, or that it be made so by being rendered extremely thin so that transmitted light can pass through it. Granite, limestone, fossil wood and even gold may be so examined, if in sufficiently thin sections.

It is sometimes necessary to float the sections in a fluid, to assist in rendering them transparent, such as water, oil, glycerine, or spirits of turpentine, as the case may require.

An illustration of each method of treatment will be the clearest explanation. Suppose the object to be examined to be the wing of a common house fly. It is only necessary to lay it flat on a slip of glass and place it on the stage of the microscope, and so arrange the reflecting mirror beneath that the light is thrown up through the object, causing the field of the instrument to appear sharply illuminated, when seen by looking down through the instrument from above. The focus is then adjusted, and the object will be seen in greater or less perfection according to the perfection of the glasses used. It is customary to use the lowest object glasses first, and then to increase the magnifying power to the extent required.

To examine opaque objects, the reflecting mirror is turned aside, or the diaphragm plate so arranged as to intercept any light that could pass up from below. The light from a good lamp, or from an aperture cut in the window blind, is concentrated upon the object so as to illuminate it strongly. It is then examined as in the first case, always using the lowest powers first. The use of the more refined and improved appliances for illumination would require too long a description for the limited space that you could afford to give in your valuable paper. If your correspondent would call upon me, I could show him in a few minutes what would require pages of your paper to describe; and I would take pleasure in so doing.

A REMARKABLE SPRING.—A correspondent sends to the *Journal of Chemistry* the following account of a remarkable spring in Texas:—

"About sixty miles north of Galena, near the town of Liberty, there is a spring, the water of which is quite acid, simulating lemonade, and those who taste it like it so much that they drink it almost immoderately. When you feel hot it is quite delicious; and under any circumstances, whether hot or cold, the drinking of it produces perspiration, with no unpleasant effects afterward. The spring has no apparent outlet or inlet. It is probably sixty feet across it, and it is covered with a white froth or foam, which on close examination appears like cream tartar on a wine-cask. It kills insects, worms, and other small animals that come near and use it. No fish or other evidence of life is seen within its waters."

DOG POWER.—In Philadelphia there is a small blacksmith's shop, the bellows of which is operated by dogs. The bellows are connected with a wooden wheel box, which is kept revolving by the motion of the dog, something after the manner of a treadmill.—*Iron Age*.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ENCOURAGING.—*Chronicle*, March 4th: A few days since a spur of fair-looking ore, six inches in width, was cut by the tunnel of the Mt. Bullion Co. It is to be hoped that the great Wellington ledge will soon be reached. If this shows good ore in sufficient quantities, the company will erect a mill without delay, and we have reasons for believing that the Schenectady Co. will erect their mill at the same place. The latter company has struck another deposit of rich ore in their Tarshish claim.

HOPE VALLEY.—In this valley the snow is 4½ feet deep. The sole residents this winter are W. Willis and two others who have been working the Crystal Falls claim, on the Ewall ranch. They have sunk a shaft 30 feet, and when they get down 20 feet further they will drift.

GLOBE.—*Miner*, March 4th: The mill has, during the week, been pretty thoroughly tested, and is pronounced a success. The crushers were fed yesterday up to 24 tons a day, and performed well. Ore has been struck in the south drift, which is being taken to the mill.

The *Miner* says the Schenectady has payed enough in sight to keep a 40-stamp mill running for two years.

LUMBER to the amount of several hundred thousand feet and 30,000 bricks have been engaged this week for the Monitor & Northwestern mill.

BUTTE COUNTY.

STRUCK IT RICH.—*Oroville Record*, March 11th: A note informs us that the Spring Valley Mining Co. have struck very rich blue gravel, in the direction of the Blue Gravel Co.'s line, and running under the main table mountain. Everybody feels greatly encouraged.

CHEROKEE CO.—It is stated that this Co. have perfected arrangements for the iron pipe to carry the waters of Butte creek on their claims. The work will be prosecuted to completion during the summer.

CALAVERAS COUNTY.

WHAT CHEER.—*Chronicle*, March 11th: The machinery for pumping and hoisting will be erected at the mine next week. The machinery is on the ground and timber being hauled.

KERN COUNTY.

A *Bulletin* correspondent writes, March 4th, that the Stoddard pump on the Joe Walker mine has been running eight months and has been repacked only six times,—taking 30 minutes each time. The ledge is well developed for a depth of 300 feet, the average width being 9 feet. Test crushings of 100 tons and over have been made thus far—taken from the ledge promiscuously, without any selection, and have yielded \$20 per ton. The cost of mining and milling is \$6 per ton. At the present time 60 men are employed.

MARIPOSA COUNTY.

The *Gazette* of March 10th says that Messrs. Stevens & Lamber have commenced work on the old Whitlock quartz mine. Some 10 or 12 miners were set to work Monday.

NEVADA COUNTY.

NEVADA MINE.—*Gazette*, March 7th: The owners have leased the property to S. Johnson for a term of years. Mr. J. is a practical miner, and will immediately commence repairing and developing the mine. The 12-stamp mill has recently been overhauled and repaired.

COMPLETED.—Same of 9th: The tunnel of Gentry & Co. at Wet Hill, is completed, and is 1,100 feet in length. The company commenced sluicing gravel through it today, using 300 inches of water.

IN LUCK.—Same of 10th: The North Bloomfield Co. are running drifts in their claims to ascertain the course of the bed-rock. They are working 80 men, and are taking out \$1,000 per day. This is only prospecting work.

RICH PAY.—On Relief Hill there are four mines at work. The Wolkenshan Co. in consequence of a scarcity of water, have begun drifting, with the best of results. They have been at work two months, and are taking out \$30 per day to the man. The Eagle is at work with similar results. There are at least 50 men at work on the hill.

EUREKA MINE.—*Grass Valley Union*, 8th: Yesterday was the regular melting day. The product of the mill for the 12 days including Saturday, was put into bars, value \$72,000.

REVIEW.—*Transcript*, March 10th: In Nevada township the Banner, Pittsburg, Orleans, Manhattan, Pennsylvania, and several other quartz ledges are being worked, and the Nevada Quartz Co. is fitting up after remaining unworked for more than three years. The Banner mine is yielding better than for a year, and some very rich rock has recently been worked. The Pittsburg is paying regular dividends and the Pennsylvania is yielding good returns. The Orleans and Manhattan companies have good looking ledges, and are being rapidly developed. Gravel mining is encouraging. The Cement Hill Co. is washing with a good head of water. This is a new enterprise, and after the present run will make their first clean up. Gentry & Co., on Oustomah Hill, have their tunnel and flume completed, and have just received a large Craig's nozzle of the new style. In a day or two this company will commence washing on ground which it has taken over three years to open, and which prospects well. The Manzanita claims are being worked as in years past. Within the past month in the vicinity of Washington, and on Canon creek, a number of locations have been made. At Omega the miners are all at work. The Omega Co. is running two sets of diggings with large heads of water, and six or seven other companies are ready to start up. The miners at Diamond creek are busy, and the season promises to be lively. On Little York nearly all the companies are washing. The Little York Co. have the best water right in the State. In Bloomfield, Bridgeport and Enreka, the increase of work is in consequence of the additional supply of water in the ditches. At Grass Valley the prospecting in gravel still continues. Rough and Ready appears to be in a fair way to again become renowned as a place of rich mines. At Goshen Hill and Randolph Flat recent developments have been encouraging. At Meadow Lake little will be done until the snow is gone in May or June. During last season the prospect was encouraging, and when the snow melts prospecting will commence in earnest.

The *Transcript* of March 13th says Gentry & Co., of Cement Hill, have met with a hindrance. Owing to an insufficiency of water, their shaft and tunnel have filled with dirt. The tunnel is almost choked up for 300 feet. It will take a week to get ready again.

NORTH STAR.—*Grass Valley Union*, Mar. 14th: The mine declares a dividend which aggregates \$9,000, with a surplus for working or for accidents carried over.

RANDOLPH RIDGE.—McSorley & Co. are making a long run before cleaning up, and the gravel looks well. The Baltic is ready for a clean up, and we expect a good report. Webster & Co. are finding rich pieces of cement above the bed rock. The whole ridge on the Randolph, or Alta Hill, is proving rich.

PLACER COUNTY.

GREENE MINE.—*Herald*, March 11th: The owners have placed on the mine a small crusher, pans and other reduction works, and have made two small runs of the rock. They first reduced ten tons, which yielded \$500 or \$550 to the ton. Another small run of six tons and sixteen hundred pounds from a different class of ore was then put through, which turned out \$1255 in gold, or near \$200 per ton.

GOLD RUN.—*Cor. of Stars and Stripes*, March 9th: "We are having a fine warm rain. There is plenty of water for all the miners. It will be the best season for mining we have had for several years. We had about 18 inches of snow last week, but it has all gone."

RATTLESNAKE BAR.—*Cor. of same*: The water will be in the North Fork ditch in about three weeks.

DUTCH FLAT.—*Cor. of same*: The rain has been falling for three days, the ditches are full, and every body's face has shortened by some inches.

MICHIGAN BLUFF.—The Weske claim at Turkey Hill, paid for the first seven weeks of the year, over and above all expenses, as follows: Jan. 1st, \$752.50; Jan. 8th, \$510; Jan. 15th, \$711; Jan. 22d, \$500; Jan. 29th, \$904.50; Feb. 5th, \$900; Feb. 12th, \$900. Aggregate net yield for seven weeks, \$5,178, or at the rate of \$38,465 per annum. The claim embraces about 1,600 feet of the ridge between El Dorado and Volcano Cañon. A tunnel from the El Dorado Cañon side has been driven 1,700 feet; straight for the first 500 feet, and since that following a rich channel parallel for some distance with El Dorado Cañon, then diverging into the ridge at right angles, and apparently leading towards a main channel supposed to be perhaps a thousand feet farther in, and doubtless immensely rich.

PLUMAS COUNTY.

SAWPIIT FEAT.—*Quincy National*, March 4th: The New York Co. who for some months have been prospecting for the back channel, struck it a short time since. They have had no water to wash up, as yet, but from the gold picked up in the dirt, and the way it "pans," the channel is going to be very rich. The Golden Gate Co. has struck good prospects, and will take out considerable ore, when water comes. Two new companies have commenced operations. The Washington Hill Co. has been taking out good dirt for some time, working six or seven hands, and making ten dollars per day to the man. They worked for a long time in bed-rock, without getting "the color." The tunnels show a large body of rich pay ground, and the boys have a "dead shot" on a fortune. The French Co. adjoining, are also doing well.

ITEMS.—Mr. Hughes, of Meadow Valley, reports everything running smoothly. Crescent Mill has been shut down for the present. Concklin & Ray have purchased the boiler formerly used in the Bull Frog mill, and will put it in their mill at Argentine, as soon as it can be hauled over. The new diggings on the head of the South Fork, between Onion Valley and Gibsonville, will be opened during the summer.

SAN BERNARDINO COUNTY.

CLARKE.—*Guardian*, March 4th: A wagon load of ore came to town on Thursday from Clarke District, which for richness will compare with the best ore of the Pacific Coast. We understand this ore will be forwarded to London.

SAN DIEGO COUNTY.

THE STORM.—*Union*, March 2d: We learn that the storm of last week raged with fury for three days at the mines. The roads have been almost entirely washed away by the heavy rains. In consequence of the impossibility of getting quartz to the mills, operations will be suspended until the roads can be repaired.

SIERRA COUNTY.

FOREST CITY.—*Messenger*, March 11th: The Bald Mountain Co. whose tunnel was started last summer, are now in 650 feet; they unexpectedly struck hard bed rock, and are now making slow headway. They think 100 feet more will finish the hard rock. They have a splendid tunnel and sufficient ground to make all the owners independent. The North Fork Co. whose tunnel was started last September, is in 1,030 feet, the work of four men only. They are running for the main channel and expect to strike it in 2,000 feet, near where the Uncle Sam Co. left it several years ago. The American Co., Knapp & Wren, lower down on the channel, have ground which they are running to prospect. The "Shoo Fly" Co., formerly the Oregon, are working with prospects of ground sufficient to last years. The Young America Co. are still at work. Gregg and Wade, working down Oregon Creek on a small channel, have the dust to show for their labor. Shakeville claims at the old Galloway Ranch, continue to pay well, though there is no water to wash the dirt. The boys pan out enough to pay wages, and expect to get their dividends in the spring. Mr. Low took a piece of gold from his claim this week that weighed 6½ ounces. A company is being formed to open the channel that crosses Rock Creek, which is, without doubt, very rich. Miles and miles of these old channels lie unprospected in Sierra for the want of a little capital to operate with.

EAST FORK MINING CO.—*Democrat*, Mar. 9th: Mr. Earnest Kruse has purchased a controlling interest in the mine known as the "Wehe Ledge," and will put a force of men to work running a tunnel. After developing the ledge sufficiently, he proposes to erect a mill.

THE SHAMROCK.—The Shamrock Boys have again found good pay in their claims on Fir Cap Mountain. They have been working off their pay streak for some time, but have got it now as rich as ever.

SHASTA COUNTY.

IGO CITY.—*Cor. of Courier*, March 11th: The quartz mill of Butterfield & Co., on South Fork, commenced running Saturday. McPherson & Co., on the ridge west of Horsetown, have commenced a short distance from the bank of Clear Creek; the flume through which they run their tailings is four feet wide, three feet deep, and has a fall of four inches to twelve feet. Everything about their claim is on a mammoth scale. The main hydraulic pipe is 22 inches in diameter. At a point where the tunnel crosses the ridge, between Clear Creek and Dry Creek, the flume will be 300 feet below the surface. The total cost of the works contemplated cannot fall much short of \$100,000.

TRINITY COUNTY.

DUTTON CREEK.—Dixon, Hurst & Co. cleaned up their boxes below their hed-rock ditches after a week's run. We could not learn the proceeds. The smiling countenance of their Weaverville partner told us that he was satisfied. The diggings have paid \$15 to \$20 per day to the hand.

RED HILL.—Mr. Peter Weise, of Red Hill, came to town Saturday, bringing proceeds of first clean up. He has been working four weeks with little water, and cleaned up the head of his flume only. We learned enough to warrant us in saying that it amounted to between one hundred and forty and one hundred and fifty ounces.

JUNCTION CITY.—John Franklin is rolling the money out on Canon Creek. A. A. Simonds is doing well in his drift diggings and lately struck another pay streak. McKinney & Grover have started a tunnel to open a drifting claim that can be worked when water is too scarce for their sluicing claim. They are in 160 feet.

DOUGLAS CITY.—Plenty of water, and everybody at work. All the ditches full for the first time in two years. Some strangers who went to work on Trinity bench, have found a good prospect.

CANON CITY.—*Cor. of same*: B. Baumgartner and partner are being well paid for time and money invested in the purchase of the Garwood claim. The other day they picked up \$500, with a prospect for more of the same sort. R. Berkley and G. W. Todd have struck \$8 diggings below the Butler stand, and on the second bench. Water having been scarce longer than usual, it has given the miners time to prospect.

TUOLUMNE COUNTY.

GOOD PROSPECTS.—*Sonora Democrat*, March 11th: We learn that G. A. Treadwell has for some time been working in the Gravel Range not far from Garrote in what is known as the "Kanacka claim." Some time since work on this range was discontinued in consequence of difficulties about water and the litigation which ensued. The prospects are now that good mines will be found in the range; the first clean up made by Mr. Treadwell is reported as paying handsomely.

Nevada.

ESMERALDA.

STRIKE.—*Enterprise*, March 11th: A gentleman just in from Pine Grove states that a very rich vein of gold bearing quartz has been discovered ten miles east of that town. Choice pieces from the surface have yielded at the rate of \$10 to the pound. The lead is only three feet in width, but is well defined and can be traced a great distance.

EUREKA DISTRICT.

PHOENIX.—*Sentinel* March 11th: The main incline of the Adams & Farren is in a body of carbonate ores at a depth of 100 feet, and the Empire and Lexington are yielding large quantities of the richest ore. We have samples that cannot be excelled in this district. The Empire is a well defined vein three feet thick, worth \$100 to the ton in gold and silver. The Lexington is six feet thick, with ore about the same. Enough has been done on these mines to show that they are permanent and reliable. This company will probably erect reduction works soon.

RICHMOND FURNACE.—*Supt. Dunne* has a full number of mechanics at work on this new furnace and it will be ready to fire up in a few days. When this is completed there will be an addition of 7 to 9 tons to the billion yield of the district. We need 20 as good furnaces to use up the ores as fast as the miners are producing it.

HUMBOLDT.

OREANA.—*White Pine News*, March 8th: We learn that at Cottonwood Canyon, near Oreana, the mine owners are shipping considerable quantities of ore to San Francisco—realizing therefor an average of \$80 per ton—netting, above all expenses, \$40.

CENTRAL.—*Silver State*, March 11th: Shipments of ore continue from Mill City to the Anburn Mill in Reno. Mr. King has returns from a lot recently treated, which yielded \$175 per ton, and Clark another lot, showing \$130.50 per ton.

RYE PATCH.—*Cor. of same*: F. F. Oshiston, of the Anburn Mill, paid a visit for the purpose of examining the Alpha mine, and intends to resume work on it, as soon as he gets a survey made. Cody & Leyson have resumed operations on the Hard Cash. The Butte mill is shut down, for the purpose of putting in five more stamps—making ten—and making some improvements on the furnace, which has proven a decided success. Ore is being shipped here for reduction from Belmont, Golconda, and several other districts.

WASHOE.

KENTUCK.—Gold Hill News, March 11th: The hoisting works started yesterday. It will take two weeks to make repairs. There is considerable good ore in the section where the fire occurred.

DANEY.—The Co. have sunk a new shaft 200 feet, and are running a drift to reach a body of rich ore which they believe to exist at the bottom of the old works. The drift is in 100 feet.

HALE AND NORCROSS.—Enterprise, 12th: About 190 tons of ore daily extracted. On the lowest level the breasts yield the usual quantity. From the old mine 30 tons per day of moderate quality is produced. February dividend was \$5 per share.

SAYAGE.—The daily yield is 120 tons of ore. The two northernmost compartments of the shaft are being retimbered. The eighth and ninth levels are producing the usual ore. The south drift will soon be connected with the Hale & Norcross. About 25 tons is daily extracted from the old levels.

CHOLLAR-POTOSI.—During the past week there have been extracted 1,630 tons of ore. The average assays have been \$64.80. They yesterday shipped to San Francisco bullion \$31,500.

OPHIR.—Work is vigorously prosecuted in the up-rise from the south drift. No ore has yet been found, but the indications are good.

CROWN POINT.—The ore deposit in the 1,100-foot level still holds out. It has been followed 112 feet. It shows better than ever in the face.

SIERRA NEVADA.—This mine is yielding well and the mill is in constant operation. The Sacramento and Meredith mill is steady at work.

SUTRO TUNNEL.—The Tunnel was in 1,860 feet yesterday. The rock is hard but works tolerably well. A considerable flow of water is coming from the face.

IMPERIAL.—The Imperial main drift is 10 feet into the Holmes ground. They will commence cross-cutting in eight or ten days.

YELLOW JACKET.—There was a rumor yesterday that good ore had been encountered on the 1,100-foot level, north. The deposits in the 1,000-foot level north look well.

VIRGINIA CONSOLIDATED.—A cross-cut to the east has been made from the north drift without finding ore; a cross-cut will now be made to the west.

SEGREGATED BELCHER.—Work is going on as usual.

BELCHER.—This mine is yielding well in all the ore breasts. Considerable prospecting is being done.

BUCKEYE.—This mine, at Silver City, is yielding well. New hoisting machinery will soon be erected.

CALEDONIA.—The Co. are taking out 100 to 120 tons of ore per day, which is being crushed at the Sapphire and Piute mills.

GOULD AND CURRY.—This is yielding as usual, and a good deal of prospecting is being done in the old levels.

OVERMAN.—The Co. are taking out the usual ore.

NEW DIAGNOSIS.—The Carson Register of March 14th says that rich gold and silver quartz and placer mines have been discovered 32 miles south-east of that city, on the East Fork of the Carson. There is so far only one quartz ledge, but that is 100 feet wide and crops out 30 feet. It is traceable for half a mile. It is a few miles from the Mammoth ledge in Eagle District. The quartz is decomposed and a painful taken anywhere from the top of the ledge, will yield twenty to fifty colors of gold. Assays made at the United States Branch Mint show the quartz to carry \$106 to \$175 in silver to the ton. The first location, called the Oriental, was made by J. A. Blethen, E. B. and G. H. Hancock. The bed of the stream below the ledge yields gold-dust worth about \$16 per ounce.

WHITE PINE.

REVIEW.—News, March 11th: The mining interests of our district are looking brighter than ever, notwithstanding the weather. Not a mine of any prominence, that has been steadily worked, but what shows a marked improvement. In several leading mines the force has been increased, and in a few weeks there will be steady employment for some hundreds of miners. There is evidently a better feeling abroad regarding our district. The tramway is rapidly approaching completion. One half mile of the wire was stretched yesterday. It is expected to be in working order two weeks from to-day. The Big Smoky mill is never idle. Ores have been worked at this mill from some dozen different mines during the week, the pulp assays of which run all the way from \$50 to \$700 per ton. Several base metal mines started work during the week, and many more will start when the weather becomes settled.

ITEMS.—Ten more men put on Original Hidden Treasure, making 36 in all. Silver Wave east chamber is opened 40 feet through a solid mass of high grade ore. In running the Allen tunnel, several veins were cut, from four inches to two feet thick, and assaying \$50 to \$6,000 per ton. Pulp assay of Nevada ore is \$518. Do. of Empire State, \$686. Trench is taking out high grade ore. Vanderbilt has \$150-ore. Ward Beecher Consolidated, belonging to Gov. Blaisdel, has ore like that of the Ward Beecher. Oasis mill is turning out quantities of fine bullion from Ward Beecher ore. It is reported that the Maryland mine, in Pinto district, has been sold for \$300,000. Specimens assay as high as \$9,000 per ton.

LEA & PERRINS' WORCESTERSHIRE SAUCE.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' Sauce, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcester-shire Sauce, upon the wrapper and labels of which the names of Lea & Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper. Wholesale and for export to Proprietors, Worcester: Cross and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-3mins

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., March 16. The mining stock market has been active with some very heavy transactions during the last week, and considerable fluctuations in the prices. Last Friday, dividends were paid by the following companies:—Chollar-Potosi, \$140,000; Golden Chariot, \$70,000; Hale & Norcross, \$40,000; North Star, \$9,000; Yellow Jacket, \$48,000. The Chollar-Potosi paid an extra dividend yesterday. Amador has been quoted a couple of times at \$330.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

Price, Mar. 9. Highest, Lowest Mar. 16. Adv. Dec.

Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109, Post st.] SAN FRANCISCO, Thursday, March 16. SOLE LEATHER.—The demand is still equal to the supply, and prices firm.

CALF AND KIP SKINS.—The close of the war has made no difference in the price of French stock as yet, and probably will not. Domestic skins rule the same as heretofore.

Best French Calf Skins, 1/2 doz.	76 00 @ 100 57
Common French Calf Skins, 1/2 doz.	35 00 @ 75 00
French Kips, 1/2 lb.	1 00 @ 1 00
California Kip, 1/2 lb.	60 00 @ 75 30
California Calf, 1/2 lb.	1 00 @ 1 00
Eastern Wool Stuffed Calf, 1/2 lb.	80 @ 1 25
Eastern Bench Stuffed Calf, 1/2 lb.	1 10 @ 1 50
Eastern Calf for Backs, per lb.	1 15 @ 1 26
Sheep Roams for topping, all colors, 1/2 doz	8 50 @ 13 02
Sheep Roams for linings, 1/2 doz.	5 50 @ 10 07
California Russet Sheep Linings, 1/2 doz	1 75 @ 5 35
HARNESS LEATHER, 1/2 lb.	30 @ 30
Fair Bridle, 1/2 doz.	30 @ 30
Skirting, 1/2 side.	4 50 @ 4 50
Welt Leather, 1/2 doz.	30 00 @ 60 40
Buff Leather, 1/2 foot.	22 @ 50

San Francisco Metal Market.

PRICES FOR INVOICES

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

FRIDAY, March 17, 1871

IRON.—Duty: Pig, 51 1/2 ton: Railroad, 60 @ 100 lbs; Bar, 10 1/2 @ 11 1/2; Sheet, polished, 30 @ 35; common, 15 @ 20; 1/2 in. Plate, 31 1/2; Pipe, 15 @ 17; Galvanized, 24 @ 25; Scotch and English Pig Iron, 1/2 ton, \$34 00 @ \$35 00; White Pig, 1/2 ton, 32 @ 33 00; Refined Bar, bad assortment, 1/2 lb., 04 @ 04 1/2; Refined Bar, good assortment, 1/2 lb., 04 1/2 @ 04 1/2; Boiler, No. 1 to 3, 04 1/2 @ 04 1/2; Plate, No. 5 to 9, 04 1/2 @ 04 1/2; Sheet, No. 10 to 20, 05 @ 05 1/2; Sheet, No. 24 to 27, 05 @ 05 1/2; Copper.—Duty: Sheathing, 3/4 @ 1/2; Pig and Bar, 2 1/2 @ 2 1/2; Sheathing, 1/2 lb., 20 @ 21; Sheathing, Yellow, 20 @ 21; Sheathing, Old Yellow, 10 @ 11; Composition, 10 @ 11; Composition Bolts, 20 @ 22; TIN PLATES.—Duty: 25 per cent. ad valorem. Plates, Charcoal, 1/2 @ 10; 10 @ 10; 10 @ 10; Roofing Plates, 10 @ 10; Rancin Tin Slabs, 1/2 lb., 04 @ 04; Scotch, English and Welsh, 1/2 lb., 04 @ 04; QUICKSILVER.—1/2 lb., 06 @ 07; LEAD.—Pig, 1/2 lb., 06 @ 07; Sheet, 09 @ 09; Zinc, 1/2 lb., 08 @ 08; ZINC.—Sheets, 1/2 lb., 10 1/2 @ 11; BORAX, 25 @ 35.

IRON.—Duty: Pig, 51 1/2 ton: Railroad, 60 @ 100 lbs; Bar, 10 1/2 @ 11 1/2; Sheet, polished, 30 @ 35; common, 15 @ 20; 1/2 in. Plate, 31 1/2; Pipe, 15 @ 17; Galvanized, 24 @ 25; Scotch and English Pig Iron, 1/2 ton, \$34 00 @ \$35 00; White Pig, 1/2 ton, 32 @ 33 00; Refined Bar, bad assortment, 1/2 lb., 04 @ 04 1/2; Refined Bar, good assortment, 1/2 lb., 04 1/2 @ 04 1/2; Boiler, No. 1 to 3, 04 1/2 @ 04 1/2; Plate, No. 5 to 9, 04 1/2 @ 04 1/2; Sheet, No. 10 to 20, 05 @ 05 1/2; Sheet, No. 24 to 27, 05 @ 05 1/2; Copper.—Duty: Sheathing, 3/4 @ 1/2; Pig and Bar, 2 1/2 @ 2 1/2; Sheathing, 1/2 lb., 20 @ 21; Sheathing, Yellow, 20 @ 21; Sheathing, Old Yellow, 10 @ 11; Composition, 10 @ 11; Composition Bolts, 20 @ 22; TIN PLATES.—Duty: 25 per cent. ad valorem. Plates, Charcoal, 1/2 @ 10; 10 @ 10; 10 @ 10; Roofing Plates, 10 @ 10; Rancin Tin Slabs, 1/2 lb., 04 @ 04; Scotch, English and Welsh, 1/2 lb., 04 @ 04; QUICKSILVER.—1/2 lb., 06 @ 07; LEAD.—Pig, 1/2 lb., 06 @ 07; Sheet, 09 @ 09; Zinc, 1/2 lb., 08 @ 08; ZINC.—Sheets, 1/2 lb., 10 1/2 @ 11; BORAX, 25 @ 35.

IRON.—Duty: Pig, 51 1/2 ton: Railroad, 60 @ 100 lbs; Bar, 10 1/2 @ 11 1/2; Sheet, polished, 30 @ 35; common, 15 @ 20; 1/2 in. Plate, 31 1/2; Pipe, 15 @ 17; Galvanized, 24 @ 25; Scotch and English Pig Iron, 1/2 ton, \$34 00 @ \$35 00; White Pig, 1/2 ton, 32 @ 33 00; Refined Bar, bad assortment, 1/2 lb., 04 @ 04 1/2; Refined Bar, good assortment, 1/2 lb., 04 1/2 @ 04 1/2; Boiler, No. 1 to 3, 04 1/2 @ 04 1/2; Plate, No. 5 to 9, 04 1/2 @ 04 1/2; Sheet, No. 10 to 20, 05 @ 05 1/2; Sheet, No. 24 to 27, 05 @ 05 1/2; Copper.—Duty: Sheathing, 3/4 @ 1/2; Pig and Bar, 2 1/2 @ 2 1/2; Sheathing, 1/2 lb., 20 @ 21; Sheathing, Yellow, 20 @ 21; Sheathing, Old Yellow, 10 @ 11; Composition, 10 @ 11; Composition Bolts, 20 @ 22; TIN PLATES.—Duty: 25 per cent. ad valorem. Plates, Charcoal, 1/2 @ 10; 10 @ 10; 10 @ 10; Roofing Plates, 10 @ 10; Rancin Tin Slabs, 1/2 lb., 04 @ 04; Scotch, English and Welsh, 1/2 lb., 04 @ 04; QUICKSILVER.—1/2 lb., 06 @ 07; LEAD.—Pig, 1/2 lb., 06 @ 07; Sheet, 09 @ 09; Zinc, 1/2 lb., 08 @ 08; ZINC.—Sheets, 1/2 lb., 10 1/2 @ 11; BORAX, 25 @ 35.

IRON.—Duty: Pig, 51 1/2 ton: Railroad, 60 @ 100 lbs; Bar, 10 1/2 @ 11 1/2; Sheet, polished, 30 @ 35; common, 15 @ 20; 1/2 in. Plate, 31 1/2; Pipe, 15 @ 17; Galvanized, 24 @ 25; Scotch and English Pig Iron, 1/2 ton, \$34 00 @ \$35 00; White Pig, 1/2 ton, 32 @ 33 00; Refined Bar, bad assortment, 1/2 lb., 04 @ 04 1/2; Refined Bar, good assortment,

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING FEBRUARY 28TH.

APPARATUS FOR CARBURETING AIR.—Alexander Dalrymple Bell, San Francisco.

TREADLE FOR SEWING MACHINES.—Francis E. Mills, San Francisco.

BALING PRESS.—Thomas J. Corning, San José, Cal.

ANCHOR.—William M. Hughes, San Francisco.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

PLOW.—J. P. Pritchard, Conn Valley, Napa county, Cal. This invention relates to that class of side-hill plows, in which two plows are attached to a shaft upon which they can be revolved so as to convert it into a right or left-hand plow as desired. The construction is such, that when it is at work, one of the plows is held and carried in a position approximating to a right angle with the other; when it is desired to reverse them, the plow is allowed to turn until both landsides rest upon the ground, when, by means of a lever releasing a catch, the bram and handles can be turned to the opposite side and the position of the plows changed without stopping the team and without effort on the part of the plowman. This device can be used also for cultivating level land, using either the right or left-hand plow for this purpose.

ELECTRO-MAGNETIC SEWING MACHINE.—G. Stevens and J. Hendy, S. F. The sewing machine is undoubtedly one of the most useful inventions of the age, and its effect in ameliorating the condition of the poor sewing woman of the large cities, to say nothing of other benefits, is stated to be most important. Yet objections have been made by medical men on account of injurious physical effects arising from the common method of operating the machines by means of the treadle. As an obviolation of this trouble, Messrs. S. and H. have invented an improved method of driving the apparatus by means of electricity. Their invention consists in a novel arrangement of the electro-motor by which greater power is obtained from the coils; in a device for regulating the power and speed; in the simplicity of the feed movement; and in driving the needle-bar directly from the armatures or coils, without the intervention of cranks or wheels of any sort, which occasion much loss of power.

TRADE MARK.—Dr. G. C. Furber, Yreka, Siskiyou county, Cal. This trade mark is designed to protect a medicine patented by the doctor and known as Furber's Cordial of Mountain Balm and Oregon Grape. The plants from which the main constituents of the compound are derived, have been used for long periods of time and are known to have a beneficial effect in many classes of disease, as many of our readers can doubtless testify from their own experience; hence it can be readily believed that, as stated, its virtues are not merely visionary. We have been informed of several cases where the effect of the compound is given as most beneficial.

BOOT JACK.—E. Coleman, S. F. This is an improvement on a small but important article of "every gentleman's furniture,"—and consists principally in an addition to the ordinary boot jack by which the toe of the boot is held while it is being drawn from the foot. The arrangement is such that the boot jack will be rendered much more convenient, and useful for the purpose for which it is intended. We have tried it and found it very convenient, and the fat man who occasionally pervades our office and who, by the way, has not been able to see his pedal extremities for the last ten years, declares that it is the "best thing ever invented."

The American Turbine Wheel.

That apparatus which enables one to utilize to the best advantage the resources provided by nature, is of the highest importance; and as water is so general a power and used by the farmer, the miner and the mechanic, the best water wheel is of interest to each of these classes. The over-shot wheel can often be used and give excellent results, and often it cannot be applied and some other form of machinery must be sought. In such a case the turbine will come into play, and as this wheel has been perfected in its details of construction, it is being introduced with advantage often where an over-shot wheel might be used.

We illustrate this week a form of turbine which claims superiority over other forms, and which is said by its manufacturers to give equally as much power as can be obtained from the best overshot wheel, usually considered the best form as far as this one point is concerned. In the place of the overshot or breast wheels, they say, "with their ponderous gearing, which are very expensive and a constant source of annoyance to those using them, the American Turbine comes as a welcome friend. Instead of wheels of 25 or 30 feet diameter, our turbines of as many inches diameter take their place, and perform the same amount of work (and in most instances much more) with the same amount of water."

The wheels and cases of the American turbine water wheels are made entirely of iron, with a bridgetree above and below, secured firmly to the

step, or pressure to one side.

There are six to twelve graduated shutes on each wheel, depending on their diameter. Each gate and shute is cast in one piece and moves horizontally; the shutes being hinged at a point near the inside of the case, or point of depletion. Thus, as the gates are opened or closed, it will be seen that the shutes move with the gates, as at Fig. 2; the upper portion of the case is removed to show their form. The lines behind the shutes represent the guards which are cast between the upper and lower plates of the case. These guards relieve the gates from the hydrostatic pressure of the head; consequently the gates are easily opened and closed by a ring and levers, operated with a segment and pinion.

AMERICAN TURBINE WATER WHEEL.—PERSPECTIVE VIEW.

AMERICAN TURBINE WATER WHEEL.—SECTIONAL VIEW.

The gate rod, on which the pinion is placed, passes up through the husk or floor, with a hand-wheel on the upper end, for the purpose of operating the gates. Whether the gates are fully or partially opened, the shutes are always adjusted to suit the amount of water admitted through the gates, and therefore the wheels will produce as high per cent. of power with half, as with full gates. This is a point in which turbine wheels hitherto have been seriously defective.

There are other points which might be dwelt on at greater length, but we must refer our readers to the engravings, and to the manufacturers and patentees, Messrs. Stout, Mills and Temple, of the Globe Iron Works, Dayton, Ohio. These gentlemen have worked for a long time, and with evident intelligence, and their device certainly deserves careful examination.

Lawn Mower.

There comes to us the description of a very neat lawn mower, which seems to embody the good points of many other machines, without their objectionable features. This is the so-called "Landscape" mower, an illustration of which is here

THE "LANDSCAPE" LAWN MOWER.

given, and of certain points of which mention may be made.

For throwing the machine in or out of gear, in place of a ratchet and spring, a patent friction pawl is used, so that the mower is always in gear when going forward, and always out of gear, and noiseless, when going backwards. This pawl is entirely concealed, and, like the gearing, is protected from obstructions by grass, dirt and other substances.

By means of an adjustable roller, in the rear of the knife bar, an easily-running machine is produced, which, we are told, accommodates itself to any unevenness of the

ground, mowing borders or lawns alike, complete without trouble of change, and thus dispensing with shoes or rollers in front of the cutter, which beat down the grass and make it impossible to cut evenly.

The cutting surfaces are made of the best cast steel, hardened and tempered, and attached to a heavy fly in a very substantial manner. The whole machine is built with great care, and weighs 65 pounds. It cuts a 15-inch swath and can be operated by anybody. The price is \$25. The manufacturers claim long experience with lawn mowers of every description, and that they can recommend this with perfect confidence in its merits. They seem to have a very good article. For particulars, apply to Hovey & Co., No. 57 State street, Chicago, Ill.

NORTHERN PACIFIC RAILROAD TO BE THE SHORTEST ROUTE TO RUSSIA.—The N. Y. *Tribune* says: It is an interesting fact that the war between Germany and France has casually demonstrated the truth that the shortest line of communication between the mouth of the Amoor and St. Petersburg is by way of Puget Sound and New York city. On the 13th of November the North German bark Galatea arrived at Port Townsend, on the Sound, bringing dispatches for the Russian Government, commercial letters and drafts from Nicolaivski, to be forwarded to St. Petersburg. The vessel also brought letters to be forwarded to Bremen. These all were mailed at our post-office in Port Townsend. Duplicates had been previously sent overland from Nicolaivski by way of Moscow. The bark was 28 days from the mouth of the Amoor. Allowing 12 days for the mail to go from Port Townsend to New York, and 20 days from here to St. Petersburg, the Galatea's mail would reach the Russian capital in 60 days from the Amoor by way of Puget Sound. The duplicate mail by way of Moscow, the Galatea's captain said, would take 90 days for delivery, unless carried on snow, when it would take 65 days. The shortest time across the United States, it will be noted, was made by using a sailing vessel. It seems apparent that when the Northern Pacific Railroad is complete and a line of steamers runs between the Amoor and Puget Sound, not only will the East Russian mails come through New York, but an immense trade, which is now dormant or non-existent, will pass over that road to take shipping in our harbor.

QUICKSILVER.—The San José *Independent* says that the Almaden Mine is turning out a larger quantity of ore than it did last summer, some new pockets having been struck which pay from 25 to 35 per cent. The production has increased from 800 flasks to which it had at one time sunk, to twelve or fifteen hundred flasks per month. * * * The Vallecito *Chronicle* of March 7th, says:—Work continues to be prosecuted on the cinnamon lode four miles from Vallejo, and Mr. Dennis, the superintendent of operations, is authority for the statement that a vein of paying rock rich in cinnamon has been struck in a new tunnel at a distance of 145 feet in the hill. There are favorable indications of a quicksilver development of great richness, and the probabilities are that the stockholders will be amply remunerated for all their labor and expense in the work of exploration. * * * The Santa Cruz Quicksilver Company is developing a promising ledge. * * * The Bella Union quicksilver mine, situated on the west side of Napa Valley, has been sold to a San Francisco company, for the sum of \$75,000.

GEOLOGY IN OREGON.—The Salem, Oregon, correspondent of the *Union* says:—Rev. Thos. Condon, at the Dalles, possesses a cabinet of specimens acquired during various summer excursions, which is one of the few scientific wonders, and lately he lectured upon his favorite art at Portland, his text being, "Three Stone Heads," which three were veritable specimens he had dug from the sandstone chronicles, and presented to his audience as representing three different periods. These were skulls of a family anterior to the mammoth and the elephant, and of a race as huge as they, dug from the strata, disclosed by a ravine, on John Day river, where a wall 1,500 feet deep, whose face was cut by the waters of many centuries, reveals to the philosopher the secrets of an era before man existed, and even before the Cascade mountains had risen to form a barrier to the ocean.

BET SUGAR IN COLORADO.—The question of the manufacture of beet sugar is being agitated by the people of Colorado.

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARR before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Chlorine—Common Salt.

LECT. IV. March 11.—Chlorine was first discovered by a Swedish chemist, in 1774, who, however, thought that it was a compound and called it muriatic acid. In 1809, a French chemist found reason to consider it an element, and in 1810, an Englishman, Sir Humphrey Davy, showed conclusively that it was a compound, and named it chlorine, (from the Greek word *Chloros*, green) from its color.

Chlorine is a yellowish greenish gas. It is found quite widely distributed in nature, but always combined with another substance. It occurs very commonly with sodium as chloride of sodium, or common salt, of which it constitutes 60 per cent. It also occurs quite commonly with magnesium. Chloride of sodium and chloride of magnesium constitute between 2½ and 3 per cent. of the sea water.

Salt is found almost everywhere in the soil to some extent. Sometimes it occurs in large amounts in beds, as near Cracow, Austrian Silesia, and in Spain. It dissolves readily in water, and as this leaches through the soil, it takes up the salt, conveying it to springs, to lakes, rivers and the ocean. The ocean is indeed a great salt pan. The water brings salt into it, is evaporated (leaving the salt) and falls on the land to furnish a fresh supply. Thus salt has accumulated to a large extent, and in some inland seas, which have no outlet, the water holds up to 20 or 25 per cent., as in Salt Lake and the Dead Sea.

We can obtain chlorine either directly or indirectly from salt. It is more convenient to obtain it indirectly, from chlorohydric acid, a compound of chlorine and hydrogen, which we get from salt. If we subject chlorohydric acid to the action of oxide of manganese, which occurs as an ore, part of the oxygen of this substance seizes on the hydrogen of the acid, forming water, and chlorine is set free. It is perhaps more economical for this purpose to heat salt, oxide of manganese and sulphuric acid together.

Chlorine—Its Properties.

Chlorine, as I said before, is a yellowish greenish gas. It is two and a half times as heavy as air. It cannot be breathed with safety unless greatly diluted with air, irritating the mucous membranes of the air passages, and producing very serious results if taken in large amounts. It is found, however, to be sometimes beneficial for certain throat troubles, if very dilute.

If I introduce a lighted taper into this jar of chlorine gas, it burns feebly at the mouth of the jar, producing considerable smoke, and is then extinguished.

This piece of phosphorus, which I put into chlorine gas, burns, giving off a white smoke, which is a compound of chlorine and phosphorus. The affinity of the two is so strong that we can get them to combine even under water. In this vessel, which is partly full of water, I have chloride of potash and some pieces of phosphorus. Now I carefully add a little sulphuric acid, which decomposes the chloride of potash, and the chlorine then attacks the phosphorus with such energy that there is a lively combustion in the water.

Chlorine unites with many metals with greater energy than does oxygen. Pouring metallic arsenic, in fine powder, into the gas, we have a shower of fire. This would be the case with gold, antimony, silver and copper. Here we have combustion without oxygen; it is merely the effect of chemical energy. If we had used oxygen in our experiment, we should have been obliged to raise the temperature of the metal to get combustion or chemical union.

Making Salt—Affinity for Hydrogen.

By heating a piece of sodium until it commences to burn and then introducing it into the jar, I get common salt. This shows the wonderful change in the nature of substances when they unite to form a chemical compound. We could not partake of either chlorine or sodium before they were combined, but afterwards they afford a most important article of diet.

Chlorine depends for its uses in the arts on its affinity of hydrogen. I can demonstrate this affinity by a simple experiment. Oil of turpentine holds a large relative amount of hydrogen in connection with carbon. I wet this paper with the turpentine (thus getting it in a fine state of sub-

division) and introduce it into the gas. It burns readily with a dense, black smoke, which is nothing but carbon. Carbon has been set free and chlorohydric (or hydrochloric) acid formed. [The lecturer performed several similar experiments.]

In these experiments we have had the hydrogen in compounds. But I can make hydrogen gas combine directly with chlorine by burning it and introducing the flame into chlorine gas.

We can make chlorohydric acid by treating salt with sulphuric acid. Chlorine is readily absorbed in water, one measure of water dissolving two measures of chlorine.

Bleaching—Purifying Agent.

If we introduce a piece of colored muslin into chlorine water (water in which chlorine has been absorbed), it will be quickly bleached. If we hang a piece of wet-colored muslin in chlorine gas, the same effect is produced. If we pour chlorine water upon ink, the ink loses its color. Chlorine bleaches and destroys colors derived from the animal and vegetable kingdom. It does this by taking out the hydrogen which they all contain, thus decomposing them. Hence it is largely used as a bleaching agent, and by it many materials can be rendered perfectly white in a few hours; while by the old method of laying them out in the sun, weeks and even months were required. In practice, the cloth, or paper, or other material, is cleansed from any grease and then subjected to the action of the chloridizing agent, which is generally chloride of lime, a substance which gives up its chlorine very easily. This is made by passing chlorine into a chamber on the floor of which is spread freshly slaked lime. This takes up the chlorine, but gives it up again on mere exposure to the air.

An old method of bleaching was by using sulphur fumes. Pliny speaks of this method. In this, the sulphurous acid unites with the coloring matter to a colorless compound, but as it is gradually oxidized to a sulphate and then frees itself from the coloring matter, such bleaching is not permanent. But chlorine destroys the coloring matter by decomposing it.

Chlorine is a powerful disinfecting agent and is used to destroy many offensive gaseous compounds. It does this just as it bleaches, by decomposing the gases, depriving them of their hydrogen. We often see chloride of lime used in a sick apartment or elsewhere. The carbonic acid in the air seizes the lime, forming carbonate of lime, and the chlorine is set free. It is hardly necessary to say that one must be careful not to use too much of this agent.

SINGULAR COLOR.—A pond between this city and Anaheim has, during the last few weeks, excited the attention of the neighboring inhabitants by gradually changing its color, finally assuming a blood-red tinge. A bottle of the water was brought to this city and subjected to analysis by Dr. Hays. The microscope failed to explain the mystery, but application of chemical tests revealed the presence of minute particles of vegetable matter, and precipitated them so that the reddish hue of the water could be distinguished at a distance. Here is an opening for the research of a naturalist.—*Los Angeles News*.

OIL IN LIVERMORE VALLEY.—A letter from Livermore to the *Alameda Advocate* says that there is quite an oil excitement there. A well was sunk 55 feet when a gas commenced to issue which took fire (from a candle) and burned brilliantly. There is a constant roaring going on in the bottom of the well and the water in the well is as blue as indigo, and smells of coal oil and sulphur. The gravel that comes from the bottom of the well is covered with some bright metallic substance, the color of gold. There is one thing sure, if there is nothing else, they have struck a "bully gas mine."

SUBSTITUTE FOR FIRE BRICK.—We noticed yesterday at the railroad depot several specimens of grey rock, resembling at first appearance granite, but weighing little more than lava, which are being sent to T. H. Selby, San Francisco, for the purpose of testing its qualities as a substitute for fire brick. The rock is said to be found in great quantities near the Cerro Gordo mines, in Inyo county, and has been, it is said, used in the furnaces of the celebrated Belshaw Smelting Works, and found to be equal, if not superior to the first-class fire brick.—*Los Angeles News*.

WORK ON THE TUNNEL (through the Sierra) of Lake Tahoe and San Francisco Water Works will be commenced in earnest this spring.

THE Thompson Road Steamer has been doing good work at Stockton.

GOOD HEALTH.

Vaccination.

[Written for the PRESS.]

Vaccination (from the Latin *vacca* a cow,) was discovered and reduced to practice by Dr. Jenner, of Gloucester, England, in the year 1798. Previous to that time, it was estimated, that, at least one-tenth of the deaths among the people were caused by small pox. In 1795 it is stated that thirty-six thousand people died of small pox, in England alone, in one year.

In consideration of the unspeakable benefits which his discovery conferred upon the people of Great Britain and the world, the English Parliament gave him the handsome sum of about one hundred and fifty thousand dollars in gold. This, however, was not his only reward, for history will hand the name of Jenner down through untold generations, for ages to come, as one of the greatest benefactors of mankind. His important discovery has banished, wherever practiced, one of the most fatal diseases to which the human family were subjected; for medical testimony is unanimous in the declaration, that vaccination is the only protection against small pox, and that when the system is fully under the vaccine influence, the protection is perfect.

Long before the discovery of Jenner it was known that in certain districts, cows were affected with a disease called *kine pox* (literally cow pox) similar in almost all respects to small pox, and that the same was sometimes communicated to the hands of persons engaged in milking them. It was also known that those who had at any time previously contracted the *kine pox* from the cow, were protected against epidemic small pox. In the investigation of the subject, Jenner discovered that such persons were also protected against the action of small pox virus inoculated into the circulation. Jenner discovered also, that the small pox virus inoculated into the udder of the cow, produced an eruption in every respect like the *kine pox*, which in turn resembled the small pox pustule, but very much modified in intensity, and that the disease from the cow could be passed into the circulation of the human body at will, where it would work perfect protection against small pox. It was also found that virus taken from the pustules of persons afflicted with *kine pox*, and introduced into the circulation of others, would produce in them the *kine pox* pustule, and that vaccination, from one person to another, was as effectual a protection against small pox, all other things being equal, as where the virus was obtained directly from the cow.

The above constitutes substantially the discovery of Jenner.

Dangers from Vaccination.

Subsequent investigations, however, have shown, that there is one serious objection to virus taken promiscuously from the human subject, as it has been found, that when persons are vaccinated who are afflicted with scrofulous, syphilitic, or syctic dyscrasias, popularly known as "blood diseases," is liable to become incorporated with the vaccine virus, and is capable of being communicated to others having "pure blood," thereby introducing into their systems diseases which are sometimes quite difficult to cure, although generally curable.

There is one other consideration which deserves mention, namely:

Persons who have inherited any such dyscrasia from their parents, that remains latent, may have the same aroused into fearful activity, even sufficient to cause death by the action of and union with pure vaccine matter. All persons therefore whose parents have suffered from any of the aforesaid diseases, or any kind of chronic eruptive disease or from any kind of malignant tumor or ulcer, although apparently perfectly healthy, should, both before and after vaccination, receive proper medical treatment in order to rid the system of any such dyscrasia. After taking the aforesaid primary precautions it then becomes indispensably necessary to use the pure cow pox virus, or if this cannot be obtained, that from persons who have perfectly "pure blood." By so doing perfect safety is secured. So important is the use of pure cow pox virus considered in some parts of Europe that some people

make a regular business of its production for domestic use and for export. The most reliable virus that we have in this country is imported from Germany in very small hermetically-sealed glass tubes.

The medical profession and all other persons are recommended to observe the above precautions most carefully. In order that this article may be understood by everybody, I will explain that *variola* is the name usually employed by medical men for small pox, while *varioid* (literally like variola) is a very mild form of variola which sometimes affects persons after exposure to small pox who have been previously vaccinated, as will be hereafter explained.

I will also explain here that the operations of inoculation and of vaccination are precisely the same, the difference being simply in the kind of virus used.

The various modifications and changes to which the operation may be defined are as follows:

Important Considerations.

1st. Matter from a small pox pustule introduced or inoculated (literally, ingrafted) into the circulation of a person who had never had small pox or been vaccinated, will produce in him genuine small pox. Dilute the matter to any extent with water and the result will be the same.

2d. Matter from a small pox pustule introduced into the udder of the cow will produce in it a pustule, matter from which in turn introduced into the human system will produce genuine *kine pox*.

3d. Matter from a small pox pustule diluted with cows' milk and introduced into the human system will also produce the *kine pox* pustule. This last proposition was verified by Dr. Basil Thiele in 3,000 cases without a single exception.

Observations on many thousands of cases lead to the following conclusions, as a rule, with some exceptions, to wit:

1st. Every person who has not been vaccinated is liable to have small pox if exposed to either variola or varioid.

2d. Vaccination when perfect is a sure protection against small pox for life.

3d. Every person is more or less subject to the action of the vaccine virus.

4th. Persons vaccinated in infancy or childhood will never have small pox; but are liable to have varioid after puberty, if exposed to either variola or varioid. Varioid as a rule never affects any one before puberty.

5th. At puberty the system undergoes a change, which makes vaccination again necessary to protect it against varioid.

6th. Re-vaccination after puberty is a sure protection against varioid.

7th. A third vaccination is never necessary.

8th. Re-vaccination is never necessary if the first operation was performed after puberty.

9th. If every person was perfectly vaccinated before puberty, and re-vaccinated after puberty, small pox would disappear forever from the earth.

E. J. FRAZER, M. D.

108 Stockton St., San Francisco.

[Communicated.]

ICED-WATER APPLICATIONS IN CROUP.—Dr. McFarlane states that having employed this in "at least two hundred cases" of croup, he can confidently recommend it. Folds of linen or muslin, large enough to cover the whole throat and upper part of the sternum, just sufficiently wet dripping, should be covered with several thicknesses of flannel, the whole being secured by a handkerchief. When great cold is wanted, two wet cloths should be alternately applied. When the treatment is commenced early, a few hours may suffice to subdue the disease; but in neglected cases several days may be required.

The above manner of treating croup is undoubtedly the best ever used; and should be known by every mother in the land. To make the cure certain in every case, wrap the patient in a large blanket and put the feet in hot water, to induce perspiration. Then slipping the iced cloths down about the throat and over the chest, without removing the flannels you have the advantage of keeping the inflamed portion cold, while you are assisting nature in keeping the skin active. Two very necessary steps to be taken in the removal of the cause of this disease. L. P. J.

Dr. Poillon, a French physician, says a cold can be cured by inhaling hartshorn. The inhalation by the nose should be seven or eight times in five minutes.

Tubular Lantern, Ill.; Band-Sawing Machine, Ill.....	172

Notices to Correspondents.

J. L. Rough & Ready.—Platinum has been found in a large number of places on this coast, and very likely exists in other localities than those already known. Mr. R. M. Raynor, 57 Broad street, New York City, is ready to purchase the platinum sand. The price paid therefor varies, of course, with the amount of platinum contained. For lots which are guaranteed to hold 45 per cent, from \$120 to \$130, gold, will be paid, and perhaps more. Letters addressed directly to Mr. Raynor will be answered fully.

P. H. H. Oakland.—Your question is answered on another page.

Assay of Gold Ores.

Mr. J. M. Merrick, Jr., writes to the *American Chemist* concerning what he has "found in numerous assays an elegant method of reducing the lead button to a size suitable for cupellation." This is scorification with saltpetre. It requires some little practice, but he considers it a valuable adjunct to the present methods.

He puts the button—which is too large to cupel, perhaps 100 to 180 grammes in weight—into a Hessian crucible, and heats the crucible until it is red hot, and the lead is well melted. Then he adds about half the weight (of lead) of potassic nitrate and raises the heat until the crucible, which should be pretty capacious, is *white hot* to the very rim. Stir the contents with an iron rod, and take out the crucible before the oxide of lead has eaten through it; cool and break, and, if necessary, repeat the scorification two or three times. The only points where caution is required, are the keeping the crucible at a full white-heat, and taking it out before there is risk of injury.

"This method," he says, "may be carried a step farther, and the gold obtained as the result of the last scorification; and I know one assayer who frequently determines the value of gold ores in this way, omitting cupellation altogether." We cannot see the advantage of this, and should think it impracticable in the usual gold assays.

Our Bullion Product.

We have been asked what the condition of the controversy is between the Commissioner of Mining Statistics and the *Alta California* and Mr. Garnett, one side of which has been published in the *Alta*, and reference to which was made some time ago in the *Bulletin*. We shall endeavor to answer with impartiality, and to deal fairly with both sides, which we are perhaps in a good position to do as we have no prejudices on either side to influence us one way or the other. We shall merely discuss the merits of the arguments advanced.

The points at issue may be stated as two: Whether Mr. Raymond's estimates of the bullion production of the United States for the year 1869 are correct; and whether he has awarded a sufficient amount for that year to California. The parties are: Mr. Raymond and the *Eng. and Min. Journal* on one side, the *Alta*, and Mr. Garnett on the other.

Mr. Raymond estimated the bullion product for 1869 as \$63,500,000, of which he allowed \$20,000,000 to California.

The *Alta* attacked these generally, but took up more especially the relative proportion awarded California. It gave figures "in illustration of the production of this coast" and also statistics of the production of gold for the whole Union, and of the gold and silver sent to the mint and exported from this city. It then stated, "Thus, instead of California having less than one-third, it has three-fifths of the gold" produced in the whole country. If there is any deduction to be drawn from the figures and this remark, it is that all bullion received here is derived from California. But as the *Alta* afterwards disclaims this, ("We did not give these as the product of California alone, but as the product of the coast"), we cannot see any point in giving the illustration, and must fall back on the general statement that the Commissioner's Report is to be classed among those which are frequently "unintelligent estimates and of very little value." This is rather a sweeping assertion to make without direct support, and we may dismiss this matter. The *Alta's* remarks afterwards do not touch on the California question, but the sum of its argument is that the general production is given with nearly perfect accuracy by the Mint and Custom House, which brings us to the second question. The *Eng. & Min. Journal*, we may remark, corrects Mr. Raymond's California product to \$22,000,000, instead of \$20,000,000, taking the difference from Montana and thus not affecting the total.

The second point is the total production of the U. S. for 1869, and on this Mr. Garnett makes the fight for his side. Mr. Garnett places the production at \$45,000,000, or \$18,500,000 less than Mr. Raymond does. He gets his statistics by a method based on the theory "that native gold is not hoarded as bullion nor used to any extent in the arts. Our entire product of gold, therefore, must either find its way into our mints for coinage, or must be exported as bullion." The *Eng. & Min. Journal* declares the theory wrong and the method fallacious on the grounds that, 1st, it does not accurately obtain the domestic coinage or exports, and 2d, that it does not include gold and silver, native and refined, used in manufactures, shipped in ores and mattes, exported in private hands, hoarded in specimens, bars, etc., or produced but not deposited for coinage or exported.

We do not propose to defend Mr. Garnett's theory or anybody else's, leaving that to the respective authors. Our only province is to speak generally of the arguments advanced in this discussion, and our simplest way at arriving at a conclusion is to enquire whether the reasons advanced by the *Eng. and Min. Journal* will

account for so great a difference as \$18,500,000.

We shall, for the sake of argument, allow a liberal sum, say \$1,000,000, in Mr. Raymond's favor (although the items in the *Eng. & Min. Journal* which are adduced in this connection would rather tend the other way) for the alleged mistake in domestic coinage and exports. On the other hand, we shall allow but little (or nothing, in view of the former allowance) as to the amounts exported in private hands or hoarded in specimens, bars, etc. We shall also allow nothing for the bullion produced but not deposited for coinage or exported, on the ground that this will balance itself from year to year. We have left the amounts shipped in ores and mattes, and used in manufactures, and it is this last item (manufactures) which must be shown to form far the largest part of the \$17,500,000.

Here we have opposing statements on this point. Mr. Garnett does not believe that much bullion is thus used which is not accounted for in the mint reports; the other side states the opposite, and intimates that it has proofs thereof. We should desire to see decisive evidence given in the matter; but for our part we are very doubtful as to whether, to say the least, it can form a large fraction of the sum mentioned above.

It is but fair to Mr. Raymond, in dealing with this question, to say that his figures were called, from the commencement, "estimates," while Mr. Garnett's were more positively stated. At the same time we are told distinctly what Mr. Garnett's method is, while the information on the other side is less precise. It is also but fair to ourselves to say that we have dealt in general terms in this last question, making liberal allowances in order to be able to get at a general conclusion.

Mechanics' Institute.

The quarterly report (for December, January and February) of the President, Mr. Hallidie, shows on the whole a favorable and progressive condition of affairs. The financial status is better, for although the balance on hand, \$664.33, does not seem large, yet during the last three months over \$500 have been paid out for the coming Industrial Fair, and what is particularly gratifying, \$3,000 have been paid on account of the indebtedness of the society, reducing it to \$37,000. Moreover, the building has been painted and otherwise improved.

During the quarter 97 members joined the Institute. While a few leave each month, the average gain monthly is 30. Many valuable documents have been presented and 254 books purchased.

The lectures, commenced in the preceeding quarter by the Mechanic Arts College of the University of Cal., are still in progress, and students and visitors show no lack of interest, there being many applications to fill any vacancies which occur. The Institute generously allows the free use of a room for certain classes which lost their former quarters by the recent burning of the Lincoln school building.

By an amendment to the constitution, persons who have rendered the Institute distinguished services, can now be elected Honorary Members; but no more than ten honorary memberships can be conferred yearly.

The Eighth Industrial Exhibition.

The Trustees are earnestly at work preparing for the Eighth Industrial Exhibition, which is to open on Tuesday, August 8th, and which will probably be the last one for a number of years. Hence unusual efforts are being made to secure its success on a much larger scale than ever before attempted. Over 20,000 circulars have been distributed in the adjoining States and Territories and in the countries

on the Pacific Ocean, inviting co-operation. In reply, many words of encouragement, applications for space and enquiries have been received. Books have been opened for applications, and entries can be made at the Library daily,—from 12 m. to 9 p. m. An agent is canvassing this city, and Mr. Dunn has gone to Japan to induce a representation from that Empire and to obtain the appointment by the government of a commission to report on the exhibition and the manufactures of our coast. The Pacific Mail Steamship Co. has liberally offered to bring across the ocean articles free of charge. The exhibition building will be enlarged. The last Legislature appropriated \$1,500 per year for two years, to be expended in premiums by the society. Cash premiums amounting to \$3,350 are offered, besides those usually given. It is to be hoped that the whole coast will lend efficient aid, for the whole coast will be benefited by a successful exhibition.

Its Importance to the Coast.

We present briefly the substance of the President's remarks on this subject:

I do not think that the importance of these Industrial Fairs to a new country like ours, full of vigor, talent and industry, can be over-estimated. We are situated on the border of a new continent, undeveloped in its resources which we know to be vast and inexhaustible. We are in close proximity to countries densely populated by races whose traditional exclusiveness has kept them until recently in ignorance of the advance of science, art and manufactures, and whose necessities must create a demand for that talent which we can supply, unless in our blind mistake we kill the goose which lays the golden egg,—a mistake, I believe, caused mainly by fear of an overwhelming inroad of that people, a fear groundless because such an invasion over a vast ocean like the Pacific is practically impossible and beyond the records of history.

The Managers hope to see the mechanics, and manufacturers of our coast, at this Fair, show to these people with large wants, what we have and what we can do; to show them that we can turn out as good and as cheap machinery as any other part of the world; that we can furnish them with manufactured articles of all kinds; that we can supply their needs fully and cheaply. We have a huge market if we choose, and there is no reason why we should not erect manufactories to supply this market. We need manufactures here to develop our resources and enrich the community. [But the presence of factories requires a larger agricultural production, and thus is a direct benefit to farmers as well as to other classes of population.]

These Industrial Fairs tend generally to encourage enterprise and nurture industry by demonstrating the needs and the capabilities of our people. It is to be hoped that the people will lend prompt aid to an enterprise which cannot but benefit them.

MICROSCOPICAL.—Mr. J. Beck, of London, gave a very pleasant reception to the S. F. Microscopical Society last Tuesday, at the Cosmopolitan Hotel, when quite a number of persons interested in Microscopy were present. Mr. Beck showed a most exquisite microscope, which was worth somewhere about \$1,500. Under this, specimens of metacinnabarite and cinnabar, gold crystals from Owen's River, copper from the Union mine, silicified wood, and platinum and diamond sand from Coos Bay were examined. By means of the spectroscopic eye-glass attachment the lines of zircon and haematin were shown. The occasion was most pleasant and the visit of Mr. Beck has proved an interesting event of the week.

METACINNABARITE.—At the Redington mine, they have come into large amounts of this mineral, and beautiful specimens are obtained. Mr. Durand, who has charge of the Pioche collection, has given us another specimen (besides that mentioned a few weeks ago), which contains a number of small crystals, too small, however, and indistinct for us to decipher. Mr. Hanks has shown us a number of fine specimens in his cabinet.

Fire and Burglar-Proof Safes.

Our correspondent, W. H. M., has found, he writes us, a safe which is ahead of any he has hitherto seen, and which will afford a decidedly tough nut for any gentleman of burglarious proclivities to pick, or any fire to crack. We publish his communication on another page, giving here the illustration and description of the fire and burglar-proof safe and also of the combination lock.

The fire and burglar-proof safe consists of a fire-proof safe inside which is placed a burglar-proof safe, the walls between the outside and inside boxes being filled with a fire-proof concrete. The outside, or fire-proof safe has in the walls a patent concrete which acts as a non-conductor and is yet free from dampness, and which is claimed to be most perfect in its resistance to heat. The door is provided with a simple contrivance, technically termed a "dog," but more readily understood as a stationary bolt shutting into the side of the safe or door-frame on which the hinges are placed, which securely holds the door when closed, even though the hinges were entirely knocked off, which, however, can not be done, because of a portion of the hinge shutting into the door-frame when the safe is closed, and then acting as a bolt protected from damage by the outer plates. In addition to these "dogs," there are on all safes large enough to admit of them, bolts shutting into the top and bottom from the door, thus guarding upon every side against the possibility of opening the door by destroying its hinges.

Upon each safe door, a double flange or offset is made upon the edge, which presents an effectual bar to the admission of flame or fire when the safe is thus exposed. This is an advantage to which too much importance can not be attached.

In the inside or burglar-proof safe, the walls and door are composed of alternate plates of heavy plate iron, and of crystal steel, welded iron and steel of the finest quality, tempered to such a degree of hardness as to make them impervious to any drill. These alternate plates, after being dovetailed, are put together with heavy machine screws in such a manner as that no screw goes entirely through from the outside to the inside of the box, thus presenting no point at which a drill would not meet with the hardened steel. The whole mass is further secured by heavy conical drill-proof arbors, of hardened steel and iron, the steel being used to prevent drilling, the iron for its toughness, to prevent breaking. These arbors are securely fastened on the inside, so that it is impossible to drive them in. The corners of the safe are also dovetailed, and are further secured with angle-plate iron and steel of various thicknesses and widths on each angle. The walls are of a thickness of from one and a half to five inches, according to the number of plates used in their construction, and are impervious to all attacks.

The door is dovetailed in the same manner as the walls, and when closed its dovetails fit into each other with such exactness that it loses its vulnerability, and is as secure as any other portion of the safe. It has a tenon and groove in the back of the door fitting into corresponding tenons and grooves in the back jamb of the doorway of the safe. Upon it are placed strong wrought-iron bolts, from one and a quarter to two inches in diameter, firmly secured to a heavy wrought-iron frame, which is

held by heavy drill-proof conical bolts passing through every plate of the door and frame, adjusted in such a manner as to hold it secure at all points, when the bolts are thrown forward and locked, while the tenons and grooves in rear of the door hold it there securely against any violence which may be used. As an additional security against the jack-screw or any other force, Mr. Hall has also introduced a system of flat bolts, which, when the door is locked, shoot out from between the plates of the

order. It is fixed on the safe upon a conical drill-proof arbor or shaft, which connects the interior works of the lock with the dial on the outside. It is conical in shape, and is so ingeniously constructed that it can not by any possible means be driven in. It is connected upon the inner extremity with a projecting shoulder, working in a socket of solid steel and iron, so that it is equally impossible to draw it out or move it in the slightest degree from its proper position, by force or otherwise.

by the Hall's Safe and Lock Company, Ohio, concerning whom, further information is given on the third page.

MONTANA MINING IN GEORGIA.—It is not usual for Montanians to go to the Eastern States to work placer mines, but we have an instance of it to record for once. Mr. James Pierce, for the last year or two a miner at Pikes Peak, went home to Gainesville, Georgia, last fall, and writes Mr. Dick Kennon that he has set up his sluice

boxes there and intends to make some money. He has leased a farm, has a ditch that brings in 70 inches of water—enough by reservoiring to run all day. The ground is about five feet deep. Labor is 75 cents per day, without board. With these facilities, Mr. Pierce estimates he can clear \$5 per day to the land by introducing the Montana system of mining. He thinks it a good gold country, and says there are twenty prospect holes in this country to one there. We also learn that Mr. Jos. Bell, another Pilgrim Bar miner, has purchased or leased a farm near the same place, and says "he has as good a thing on mining as he wants."—*New North West.*

THE CALIFORNIA FILE MANUFACTURING COMPANY, whose works are situated at 437 Brannan street, in this city, inform us that they are now doing a fair business for themselves, and also a good deal of work for the mechanics and farmers of the coast, chiefly in the way of re-cutting old files and in the manufacture of reaper and mower sections, together with knives for all kinds of machines. In their estimation the principal drawback to the business of file re-cutting arises from the inferior quality of much of the work turned out in some of the earlier attempts, from imperfect tools, improper tempering and unskilled labor. While these obstacles are believed to be overcome, a better class of work is performed at greatly reduced rates.

SALT IN KERN COUNTY.

The *Courier* of March 4th, says:—On the east side of Kern Lake is a tract of country about two and a half miles in width, from north to south, and five miles in length to the eastward, which in every part throughout its whole extent affords brine in limitless quantities at a depth of from eight to ten feet. This brine is of greater strength than is usually furnished by brine springs, being equal to that used for the preservation of meats, and, in fact, has often been used for that purpose without concentration. It is found in a tough clayey stratum, beneath which pure fresh water is found. The salt rises to the surface, and in many places, in dry weather, might be gathered in a somewhat impure state in great quantities. At different times salt has been made here, by boiling and solar evaporation, of a quality for purity and strength surpassing any we have ever seen, but its production has never been entered on to any extent, or as a regular business.

CALIFORNIA GLOVE-MAKING.—E. T. McCausland, according to the *Trinity Journal*, of Weaverville, has a glove factory, where he makes a large number of buckskin gloves.

PUGET SOUND.—In Washington Territory, within 50 miles of the Sound, iron ore has been found, with coal and limestone within easy reach.

HALL'S PATENT FIRE AND BURGLAR-PROOF SAFE.

door into cavities of the jambs of the safe, thereby preventing any pressure being brought to bear upon the inside bolts. It is made flush with the outside surface of the safe door, and works so closely that there is no more chance of introducing

earlier attempts, from imperfect tools, improper tempering and unskilled labor. While these obstacles are believed to be

HALL'S PATENT COMBINATION LOCK.

The heavy, round bolts on the inside of the door are thrown into their places by the knob, and are held there by the strong, massive bolt of the lock, the latter having no work to perform but that of throwing its own bolt, which, passing into the jaws or clutch, prevents any pressure which might be attempted by means of the handle from the outside on its sides instead of end.

The lock is one of the very strong points of the safe. It has neither key nor key-hole, is operated by a register-dial, and has no springs which are so liable to get out of

powder or explosive fluids through it than through the solid walls of the safe. The arrangements of the tumblers is such that the changes possible count up in the billions.

It is claimed for these locks that they have never been picked or opened by burglars or experts, although the most skilled expert worked nine days on one of them, and gave it up, forfeiting \$1,000. The company hold themselves in readiness to put from \$1,000 to \$10,000 behind their lock against a like amount.

These safes and locks are manufactured

DOMESTIC ECONOMY.

Eating Without Appetite.

It is wrong to eat without appetite, for it shows there is no gastric juice in the stomach, and that nature does not need food, and there not being any fluid to receive and act upon it, it would remain there to putrefy—the very thought of which should be sufficient to deter any man from eating without an appetite for the remainder of his life. If a topic is taken to what the appetite, it is a mistaken course; for its only result is to cause one to eat more, when already an amount has been eaten beyond what the gastric juice supplied has been able to prepare. The object to be obtained is a larger supply of gastric juice, not of a larger supply of food; and whatever fails to accomplish that essential object fails to have any efficiency toward the cure of dyspeptic disease; and as the formation of gastric juice directly proportioned to the wear and waste of the system, which it is to be the means of supplying, and this wear and waste can only take place as the result of exercise, the point is reached again that the efficient remedy for dyspepsia is work—out-door work—beneficial and successful in direct proportion as it is agreeable, interesting and profitable.

COPPER COOKING UTENSILS.—Copper and brass vessels should not be used for cooking purposes, as poisonous chemical substances are liable to be formed by the action of oils and acids upon the substances of the vessels. The use of such vessels for cooking fruit is especially dangerous, as the acids of fruit act readily upon the metal, forming very poisonous substances.

KEEPING HAM.—Have a sack made of cheap muslin, or domestic, somewhat longer than is required to merely hold the ham. Then gather some broom sedge and chop it finely in your cutting box; or, if you happen to be minus such a contrivance, chop it with a hatchet or axe. Place a few handfuls of this in the bottom of your sack, and then having wrapped a newspaper nicely around your ham, slip it upon the chopped sedge. Proceed next to fill up the sack by ramming your chopped sedge tightly around the ham on all sides—the size of the sack should allow of its being an inch thick. Sew or tie up and the work is done.

Hams put up in this way will keep for years through all kinds of weather, for the sedge is cooling in its effect, it absorbs the moisture attracted by the salt, it hars off the fly. We take it that straw or thoroughly dried grass of almost any kind would act, though we have no experience with anything save broom sedge.

HOW TO MEND RUBBER SHOES.—Several letters having been received asking this question, Professor H. E. Colton prepared the following directions: Get a piece of pure rubber—an old shoe—vulcanized rubber will not do; cut it into small bits. Put it into a bottle and cover to twice its depth with spirits of turpentine or refined coal-tar naphtha—not petroleum naphtha. Stop the bottle and set one side, shaking it frequently. The rubber will soon dissolve. Then take the shoe and press the rip or cut close together, and put on the rubber solution with a camel's hair brush. Continue to apply so fast as it dries until a thorough coating is formed. Spirits of turpentine dissolves the rubber slowest, but forms the most elastic cement.

OAT MEAL AS FOOD.—If mothers would have their children grow up clear eyed and comely, with frames of bone and not of cartilage, with transparent complexions instead of muddy ones, then do not always set before them bread of fine flour and highly seasoned meats, but give them four or five times a week a breakfast of oat meal mush. Do you say they don't like it? Perhaps you don't know how to prepare it properly. The Scotch method of preparing oat meal, is to make a thin mush, a little thicker than gruel, and the boiling should continue three to five minutes (not more), after the thickening is finished. This eaten, with sugar or milk alone, or with syrup, is highly palatable, and is generally liked by children whose tastes are not vitiated.

THE USE OF BUTTERMILK.—Persons who have not been in the habit of drinking buttermilk consider it disagreeable, because it is slightly acid. There is not much nourishment in buttermilk, but the presence of the lactic acid assists the digestion of any food taken with it. The Welsh peasants almost live upon oat-cake and buttermilk. Invalids suffering from indigestion will do well to drink buttermilk at meal-times.

HOW TO MAKE OLD SALT PORK AS SWEET AND TENDER AS FRESH PIG'S MEAT.—There is no humbug about this, though it may look like it. We have tried it, and we know the person who discovered it, Mrs. Washington Champion, who thus has fresh, tender meat all the year round. It is simple but requires some labor. The thing is done by boiling and frying alternately, and finishing off with sweet milk boiling and frying also. Here is the receipt: Boil slowly in several waters till sufficiently freshened. Then boil in another water till reduced to a fry. The fryings should not take long—about fifteen minutes. Fry for a while till about half done or less, so as to get the water well out, else it will be snappish thereafter. Turn off the fat and pour on sweet milk, and fry until brown. Now you have something that is perfectly tender; the oil is not all fried out as is the case with some meat. The lean is tender with the rest. Pork even tainted or otherwise objectionable, may thus be treated to a great advantage. Will each house-wife that reads this receipt try it, and get the benefit of it? It is no humbug.—*Country Gentleman.*

WASH FOR THE HAIR.—"Honey water", as it is generally called, is a most pleasant and excellent wash for the hair, and is used by sponging it into the roots, and also by well brushing the hair with a little fluid at a time. Though called honey-water it is not made with honey, being prepared as follows:—Essence of ambergris, one drachm; essence of musk, one drachm; essence of bergamot, two drachms; oil of cloves, twenty drops; spirit of wine, six ounces; orange flower water, four ounces; distilled water, four ounces; mix altogether, and let them digest fourteen days, shaking ingredients frequently, then filter through porous paper for use. It is not only very useful as a hair-wash, but is an excellent odoriferous perfume.

SALT AS A CONDIMENT.—Salt as an addition, or condiment to food, is undoubtedly beneficial. Its immediate effect is to soften and dissolve the food, and thus render the process of digestion more perfect. It forms one of the constituents of the blood and of the body generally. If it be denied, digestion becomes impaired, and the body weak and liable to disease. It is however, a very different thing to eat salt with food and to live upon salted meats. In the latter case certain chemical effects are exerted upon the meat, and its nutrient constituents, by the salt, which modify considerably the nutriment afforded the body. It is of equal importance to the physical health and well being of the lower animals as to humanity, and as a medical agent it ranks among the most important.

WHY IS SOUP WHOLESOME.—The *London Food Journal* says: Physiologically, soup has great value to those who hurry to and fro from their meals, as it allows an interval of comparative rest to the fainting stomach before the substantial beef and mutton is attacked, rest before solid food being as important as rest after it. Let a hungry merchant or lawyer rush *in medias res*—plunge boldly into roast beef, and what is the result. The defeat is often as precipitate as was the attack. When the body is weary the stomach must be identified with it, and cannot therefore stand the shock of some illly masticated half-pound weight of beef. But if a plateful of light soup be gently insinuated into the system, nourishment will soon be introduced and strength will follow to receive more substantial material.

ASPARAGUS—WHITE AND GREEN.—All who buy this favorite esculent should remember that the white asparagus is not really fit to eat, that it is more or less poisonous, never having had the sun to purify it; besides it costs three or four times as much as the green, as only a small portion of it can be eaten, and this is often acid and unpleasant, while the green asparagus can all be eaten and is healthy—try it.

A FRENCH chemist asserts that if tea be ground like coffee before hot water is poured upon it, it will yield nearly double the amount of its exhilarating qualities. Another writer says: "If you put a piece of lump sugar, the size of a walnut, into a teapot, you will make the tea infuse in half the time." This last we have tried successfully.—*Ex.*

CHEAP PUDDING.—Soak one cup of bread crumbs in one quart of milk two hours, then add four eggs well beaten, one tablespoonful of butter, a little salt, nutmeg, and sweeten to taste. Bake one hour and a half.

BAKED APPLE-DUMPLINGS are delicious. Make them as if for boiling in the usual way; set them in a shallow pan; bake in a hot oven, and serve with hard sauce.

Domestic Receipts.

LIQUID BLUEING.—To one part of Prussian blue add gradually two parts of concentrated muriatic acid. Let the paste stand for twenty-four hours, then add nine parts of water, and bottle it.

The solution of indigo in sulphuric acid is also used for the same purpose. To prepare it, pulverize one ounce of pure indigo, and add it by degrees to four and a half ounces of concentrated sulphuric acid, mixing it well by stirring with a glass rod. If desired, the acid may afterwards be neutralized with carbonate of potash.

YEAST.—The following is recommended by first-rate authority as a method of making good yeast, that will keep for weeks, even in hot weather:—On Monday morning put two ounces of best bale hops into a gallon and a pint of cold water, boil half an hour, strain hot, and dissolve two ounces of finest table salt and half a pound of sugar in the liquor; when cooled to new milk warmth, put one pound of sifted flour into a large basin, make a well in the center of it with the hand, and add the liquor by degrees, stirring round and round with a spoon until the whole of the flour is evenly mixed with the liquor; set the pan containing the liquor on a stool by the stove, in winter time, day and night. In hot weather this is not requisite. On Wednesday morning boil and mash finely three pounds of good potatoes, and mix them with the liquor in the same way as the flour. On Thursday morning there should be a heavy dark scum on the surface. The yeast must now be stirred thoroughly and strained through a sieve or colander into a gallon jug, corked firmly, tied down, and placed in a cool cellar. Shake well before using.

TO REMOVE GREASE FROM SILK.—Rub together fine French chalk and spirits of lavender to the consistency of a thin paste, and apply thoroughly to the spots with the fingers; place a sheet of brown or blotting paper above and below the silk, and smooth it with a moderately heated iron. The French chalk may then be removed by brushing.

VANTY.—Take one egg, a very small pinch of salt, and the same of soda; mix very stiff with flour; then take enough of this stiff paste to spread out to the size of a sauce-plate. When rolled as thin as a wafer, drop it in clean sweet lard. As soon as it blisters, turn quickly. Take out, grate or sprinkle fine white sugar over it to fill the hollows formed by the blisters.

Mechanical Hints.

TO REVIVE THE COLOR OF FADED BLACK CLOTH OR LEATHER.—Take of the best quality of blue galls, four ounces; of logwood, clean sulphate of iron (copperas), clean iron filings and sumac leaves, each one ounce; put the galls, logwood and sumac berries into one quart of the best white wine vinegar, and heat to nearly the boiling point in a sand bath, then add the iron filings and copperas; digest for twenty-four hours, and strain for use. Apply with a sponge.

FURNITURE OIL.—To one quart of linseed oil add one ounce of bruised alkanet root, and boil them together in a glazed earthen vessel until the color is extracted from the root; then cool, and strain for use.

WOOD PRESERVATIVE.—In the *Annales de Genie Civile*, Dr. Reinsah gives the following directions for rendering wood difficult of combustion and preserving it underground. "The wood, unplanned, is to be placed for twenty-four hours in a liquid composed of one part of concentrated silicate of potassa and three of pure water. After being removed, and dried for several days, the wood is again to be soaked in this liquid, and, after being again dried, painted over with a mixture of one part of cement and four parts of the above liquid. When the first coat of this paint is dry, the painting is to be repeated twice. This paint mixture should only be made up in small quantities, as it rapidly becomes dry and hard. Wood thus treated becomes unflammable, and does not decay underground."

COLORLESS LACQUER.—Dissolve two and a half ounces of shellac in one pint of rectified spirits of wine; boil for a few minutes with five ounces of well-burned and recently heated animal charcoal. A small portion of the solution should then be filtered, and if not colorless, more charcoal must be added. When all color is removed, press the liquid through a piece of silk, and afterward filter through fine blotting paper.

MIXING VARNISHES.—When varnishes dry too quickly, by adding a small quantity of finishing varnish the trouble may be remedied.

Life Thoughts.

An old dog cannot alter his way of barking.

A DECEITFUL man is more hurtful than open war.

A nod from a lord is a breakfast for a fool.

He that fears you present, will hate you absent.

It is more easy to praise poverty than to bear it.

A PENNY worth of mirth is worth a pound of sorrow.

GRIEVING for misfortunes is adding gall to wormwood.

HOLD your little twinkling light boldly and honestly; then God will pour in the oil, and make it a blazing torch.

ALWAYS laugh when you can—it is a cheap medicine. Mirthfulness is a philosophy not well understood. It is the sunny side of existence.

Be not affronted at a jest. If one toss salt at thee, thou wilt receive no harm unless thou hast sore places.

WOULD a man frequently calculate his income and expenditure, he would escape many a bitter reflection; for he must be lost to every generous feeling of pride and honorable principle who wantonly incurs debt which he knows he can not discharge.

KIND WORDS! they are blessed things. Speak them every day. Scatter them like sunbeams everywhere. They please others and then return to bless your own ears. Kind words forever.

DO SOMETHING.—Luther says: "The human heart is like a mill-stone when you put wheat under it, it grinds into flour; if you put no wheat in it, it still grinds, but then it is itself it grinds, and slowly wears away."

GOOD sense will preserve us from censoriousness, will lead us to distinguish circumstances, keep us from looking after visionary perfection, and make us see things in their proper light.

The man at the head of the house can mar the happiness of the household, but he cannot make it. That must rest with the woman, and is her greatest privilege.

A KIND HEART.—It is kindly sympathy with human life that enables one to secure happiness. Pride is like an unsilvered glass through which all sights pass, leaving no impression. But sympathy, like a mirror, catches every thing that lives. The whole world makes pictures for a mirror-heart. The best of all is, that a kind heart and a keen eye are never within the sheriff's reach.

COURAGE IN EVERY-DAY LIFE.—Have the courage to discharge a debt while you have the money in your pocket.

Have the courage to do without that which you do not need, however much your eyes covet it.

Have the courage to speak your mind when it is necessary you should do so.

Have the courage to tell a man why you do not lend him your money.

Have the courage to cut the most agreeable acquaintance you have, when you are convinced that he lacks principle. "A friend should bear a friend's infirmities," but not his vices.

Have the courage to show that you respect honesty, by whomsoever exhibited.

Have the courage to wear old clothes until you pay for your new ones.

Sometime.

It is a sweet, sweet song warbled to and fro among the topmost boughs of the heart, and filling the whole air with such joy and gladness as the songs of the birds do when the summer morning comes out of darkness, and day is born on the mountains. We have all possessions in the future, which we call "sometime." Beautiful flowers and singing birds are there, only our hands seldom grasp the one, or our ears hear the other. But oh, reader, be of good cheer. For all the good there is a golden "sometime" when the hills and valleys of time are all passed; when the wear and fever, the disappointment and sorrow of life are over; then there is the place and rest appointed of God. Oh, homestead! over whose roof fall no shadows or even clouds, and over the threshold the voice of sorrow is never heard; built upon the eternal hills, and standing with the spires and pinnacles of celestial beauty among the palm trees of the city on high, those who love God shall rest under thy shadows, where is no more sorrow nor pain, nor sound of weeping "sometime." *George D. Prentice.*

The Tubular Lantern.

A most excellent lantern, and one most highly to be recommended, would be that one which, while being convenient to handle, will give a pure, powerful light, emit no offensive or hurtful gas, will not smoke the globe, cannot be made to heat, take fire, or explode, can be easily trimmed and lighted, has no delicate or complicated parts to get out of order, burns the cheapest, most readily obtained and most effective oil, and burns it most economically, and is equally good

indoors and out, at rest and in motion, in calm and in wind.

The manufacturers of the lantern here illustrated claim that their device comes the nearest of any made to satisfying the above demands. They use it for kerosene, because this article is cheaper and much more convenient than oil. The objections to kerosene lanterns are that they are liable to heat, often take fire, sometimes explode, and do not perfectly consume the oil, thus not only wasting that material but also smoking and emitting noxious gases, and giving a poor light. They claim, however, to have obviated these objections by a simple method,—by admitting a regular current of air in and around the burner, producing perfect combustion and a steady and brilliant light, and at the same time keeping the parts cool.

The illustration will give a fair idea of the lantern. At a short distance above the globe is a sort of bell with a pipe above it connecting by two sides pipes with an air chamber, which is placed below and leads into the burner. There is a constant current of air through these pipes and thus the necessary oxygen is supplied through the burner into the flame. The globe rests on a plate, perforated to admit the air, and can be readily placed or removed. By means of the currents through the pipes and the perforated plate, not only is perfect combustion secured but, as we are told, the top of the lantern, globe, burner and oil below are all kept cool, thus obviating the damage of explosion. Moreover, the currents cause the flame to be steady in the wind.

If the wick be turned up very high, in order to get the largest blaze possible, instead of heating and overburning, it will (beyond a certain limit) go out. The same effect will result on overturning the lantern. The only precaution to be observed is to keep the air chamber clear, that the current may not be impeded or stopped.

The lantern is light but strong and dura-

ble, having but few parts liable to get out of order. The simplest way for each person to satisfy himself whether the manufacturer's claims are good, is to go into a store and subject the lantern to a series of experiments; see how bright and clear the flame is, try to blow out the flame, turn the lantern over on its side, place the finger on the cone of the burner to see how hot it may be. Such tests as these will be the most satisfactory of any to the purchaser, as to the illuminating power, freedom from smoke, use in the wind, and safety of the lantern.

The Tubular Lantern can be seen at various places in this city, and is made by the Chicago Manufacturing Company, 43 and 45, Franklin street, Chicago, Ill. They are meeting with a ready sale, wherever introduced, and we are assured that they give the best of satisfaction.

FIRST & PRYBIL'S IMPROVED BAND-SAW.

Improved Band-Saw Machine.

The work of scroll sawing has been revolutionized within the past five or six years by the band (or endless belt) saw. Nearly all "outside" work in first-class shops is now done on these machines. It is calculated that fully three times the amount of work, in a given time, can be done on one of these machines, as on the most improved "jig-saw." American mechanics and wood-workers were prejudiced against their adoption for several years, alleging their impracticability on account of the supposed great expense of running, by breakage of saws. Their adoption by the French wood-workers, however, continued to increase very rapidly, until they became a common tool in nearly all first-class shops. A further investigation by American machinery manufacturers, elicited the fact that the difficulty was not in the machines but in the saws. This was a natural result, as our labor-saving machinery is universally better built, of more approved construction, and not nearly as clumsy as that of foreign manufacture. The trial of the French saw-blade on our American machines proved most satisfactory. The great trouble of breakage of saws was overcome, and it was found that with French-tempered blades (and none others

are now used, for the French are experts in the manufacture and tempering of steel), the belt-saw, with ordinary care, would wear out before breaking.

The demand for the American band-saw machine became general at once. Several patents were immediately taken out, and the machines put into the market. Among the more prominent of these machines are those built by First & Prybil, of New York. We illustrate one of their patterns in this issue of our paper. This machine is built of all iron and steel, except the table, which is black walnut and oak, glued up. The band wheels are 38 inches in diameter, covered with gutta percha, and are given such a speed that the endless saw travels about 3,500 feet a minute. As the upper wheel rests on a heavy rubber spring, and is raised or lowered by the hand-screw at will, a uniform tension is

given to the blade to suit different widths; and ample play is given by the spring and rubber band for contraction or expansion of the saw. Blades from one-eighth to two inches in width may be used, and sawing done to 13 inches in thickness. The patentees say:—"No saw will break except by accident or gross carelessness; certainly not more than from two to four per year—a fact which can be proved by a large number of references. The work is cut smooth, the saw being retained by an improved guard. In case a saw should break, it can be joined again by any one in about ten minutes time at a cost of five cents. We give full instructions for it to all who buy machines, so they cannot fail to make a good joint." A brazing apparatus goes with each machine. The upper wheel may be lowered to such an extent that a foot and a half of the blade may be used up in brazing, and it still do as good service as when first put on.

One hundred of these machines are now running in New York City alone, and about as many more in other parts of the country, including several in San Francisco.

Parties interested in their purchase are referred to Messrs. Berry & Place, the agents in this city of the manufacturers, who keep the different sizes on exhibition at their machinery ware-rooms, 112 and 114 California street, and who doubtless will be pleased to give any further information required.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper, or blank slip, WITHOUT the name and residence of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

SALT LAKE CITY.—Chas. Reticker is agent in Salt Lake City and vicinity for the SCIENTIFIC PRESS and PACIFIC RURAL PRESS.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate, Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 1c25-ly

At the age of forty or thereabouts the eyesight requires the aid of magnifying glasses. Muller's Brazilian spectacles are acknowledged to be the best in use.

1000 Farms

In Los Angeles County,

For Cotton, Wheat, Corn, Grapes, Oranges, etc. The "Abel Stearns Ranch," 200 square miles in sections, quarter sections, etc., on Government system of survey, forming blocks one mile square, with road on each side, fronting on the ocean, the railroad to San Francisco, and passing through them, the unsold portions subdivided, for sale on long credit, or rent. The famous Anaheim is on this tract. For Maps, Circulars, etc., apply to E. F. NORTHAM, 432 Montgomery st., San Francisco, or TIMO. LYNCH, at Anaheim and Los Angeles. 1v22-sms

FROM THE WEED Sewing Machine TO \$66. Machines—the WHOLE WORLD being judges—as they are the LAST, so also the BEST! Why? Because the WEED Machines TO work easily \$500 faster, simpler and more VARIETY. Buy the LATEST always. Call and see S. E. Root, 329 Kearns St. S. F., Ast.

The PAIN KILLER is by universal consent allowed to have won for itself a reputation unsurpassed in the history of medical preparations. Its instantaneous effect in the eradication and extinction of Pain in all its various forms incident to the human family, and the unsolicited written and verbal testimony of the masses in its favor, have been and are its own best advertisements. The ingredients of the PAIN KILLER being purely Vegetable, render it a perfectly safe and efficacious remedy taken internally, as well as for external applications, when used according to directions. The stain upon linen from its use is readily removed by washing with alcohol. This Medicine, justly celebrated for the cure of so many of the afflictions incident to the human family, has now been before the public over THIRTY YEARS, and has found its way into almost every corner of the world; and wherever it has been used, the same opinion is expressed of its medicinal properties. In any attack, where prompt action upon the system is required, the Pain Killer is invaluable. Its almost instantaneous effect in Relieving Pain is truly wonderful; and when used according to directions, is true to its name, a PAIN KILLER. 1c4-1m

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Scientific Press and the Pacific Rural Press, San Francisco.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE Ransom patents, the most perfect SANDSTONE, specimens of which may be seen in the examination of Dr. Stone's Church, now in course of erection, at the corner of Post and Mason streets. For architectural, ornamental and mechanical purposes, this stone surpasses all natural stone of its class.

GARDENSTONES from this factory, which we make of any desired size, may be seen at many of the great mechanical shops in this city, where they are held in high esteem.

The factory is now turning out Architectural Stone, Cemetery Stone, Grindstones, Garden Ornaments, in the way of Vases, Fountains, etc. The nature of the art admits of our moulding the stone in any desirable form, and enables us to compete successfully with all natural stone wrought by hand. In England, where the stone has been manufactured largely for the past fifteen years, it is considered, for durability and strength, to surpass the best English Sandstone. The British Government employs it largely in its public buildings, both at home and in its Colonies; and as we have secured the services of MR. ERNEST L. RANSOM, late Superintendent of the home works at Greenwich, England, we are turning out stone fully equal to the English standard.

For particulars, apply at the Factory, corner Turk and Larkin streets. mal8-tf.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use.
Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this
machine. The following are some of its many advantages, viz: The comparatively little power
required to run it; the small wear of metal in comparison with other grinders; the large amount
of work that may be accomplished in a given time, being about three times the amount usually
performed in ordinary pans; the continuous working process, whereby the labor of handling the
ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all
the particles of ore are brought in contact with amalgamating surfaces, and are discharged as
soon as ground to the required degree of fineness, thus saving an unnecessary waste of power
and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly
sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best
condition for roasting. The Hesse machines are successfully working in several important
quartz mills and sulphuret works in this State. For further particulars send for Circular, or ap-

THE WILSON Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut Street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

Commission,
AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of
75 PER CENT OF OIL.

They are composed of a transparent Glass Cap, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by, four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed **NATHAN & DREYFUS, New York, Jan. 1st., 1871.**

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of this Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus

We warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK OR FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages.

FIRST.—Nothing but clean oil or tallow is admitted into the Cylinder; no time or sediment of any kind.

SECOND.—Its great economy of both tallow and fuel.

THIRD.—It is self-acting, and supplies the lubricating material only while the Engine is in motion.

FOURTH.—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this cup, by its peculiar action, delivers the lubricant

in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

The above Goods are Sold at Factory Rates.

STEAM JET PUMP.

Blackslee & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or starting parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

No infection guaranteed or the money refunded.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be made, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition. ma4-2tam

Double Saw Mill.

The Lane and Bodley saw mill certainly appears to combine several improvements of detail and convenience which would render it a most desirable machine for its purpose. We present this week an illustration of the standard double saw mill, which, with the description, will give a fair idea of the construction, and enable the reader to form a general judgment as to its merits.

A full description is not requisite, but some of the important peculiarities may be spoken of. One of these prominent points is the friction feed. In most saw mills of the kind, the necessity of having two mo-

To obtain the backward motion, the small leather feed pulley is raised up and an idle pulley is brought to bear equally upon the backing pulley on the saw mandrel and upon the large pulley on the pinion shaft, thus producing a retrograde motion of about 400 feet per minute. As a degree of slip occurs while the carriage is attaining this velocity, there is no fear of undue straining or breakage, as would be the case with unyielding gearing, and the rapid gidding back saves much time. The carriage can be instantly arrested at any point by raising the idle pulley and bringing the feed pulley momentarily into operation, this acting as a powerful brake. The same lever commands both feed and

same direction, and a steady parallel advancement of the knees. The reduction of speed incident to the use of the screw renders the motion of the ratchet wheel rapid in comparison with the advancement of the knees, so that teeth of a heavy pitch represent small fractions upon the head block. The knees may be advanced independently by their respective hand wheels, or simultaneously by the hand lever. By changing a stop pin, placed in one of the holes drilled through the bar near the head lever, the sawyer may vary the thickness of the lumber without loss of time and with certainty. The whole arrangement of the head blocks is such that they will set correctly for boards or for timber, regardless

the details, and are warranted to work well if properly erected and operated. The circular saws are also warranted. By application to the manufacturers, Messrs. Lane and Bodley, John and Wator streets, Cincinnati, any further information, price lists, etc., may be obtained.

UNIVERSITY OF CALIFORNIA.—At the special meeting of the Regents, this week, President Durant reported that there was a fifth class organized at Stockton, under the charge of B. H. Weston, A. M.; and that he had received letters from teachers in San José, Santa Cruz and Grass Valley, requesting that a fifth class be organized at each of these places. He recommended

THE LANE & BODLEY STANDARD DOUBLE SAWMILL.

tions to the carriage,—a slow, variable, forward motion for sawing, and a quick retrograde motion,—gives rise to the use of considerable complication of machinery, with the attendant disadvantages. In the mill under consideration, the use of a friction feed simplifies the machine and obviates many of these difficulties. No backing belt is required. The feed belt drives a feed shaft on which is a small pulley of leather. This is brought, by means of a lever, to bear on a large iron pulley on the pinion shaft (the pinion working into a rack on the under side of the carriage), when a forward motion of the carriage is desired, and thus the carriage is moved. By relaxing the pressure the motion can be reduced when necessary, as when the saw is passing through a knot, and by restoring it the full velocity can be regained. Cone or differential pulleys are used, so that, by removing the belt from one to another, different feeds may be had.

go-back, and is located outside of the carriage, so that the sawyer stands in the proper position to set the head blocks himself, and thus the labor of one or two men (as the case may be) is saved over the number required by the usual arrangement of circular saw mills.

The new simultaneous and independent wrought-iron head blocks form another important feature. The base is a wrought-iron beam of an I section, on the side of which is a double-thread screw of quick pitch, passing through a nut eight inches long on the knee. On the end of the screw is a pinion working into a spur wheel. This wheel also forms the ratchet and crank in one piece. A bar of iron the length of the carriage lies upon bearings at the side of it, and receives a reciprocating motion from the head lever. Connected by a bolt to this bar are two pawls for each head block; the one operating at the top, the other at the bottom, produces a constant rotary motion of the screw in the

of length or distance; a springing log cannot draw forward nor force back the knee; they can be easily removed, are very strong, and permit the sawyer to advance either one, or both, of the ends of the log at pleasure.

The dog, as shown, is automatic, operated by a hand wheel, and rotates horizontally, so that it can be applied in any desired position with ease, security, and rapidity.

The principal object of the upper saw is to have capacity enough to slash and square as large a log as the lower saw can afterwards cut up, which is thus more economically obtained than to add twenty-four or thirty inches to the diameter of the lower saw. In extreme cases both saws can be used throughout the whole log. One saw is placed a little behind the other, so that the cuts reach each other without the saws touching.

There are other points and claims which we have not space to give. The mills are well and substantially constructed in all

that the Superintendent of Public Instruction and Professor Tait give the necessary information, and assist in organizing the classes.

TURTLES.—A new business has opened for San Diego, says the *Union* of that city. Gordon, Stewart & Co. shipped to San Francisco by the last steamer sixty large soft shell turtles from Lower California. Several men are engaged in the business on the lower coast, and regular shipments will be made hereafter.

RAILROADS.—Since the war, Alabama has built 296 miles of railroad, Georgia 231, Tennessee 155, Texas 132, North Carolina 146, South Carolina 128, Virginia 104, Mississippi 128, Arkansas 90, and Florida 44.

On St. Patrick's Day, this city appeared to be half Irish; last Wednesday, it seemed three-quarters German.

MECHANICAL PROGRESS.

THE IRON PROBLEM.—The following is an extract from an article in London *Engineering*:—The percentage of sulphur and phosphorus in the pig iron still limits the applicability of the Bessemer process. "Invention after invention has been made for the purpose of effecting a purification in the Bessemer converter, but the results recorded have been total failures. There is one exception, however, with regard to one of the most recent patents taken out in this country, viz., Mr. Sherman's process of purifying iron by means of iodine. Experiments have been made which afford conclusive evidence that the desired effect can be produced under favorable conditions, and it remains now to be found out how these conditions can be brought under the control of the practical metallurgist, so as to insure a similar favorable result at all times in ordinary commercial practice. There is another patent which has the same purpose in view, taken out by Mr. James Henderson, of New York. The substance employed is fluorine. It is used in the form of fluor-spar for fettling the converter or furnace, and it is also combined with titanium or titaniferous ore. The action of fluor-spar upon iron containing phosphorus has been tried in the laboratory by eminent chemists, but the result was always negative, and therefore little hope is now entertained with regard to this patent. There remains one important field of research open as yet, viz., the production of steel direct from the ore. This at present is almost monopolized by Mr. C. W. Siemens. The difficulties which beset the road to progress in this direction are so great, and all the experiments require so great an amount of scientific knowledge and perseverance, that the problem seems to have been left in Mr. Siemens' hands by universal consent."

ANOTHER ELASTIC WHEEL.—*Engineering* for Feb. 17th describes an elastic wheel for traction engines, designed to do away with the costly rubber tires. We quote: "The wheel consists of a cast-iron nave formed in two parts, with a number of radiating sockets, each part of the nave having one-half of the sockets formed upon it, so that when they are bolted together the sockets shall be complete. Within the sockets are short tubes, the ends of which extend as far as the fixed periphery of the wheel, the spaces between the tubes being filled up to strengthen the construction. Within each of these tubes is placed a solid plunger, with a hemispherical outer end, the inner end being flat, and abutting against spiral springs placed within the tube; a pin passes through each of the plungers, and the ends play up and down in slots cut in the tube. The ends of the plungers are provided with an adjustable foot, which has, within moderate limits, a universal motion, and is kept in place by a pin passing through a double-coned hole in the end of the plunger. The feet are all linked together, sufficient play being left in the bolt-holes of the links to permit the feet to adjust themselves and take a fair bearing. By this arrangement it is expected that the sensitive sole plates of the wheel should adjust themselves exactly to the contour of the road, form as perfect springs as do the rubber tyres, and regulate the amount of bearing surface according to circumstances."

NEW SIGNAL LIGHT FOR RAILWAY TRAINS.—We clip the following description from the Philadelphia correspondence of the *Iron Age*, March 2d:—"In the center of the roof of the rear car, over the rear axle, is placed a square lantern, with alternate panes of red and white glass. This lantern is connected by a shaft with the axle, so that eight revolutions of the axle produces one of the lantern. When the car stops the lantern of course ceases to move. Upon each side of the main lantern are two others, also connected with the axle in such a way that when the train is moving forward a solid red light is shown, and when backward a solid green light. The engineer of a train approaching in the rear can thus tell by these lights whether the train is moving or at a stand, and, if moving, in which direction."

UTILIZING TIN WASTE.—The *Iron Age* says:—"An American inventor has, we are informed, deposited at the General Land Office, at Washington, specimens of pig tin, bar iron and tin salts for chemical and manufacturing uses, reclaimed wholly from otherwise useless scraps of tin plate."

EFFECT OF COLD ON IRON AND STEEL.

In our issue of March 4th we alluded to the series of papers read before the Manchester Society upon this subject, in which the weight of evidence was in favor of the conclusion that reduction of temperature increased rather than diminished the strength of iron and steel. *Engineering*, in reviewing the subject, remarks:—"Practice says, 'Iron and steel do break more frequently when exposed to cold,' while theory, arguing chiefly from the results of experiments on tensile strength made by men of science maintains 'that cold does not affect the strength of iron or steel.' So far there is a direct contradiction; but we know that the term 'strength' is often used in very different senses. * * * There can be little doubt as to the effect of cold in diminishing the resistance to concussion and impact of iron such as is ordinarily employed in the manufacture of rails, and particularly of that in which phosphorus is present to any considerable extent. Steel, on the other hand, appears to be less affected in the manner just mentioned than iron, and it is daily gaining ground as a substitute for iron in cold climates. As to the effect of cold on the tensile strength of steel and iron, we fully agree with the results of experiments, such as those made by M. Styffe and others, which show that the power of these materials to sustain dead weight is rather increased than diminished by cold; but it is difficult to establish any definite relation between tensile strength and resistance to concussion, and more particularly to the effect of numerous small vibrations."

STEAM PLOWING.—At a late meeting of the N. Y. Society of Practical Engineering, Wm. C. Oastler read a paper upon this subject, in which he takes the ground that "direct traction" steam plowing is an *ignis fatuus* which will never be grasped; that under any conceivable circumstances fifty per cent. of the duty of the engine will be wasted, even on level fields. We quote a paragraph from the paper, as reported in the *Artisan* of March 8th: "Absence of economy in cost per acre, consequent upon loss of time in turning the plow at headland; the loss of power and consequent loss of speed at which the engine has to pass over the land; the difficulty and consequent great cost of propelling an engine over or rather through the land to be plowed without reference to its nature or condition, are difficulties inseparable from and enough to make steam-plowing by locomotive traction abortive and unsuccessful; but apart from these mechanical difficulties, there are advantages derivable from the adoption of a correct principle that are not only altogether lost and made of none effect by direct traction, but the splendid results that have followed the rope-traction system are actually turned to a disadvantage. The weight of the heavy steam engine as it passes over the land compresses not only the soil that the plow would turn over in lumps, but leaves, underneath the depth to which the plow has penetrated, a crust or "pan," where water may rest after wet weather, to the injury and oftentimes the destruction of the young plant, the roots of which require moisture, but not a soaking of wet."

AN ENGLISHMAN ON AMERICAN LOCOMOTIVES.—Mr. Brunner, of Montreal, sends to *Engineering* an article on this subject, from which we make a single brief extract: "The cast-iron wheels form another distinctive feature in American practice. The small chilled cast-iron disc wheels of their engine, tender, and car trucks answer admirably well, being cheap, strong and durable at the same time; but, as regards the driving-wheels with hollow spokes and rim, they are, after all, but a primitive contrivance as compared to the solid wrought-iron wheels now manufactured to such perfection by the leading British locomotive makers, and especially by some Belgian and French firms. To turn out a really good wrought-iron wheel, special tools and appliances, and superior manual skill, are indispensable; and it is, perhaps, the lack of these that has prevented the Americans from making an attempt in this direction."

ST. LOUIS IRON MANUFACTURE.—*Van Nostrand* for March, says: The subsidiary iron works in and near the city, are increasing almost monthly. Including the bolt and nut works with a capital of \$150,000, the various foundries, stove works, and other establishments, the capital so invested is not less than \$5,000,000, with a yearly production of \$9,000,000.

SCIENTIFIC PROGRESS.

FAUNA ARGENTINA.—W. H. Flower gives in *Nature* for Feb. 9th, a summary of the first volume of the "Annals of the Public Museum of Buenos Ayres"—the sixth number just completed, being the commencement of a new volume. This is to be a most valuable work. The field is extensive, and its present manager, Dr. Burmeister, the Director of the Museum, is a naturalist of note, formerly Professor of Zoology in the University of Halle. We quote a paragraph from the commencement of Mr. Flower's article, to indicate the importance of the work: "Few districts of the world are so rich in well preserved remains of an extinct fauna of remarkable and interesting character as the neighborhood of the city of Buenos Ayres. The immense alluvial plain of the Argentine Republic is the burial place of the Megatherium, the Mylodon, the Glyptodon, the Macrauchenia, the Toxodon, and many other strange forms of ancient life, whose bones are ever and anon restored to light by the crumbling away of the soft banks of the great rivers which flow into the estuary of the Plata. So abundant, indeed, are they that, as remarked years ago by Darwin, any line whatever drawn across the Pampas would probably cross the skeleton of some extinct animal. Collections of these fossils have at various times been sent to several European museums, and much information has been published upon the nature of the animals to which they belonged, but these observations have been generally made upon imperfect or fragmentary materials. * * * This work promises to be one of the most important contributions yet made to the knowledge of Mammalian zoology, for to this class is the publication mainly restricted. The parts already before us contain not only more complete descriptions than have hitherto been given, of many of the extinct forms mentioned above, but have also several admirable anatomical memoirs on rare or little known living forms, especially of the Cetacea which occur in the estuary of the great river Plata, and in the adjoining part of the Atlantic ocean, a field of research hitherto almost unexplored."

INSECT METAMORPHOSES.—The following is an extract from a new book reviewed in *Nature* by Alfred R. Wallace; an adaptation for English readers of M. Emile Blanchard's work on the above subject. The author is speaking of the parasitic hymenoptera: "All the parasites seek out a caterpillar, a larva, or an insect which suits their purpose, in order to lay an egg within its body. The larva which is born from this egg is nourished by the blood and fat of the victim, whose vital organs it does not touch or injure in any way; for were it to die, the parasite would come to an end also. It is only when the larva is nearly full grown, and is about to undergo its metamorphosis into a pupa, that it appears to know that the life of the victim is not likely to be of much further use. It then devours the internal organs of the unfortunate insect, and undergoes its transformation. The skin of the victim protects some of the pupae of its destroyers after all the inside has been eaten. Nearly all, if not quite all, insects are subject to the attacks of parasitic hymenoptera. Fine, smooth, and brightly colored caterpillars often have a black spot upon their skin, and this is the healed wound of the ovipositor of one of the parasites. Sooner or later the creature is sure to die, and it never reaches the stage of growth when it can lay eggs or reproduce its kind, for before this time the growing larva within destroy it, as it were, by slow consumption. Some affected caterpillars die soon, others nearly reach their full growth, and a few undergo their transformation into the chrysalis state before death. It is, therefore, not an uncommon thing for a butterfly-collector, who hopes to see a fine moth disengage itself from its pupal covering, to be disappointed by the appearance of several little parasitic Hymenoptera that had been living within the chrysalis he has been keeping."

An absolutely perfect galvanic engine, actuated by a perfect battery, would develop only about one-horse power per hour from each pound of zinc consumed in that time. Zinc is much more costly and less efficient than coal, weight for weight.

MICROSCOPIC STRUCTURE OF BASALT.

Dr. F. Zirkel, now of Leipzig, contributes to petrographical literature a small volume upon this subject, which is noticed by Arch. Geikie in *Nature* for Feb. 16th. We give a paragraph from this notice: "The second part deals with the general microscopic structure of basalt-rocks. The common notion regarding that structure has hitherto been that down to its minutest particles basalt is a crystalline rock, that its individual microscopic ingredients mutually impinge on each other, and that the difference between the structure, for example, of granite and basalt consists in little more than in the varying relative size of their component minerals. Prof. Zirkel shows that this notion, which has been founded on mere deduction and not on direct observation, must be changed. He finds that in the majority of the specimens examined by him, there exists between the most minute ingredients a more or less abundant substance, not individualised into crystals, but amorphous, acting like a cement, sometimes glassy in character, sometimes half-glassy, owing to the appearance of hair-like particles, and sometimes so as to present a confused aggregate of darker or lighter minute granules, needles, hair, and crystals. He regards it as hardly possible to doubt that this glassy base in basalt is the residuum of the original magma out of which the recognisable minerals in the rock crystallised, and that it furnishes us with a new proof of the igneous origin of basalt."

VIOLET A PRIMARY COLOR.—F. T. Mott writes *Nature*, Feb. 23d: "One more proof that violet is a primary. Place a hand prism between the eye and the sunlight so as to show the prismatic colors. Then hold a sheet of yellow glass between the prism and the light, and observe the result. The reds and yellows are scarcely altered, the greens are very greatly intensified, the blues and violets are altogether extinguished. If violet had really any red in it the yellow glass, which does not stop the red rays, would change the violet to red, or would show at least some trace of red where the violet had been. Instead of this, the violet is totally stopped out, and the space which it occupied left dark. Wherever the secondary pink appears, this is changed to red by the stopping of the violet rays. The increased strength and brilliancy of the green shows clearly also the primary character of this color. It is usually much weakened in the spectrum by mixture with the far-spreading violets; when this is removed it comes out in full splendor. I commend this little experiment to amateurs; it is simple and interesting. The same effect is produced by throwing the colored spectrum on to a white wall, and holding the yellow glass between the prism and the wall."

REDUCTION OF NITRATE OF SILVER BY CHARCOAL.—C. F. Chandler, in the *American Chemist* for March: "When solid nitrate of silver, either in crystals or sticks, is placed upon glowing charcoal, deflagration takes place, the silver being left in the metallic state, while binoxide of nitrogen and carbonic acid are evolved. The nitrate is fused by the heat of the reaction and sinks into the pores of the charcoal, and as each particle of charcoal is replaced by metallic silver, the structure of the original wood is preserved. With proper management, pieces of silver of any desired size can be prepared, showing the exact structure of the wood. A crystal of nitrate is placed on the end of a piece of charcoal, and the blowpipe flame is directed upon the coal near the crystal to start the reaction. When deflagration begins, crystal after crystal may be added. The nitrate fuses, passes down through the porous metal already reduced until it reaches the glowing coal, where it is reduced. I have prepared in this manner lumps of silver weighing an ounce or more, which exhibit most beautifully the rings of the wood."

ARTIFICIAL PRODUCTION OF ALKALOIDS. H. Schiff has succeeded in preparing artificially the alkaloid coniin. This important discovery indicates the probability of our some day being able to make quinine, morphine, and the like by synthesis. By allowing alcoholic ammonia to act at 212° F. on butyraldehyd a body is formed, which, upon combination with platinum and subsequent distillation, yields an artificial coniin that is possessed of all of the chemical and physiological properties of the native alkaloid.—*Journal of Applied Chemistry*.

CORRESPONDENCE.

Notes of Travel in Stanislaus and Calaveras Counties.

[Written for the Press.]

Knights Ferry and Vicinity.

Knights Ferry, county seat of Stanislaus county, is situated on the west bank of the Stanislaus river, in the foot-hills, 40 miles from Stockton. It contains about 800 inhabitants, and at this writing is as lively as any town in the southern mines. It contains two hotels, three saloons, five stores, three blacksmith shops, one wagon maker, one saddle and harness shop, two shoe shops, one tin shop, one livery stable, one feed stable, three law offices, two harbor shops. Fifty pupils attend the public school daily, and a private school for girls is well attended. The apportionment of the county school fund is \$6 per child (as per census of last year). This county paid into the State Treasury \$30,000 last year.

Buenavista, (nick-named *Scohegan*), situated on the opposite side of the river, has one store, one saloon, one blacksmith shop, one saddle and harness shop, one public school, and one hotel, the latter kept by S. D. Dingley, who is proprietor of 204 acres of fine grazing land, upon which Messrs. Enslens & Dingley have 1,000 head of French and Spanish Merino sheep. The stallion "Messenger," owned by W. H. Martin of Knights Ferry, was foaled in this county; sire White's Messenger, dam Williamson's "Morgan mare," is seven years old, 17½ hands high, and as fine a looking specimen of his kind as there is in the State.

One mile from Knights Ferry is a fine quarry of building stone of which the Stanislaus mills are built, the capacity of which is four run of hurr's. This structure is 44 x 41½ feet on the ground, 3½ stories high, cost \$51,000 to erect, and is run by water power, (turbine wheel). The warehouse connected is 118 x 74 feet, with capacity of storing 3,000 tons of grain. D. W. Tulloch & Co. are the proprietors.

A fine bed of mineral paint exists in the vicinity of town, and one of the best water-powers in the State. The dam of the Stanislaus mills is built of red fir timber, and cost \$6,000. A ditch on each side of the river, carrying the water at least 150 feet above the bed of the river, affords almost unlimited power to drive machinery. There is some talk of erecting woolen mills here. The foot-hills are full of sheep and wool is plentiful. This place has all the facilities of a manufacturing town undeveloped. South, south-east, and south-west, of Knights Ferry is a splendid tract of wheat land, and here may be found some of the largest farmers in the State. R. Threafall & Bro., six miles distant, have this year under cultivation some 10,000 acres,—all in wheat. The covered bridge across the Stanislaus river at this point cost \$14,000, and is a fine specimen of workmanship.

Rich Gulch District.

Rich Gulch District (Calaveras county) is situated seven miles south-west of Mokelumne Hill. The Quartz Glen mine, one mile north of Rich Gulch Flat, has been been worked to a depth of 200 feet, and a tunnel, run in on the lead 800 feet, has just been completed developing a ledge at this point (130 feet below the old works) of twelve feet average thickness. This rock is highly sulphuretted. In a two-years' run, with the use of an ordinary 10-stamp mill to crush the rock, some \$200,000 were taken out in bullion. Mr. H. Atwood is the present proprietor.

Several other apparently good mines are only partially developed for want of capital. The Oak Ridge claim has been opened to a depth of forty feet, shows a vein five feet thick, abounding in sulphurets, and I am informed prospects well. Work will be resumed upon this claim within a few weeks by Messrs. Hoey & Co., its proprietors.

The Poor Man mine, situated twelve miles south-west from Mokelumne Hill, is owned by the Lewis Bros., & Co., (two other partners). This company own 1,200 feet of one of the finest ledges (i. e., best paying) in this county. Their hoisting works, which are very complete, are run by an engine of 35-horse power, now working through a shaft (nearly vertical) 260 feet deep. At this point the ledge is 20 inches thick, and growing larger. At this

point they have opened lately 30 feet, at their 160-foot level—the ledge was well defined at three feet—in the cross-cut, 300 feet from their main shaft. The same machinery that runs their hoisting works also runs their 5-stamp mill, crushing five tons daily (24 hours). The machinery is arranged for 10-stamps, working twenty men regularly. This mine is rich enough not to be for sale. This company use seventy-five pounds of Giant Powder monthly.

The Wolverine mine runs parallel with the above mentioned, and only 100 rods distant, and is owned by the same proprietors. It is 1,000 feet long, has a shaft down 140 feet, and a tunnel in 300 feet. At this point they have a ledge four feet thick that prospects \$30 to the ton, crushing 60 tons. San Francisco parties have thoroughly prospected this mine and are about purchasing at \$35,000.

Wet Gulch mine, three-fourths of a mile south-west of the Poor Man mine, is owned by Messrs. Bandman, Nielson & Co., (of the Giant Powder Co., S. F.) This mine has been thoroughly prospected by shaft, 200 feet deep,—as deep as could be done without machinery, which will likely be put in operation soon. Miners in the vicinity inform me that the rock in this mine will pay considerably above the average.

The Buckley Quartz mine, near Railroad Flat, is owned by John Poe. Being a poor man, he has had to lease the same to get any revenue from it. The lessee, Mr. H. N. Sargent, being in a similar "boat," working with a 6-horse power engine only, will likely have to give up to some more powerful capitalists who can furnish machinery of sufficient power to work successfully. Mr. Poe claims 600 feet of this ledge, which, at a depth of 100 feet, reveals a vein four feet thick that pays \$20 per ton.

Opal mine, at or near Mokelumne Hill, is owned by a French company, which some few years ago successfully worked a very extensive mine of the above description, now lying idle, but for what reason I am not posted. The "opals" are small, but of a very fine luster, and found in abundance in a lava formation, almost on the top of the ground.

Hems in Brief.

J. P. B. Hill, of Fourth Crossing, is the agent of a new idea for a sewing machine, known as the "Wilson Improved Shuttle Machine," with some four or five improvements upon the same. The principal peculiarity is a self-feeding needle. Strength and cheapness are also claimed for the same.

Wyllie & Washburn, of San Andreas, lumber dealers, make and market here some 500,000 feet of lumber of all grades annually. They own and run a steam saw-mill of 20-horse power on O'Neill's creek, some 18 miles east from here.

Disbrow & Holmes, of Mokelumne Hill, manufacture 10,000 gallons of ale annually. This has been their exclusive business for eight years past. Their ale is spoken very highly of.

The "Elongated Paddle Wheel," for steamboats, is the title of an invention by Wm. G. Depew, of Mokelumne Hill (invented February, 1868). He claims that from the fact of its being elongated, it has more propelling surface with a driving wheel of less diameter, and consequently diminishes the power necessary to do the same work. It neither splashes nor lifts water; the paddles revolve upon endless chains. It has the appearance of a very useful invention.

Vineyards—Insects.

Charles Daclin is cultivating some six acres of a vineyard, one and three-quarters miles distant from Chili Gulch. By purchasing some grapes, in connection with what he raises, he manufactures 1,500 gallons of wine annually. While on a visit to this graperly, a few weeks since, Mr. D. showed me a peculiar insect, that he for the first time, had ever seen himself that day. He took it from the root of an apparently very healthy vine, noticing it accidentally while pruning. He claims to have had more or less to do with vines for many years, but says he never saw the like of this before. It is about one-eighth of

an inch thick, and three-fourths of an inch long, has a small white head with two boring horns. Its legs and body otherwise resemble a scorpion on a small scale. He fears it will be very destructive. What is it? [Send us on a specimen preserved in alcohol, for determination.—Eds.]

A. Pillion (Flume House), 3 miles south of Mokelumne Hill, on the Stockton road, has a very finely fitted up vineyard of about 7 acres. He owns 160 acres. On the portion cultivated he has some 15,000 vines of different varieties, and besides what he uses for the table (he keeps public house) he makes some 2,000 gallons of wine and claret annually. Of the latter he makes a very fine article, if your correspondent is any judge.

P. Mariano, next adjoining, is cultivating about 6 acres of vines and making 1,000 gallons of wine annually.

Calaveras County Hospital.

This institution, situated at San Andreas, now bids fair to become a creditable concern. The building has heretofore been in a very dilapidated condition, but is now undergoing repairs which will soon be completed. Its management is under the care of Dr. E. B. Robertson, who appears to be thoroughly conversant with the direction of a hospital. During the quarter ending March 1st. 1871, there were 21 patients, of whom 5 were discharged cured and 4 died, leaving 12. Causes of death were as follows: Syphilis, 1; pneumonia, 1; Chinese leprosy, 1; consumption, 1. Natives of the whole number; United States, 9; Mexico, 3; Chili, 2; China, 3; France, 3; Scotland, 1.

Several remarkable surgical operations have been performed here successfully, of which in some future article I will speak at length. L. P. MC.

Steam Dredges for Placers—A Query.

EDS. PRESS:—Last September, an agent came to my claim and desired me to subscribe for the SCIENTIFIC PRESS. In order to get rid of him, I took the paper for six months. I now send the additional sum for the whole year. I need not say that I like the Press.

If not out of place, will you answer the following question in some issue of your paper: Have steam dredges or steam shovels ever been used in the placer mines of California? Nevada City, Montana.

[We have never heard of their use.—Eds.]

The Utah Mines.

We give on another page a list of claims in Ophir District, Utah. In this connection, we give a section of the mining country south of Salt Lake City, with a brief description, taken from a private letter written by a gentleman who has been visiting the Utah mines. The letter was not intended for publication and pretends to give only the general impressions of the writer; and the section is but a rough pen-and-ink sketch. We think, however, that both will be interesting to our readers. The writer, we may say, is possessed of very considerable knowledge and intelligence, and has much common sense. We give the substance of what he writes.

I have not been able to examine the mining districts as satisfactorily as I could wish, on account of snow storms, but have seen enough to convince me that many of the reports circulated elsewhere are, as usual, exaggerated. There are some good mines, and I have no doubt more will be developed the coming summer, as there is a large extent of mining country.

The deposits are generally very irregular—not to be called veins in a great many instances, but stockworks for the most part—in the limestone which caps the granite. Of course, with all this, the

country can and does abound in mineral wealth. But if you have only one hole in the ground, you don't know what you have at all. The best way of mining here would be for large companies to work several claims. I have not the capital to do this—not even the capital to buy a decent "hole," as the owners have very exalted ideas. I can, perhaps, give you a better idea by a rough profile of the country than by description,—looking south and taking a cross section through the three principal districts in a westerly direction, ten miles south of Salt Lake City.

Little Cottonwood Cañon is denoted by A, and the Emma mine by a. This holds galena and carbonate of lead, and is rich in silver. The Jordan river is denoted by B, and Brigham Cañon by C. The Buell mines, b, contain galena and carbonates, with iron pyrites disseminated all through the ore, and also gold and silver, but the rock is low grade. At D is what is here called "quartzite," which is really a highly silicified limestone. At e are rich chloride mines in limestone, at East Cañon, E, and F is Rush Valley. At East Cañon, singularly enough, the mines on the south side are all chloride (with some lead), but on the north, galena and carbonate, although both are in limestone.

Better Communication with Arizona.

The San Francisco Chamber of Commerce last week adopted a resolution to the effect that the mail facilities between this place and Arizona were totally inadequate, and urging the Postmaster-General to establish a semi-weekly mail. Judge Tweed and Gov. Safford, both of Arizona, addressed the Chamber concerning this matter. The subject was brought under consideration by a petition of a number of leading business firms of this city, which urges the necessity for prompt action, representing the danger that a large portion of the trade would be directed to the East, and concluded as follows:

Your petitioners also represent that the population of Central Arizona, has nearly doubled in the past two years; that the farmers now raise, from the land cultivated in that section, nearly all the grain required by the Government for the use of the army cavalry and for local consumption; that the rich mining interests are being rapidly developed; that the ores from the Vulture mine are worked by a forty-stamp mill, crushing about 65 tons per day, and yielding yearly over half a million dollars in bullion; that the Big Bug mill is now in successful operation, working the ores from the Eugenia lode, and doing well; that the new placer mines lately discovered will furnish employment to a large number of miners, and that the recent discovery of very rich silver ores in the Bradshaw District will soon bring large numbers of miners to that locality.

Within the past year about three hundred farmers have located lands for ranches on Salt River, and in the month of January last about seventy locations were registered in the Land Office at Prescott, and as soon as the farmers can secure the crop now planted, there will be about three hundred more entries made in that land office. This branch of industry will be greatly increased this year, as the lands are rich, and plenty of water for irrigating purposes at hand.

We are advised upon authority we deem reliable that the mail matter now sent through this route averages fully five hundred pounds per week, and that the increased travel cannot now be accommodated by one stage per week.

PETROLEUM DEPOSITS are reported, by a Santa Cruz telegram, to have been lately discovered in the Soquel Augmentation Rancho, near the headwaters of the west branch of Soquel creek. The discovery was made by a party of hunters in observing the sickening effects produced by the waters of a spring from which they drank. A company has been formed for the purpose of working the deposits.

RECLAIMING TULE LAND.—The reclamation project in Yolo and Colusa counties, described and illustrated in the PRESS of Jan. 7, was brought to a successful termination on the 11th inst. The contract for the work has been successfully carried through, under the management of Charles F. Reed, Engineer and Superintendent. The labor of six hundred men has been required since October last, in the prosecution of this important undertaking, whereby 72,000 acres of land, heretofore useless, are now cultivatable.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

THE TARSHISH.—*Chronicle*, March 11th: A drift is being run from the face of the lower tunnel to the deposit of rich ore recently struck in the 150-foot level. The concentrator is in daily operation, and Supt. Schwerien has several tons of rich sulphurets washed from the soft ore so abundant in this claim. These will assay \$1,200 to \$3,000 per ton.

GLOBE.—This mill started up yesterday, everything working satisfactory. The furnace will be started on Monday.

EXCHEQUER.—*Miner*, March 11th: This Co., whose mill is on Silver Creek, and mine at the head of Indian Creek, has in contemplation the conversion of the reverberatory furnaces now at the mill into either a Stetefeldt or a Whelpley & Storer.

AMADOR COUNTY.

GOOD NEWS.—*Ledger*, March 11th: Water came through the Volcano ditch, on the north side of that town, last Wednesday, for the first time this winter.

ANOTHER MINE SOLD.—We learn that Jos. Morgan, of the Oneida Mine, has purchased the Mahoney mine at Sutter Creek, and work will soon be commenced.

PLYMOUTH.—Cor. of same: The "Never Sweat" is being worked by Dr. Mayon and Mr. Wilson of Drytown. I learn that from a crushing of 400 tons of rock they realized \$3,700. Their shaft is down 130 feet, with a ledge 12 feet wide. They have a good ten-stamp mill, and everything in fine working order. I learn that the "Old Plymouth" will soon start up again. This shaft is down 500 feet, with ore for a forty stamp mill.

BUTTE COUNTY.

CHEROKEE.—*Chico Enterprise*, March 18: The Spring Valley Canal Co. are running two full heads of water. They have not yet cleaned up, but occasional trials demonstrate the richness of the dirt being washed. This company is making every preparation for the extension of their ditch. At present those mines depending upon reservoirs, are at a stand still, there being no water. The Cherokee Co. have made every arrangement for the bringing of water by means of iron pipe from Butte Creek the coming season.

CALAVERAS COUNTY.

WHISKY SLIDE MINE.—*Chronicle*, March 18th: We learn that Hardigan & Co., who for some time have been running a tunnel to intersect the lead, have finally accomplished their object. The tunnel is 330 feet in length, and cuts the lead at the depth of 100 feet. At that point the lode shows seven feet wide, the rock averaging \$22 per ton.

STRUCK IT.—Horchner & Co., of the Progress mine at Mosquito, have struck rich rock. They have out a large quantity which they intend crushing in the old Vance mill.

GOOD CLAIM.—Hatch & Butterfield, proprietors of a hydraulic claim between Whisky Slide and Mill Valley, recently cleaned up \$1,000, the result of the labor of four men for two weeks.

PALOMO ROCK is paying handsomely. \$10,000 is set as the lowest limit for the next clean up.

RAILROAD FLAT.—Cor. of same: The new mill by W. V. Clark has all the modern improvements. The battery has eight 500-lb stamps. It is crushing one ton for each stamp every 24 hours.

INYO COUNTY.

CERRO GORDO.—The *Carson Register* of 17th notes arrival there of E. Eddy. He says that for some time past men have been arriving at the rate of from 10 to 15 daily. Several heavy mining sales have recently been effected, and the prospects are brighter than those of any other camp this side the Sierra Nevada range. Mr. Eddy and his two partners have just sold to Messrs. Belshaw & Beaudry the San Felipe mine for \$41,000, and four weeks since White & Williams sold their Buena Vista Tunnel mine for \$25,000.

We are informed that Messrs. White, Jackson & Co., the successful competitors for the constructing of the ditch from Owen's River to the Eclipse mill site, have commenced operations.

MARIPOSA COUNTY.

GOING AHEAD.—*Gazette*, March 17th: Stephens & Lambeth, who contracted for the purchase of the Whitlock and Sherlock Co.'s property, have set to work vigorously upon mines and mill with a force of hands and teams.

NEVADA COUNTY.

EUREKA TOWNSHIP.—*Transcript*, March 15th: At Moore's Flat, Knotwell & Atwater have put up a new rig on their claims and have two of Fisher's Hydraulic Chiefs. A few days ago their reservoir was broken by a cave, and it will take ten days to repair damages. The Illinois are putting a new apparatus on their claim, and raising a shaft. The Eagle have discharged two blasts, breaking up the ground, and will commence washing in a few days. Woolsey's Flat has a prospect of being as lively as it was years ago. Four companies are working. The Blue Bank ground was unworked for years until last season, and the owners have a splendid prospect. They run 650 inches of water, and are making a good thing. The Boston Consolidated Co., (Haggarty & Co.), are running a tunnel and stripping the surface. The XIX ground, owned by Marks & Co., is being washed. The banks are 200 feet high and the ground good. Allenburg & Co. are running a hed rock tunnel, putting in a new rig for hydraulic, and will be ready for work in a month. At Orleans Flat prospecting is encouraging. At Eureka gravel prospecting is being done and the quartz interests look promising. The Erie is turning out lots of gold.

CEMENT HILL CO.—Roffe & Stranahan, in their claims newly fitted up for hydraulic, prospected some gravel on the bottom, which yielded a bit to a shovel.

WATER.—Same of 17th: The South Yuba Canal has demand for 1,800 inches per day, or more than all the ditches can convey. The entire sale of water by the Company last week was 31,000 inches, and the largest ever made was only 52,000. Of the amount now supplied by the Co., 2,000 inches are running to Dutch Flat, 1,300 in the Snow Mountain ditch and 400 to Blue Tent in the ridge ditch.

QUARTZ AT EUREKA.—The Black & Young mine is worked, and the mill is in operation. The ledge is of good size and the rock easily taken out. The Erie is paying exceedingly well. The Birchville will be started up this Spring for the purpose of prospecting. The owners of the Jim mine talk of starting up.

OMEGA.—Same of 19th: Nine companies are washing, but the supply of water is not sufficient to run continually. Several run at night and suspend during the day.

BLUE TENT.—All the companies have been at work, but the water was cut off yesterday, as is supposed by some accident to the ditch. The miners expect to have fully as good a season as last year.

BALTIC.—*Grass Valley Union*, March 16th: The company made their initial clean-up yesterday, after a run of two weeks, and took up \$1,200.

RANDOLPH FLAT.—Same of 17th: Webster & Co's claims clean up daily \$160 from the first two boxes of their flume. The first company in the region, the "Rough and Ready," in the latter part of '49, used to realize \$300 to \$600 per day for three men—with rockers. One of the Randolph Co. went home in February, '50 with \$15,000 for his share, after 4½ months' work. These diggings are supposed to be a "break out" from the great Alta Lead, now being prospected by several companies.

THE ALTA HILL MINES.—The Altoona Co's steam machinery will start up Wednesday. The shaft is down 214 feet, a sump of ten feet being in bed rock. The depth to bed rock is 204 feet, the lowest yet struck in Alta Hill, and the indications are, therefore, that the old river bed is under the Altoona's location. In the bottom of the shaft a bed of gravel was struck two feet thick, eight feet long and four feet wide, which gave something over \$49, and enough of the gravel was taken from the bottom of the shaft to yield \$5 more. The prospects are very flattering. The Co. has a surplus in the treasury. Altoona Co. No. 1, will start work on their shaft soon. Altoona No. 2 will await the developments made by the first. Hope Co. takes out more than enough to pay expenses, dead work underground and all. The McSorley Co. is piping at a rich bank of gravel. Picayune Co. is running a hed-rock tunnel.

PLACER COUNTY.

A BIG MINE.—*Herald*, March 18th: The St. Patrick has about finished a clean up of 194½ tons of rock, crushed at the Empire Mill, last evening, which yielded some \$16,000 or \$80 per ton. This rock has been taken out as the Co. went down at a depth of 200 feet where the ledge is fully three feet thick.

STARTING TO WORK.—Mr. Slosson the Sup. has again commenced work on the Minerica mine, west of here. He has got the shaft pumped dry and is at work in the bottom.

SHIPLEY.—Baptist Stinger has the first western extension on this ledge, of 1,000 feet. He has his main shaft down seventy feet, where he finds the ledge five feet thick, and growing thicker and richer. He had thirty-eight tons of quartz milled at the Shipley mill last week which yielded \$1,140, or \$30 per ton. He is now drifting on this monster ledge at the above depth and taking out rock that he believes will pay \$50 to the ton.

SAN BERNARDINO COUNTY.

RICH ORE.—*Guardian*, March 11th: A wagon load of ore from the "Hard Nut" Mine, Clark District, arrived in town a few days ago for shipment to San Francisco. This ore we are informed is exceedingly rich, assaying from \$6,000 to \$8,000, a ton.

SIERRA COUNTY.

ITEMS.—*Messenger* March 18th: The Keystone resumed operations this week. The claims on Badger Hill, are being hydraulized.

SISKIYOU COUNTY.

ORO FINO.—*Yreka Union*, March 15th: We learn that the miners have an abundance of water at present.

Nevada.

COPE DISTRICT.

ITEMS.—*Avalanche*, March 11th: Norton's mill has commenced on Excelsior rock. The Robert Emmet Co. are working two shifts and getting out fine ore. The Argenta Co's shaft is down 190 feet. The stamps for Vance's mill are on the road from Elko.

SMELTING FURNACE.—Mr. Robbins started up his smelting furnace on Wednesday, on mixed ore, but after running 22 hours, the lining burned out. During the 22 hours 69 bars of metal were produced, averaging 110 pounds each. Work will be resumed as soon as repairs are made.

ELY DISTRICT.

MILLS.—*Record*, March 12th: All the mills at Bullionville are kept busy. There is room for more on custom work. Raymond Brothers' 5-stamper never stops. Raymond & Ely Co's 10-stamper runs steadily. The Chicago mill has been running 12 days. All the machinery works well and they are turning out bullion at a rapid rate. The Meadow Valley Co's mill is constantly running on ore from its own mines.

BULLION.—The shipments per Wells, Fargo & Co. from February 21st to March 9th amount to \$78,504.14.

Same of 16th gives the figures of the next following week, to March 15th, at \$23,861.46.

CRUDE BULLION.—Nine hundred pounds was received by Cabill, on Wednesday, from the Chicago mill, for melting and assaying. This is the first lot sent to Pioche from that mill, and is worth \$14,000—a fair turn out for 13 days' work.

EUREKA DISTRICT.

GOOD HOPE.—*Sentinel*, March 18th: The mine is looking well at 40 feet deep. Heynes is in possession, and is putting the shaft down rapidly in good ore.

LUPITA.—The broken ground has been passed, and what seems to be the main body of ore is fairly opened, with a good breast from which four or five men can easily take out 15 to 20 tons of ore daily.

RICHMOND.—A large body of ore has been discovered that will render it easy for eight men to take out enough to keep the furnace running. The new furnace will be running in a few days.

RE-DISCOVERY.—Some time since Paige & Corwin gave up the working of their mine at Secret Cañon, on account of the depth and the thinness of the ore. Commencing to drift 30 feet from the surface, after running a few feet they struck ore, and following it they have now as good as ever.

BULLION.—From 1st to 15th March were shipped by the Eureka Cons. Co. 200 tons of bullion, averaging in value \$360, and there are now about 30 tons awaiting shipment. The Buttercup, in the same time, has shipped 30 tons, and has a small amount on hand. The furnaces are running constantly. The Tilton works have been running for 10 days and are piling up the bullion, having about 40 tons for shipment.

REESE RIVER.

The *Reveille* says the business men of Austin have purchased the Knickerbocker mill, near Ione, and will move it at once to their own city. A site has been secured, and the purchase money for the mill has been paid. A joint stock company is now to be formed to pay the expense of moving, of adding the furnace necessary, and of commencing operations. All classes are appealed to, to aid the enterprise and put money in their purses by taking stock.

RICH STRIKE AT BELMONT.—Same of

17th: We have received a letter which informs us that a very rich strike has been made in the El Dorado South mine. Three hundred and forty feet below the surface the entire lode is permeated with dark red chloride and black sulphurets of silver of exceeding richness. Assays yield as follows: chloride, \$801.25; sulphurets, \$2,175.64 per ton.

WASHOE.

CHOLLAR-POTOSI.—*Enterprise*, March 19: Daily yield 280 tons, mostly from the Belvidere section, which bids fair to hold out for many months. Little blasting is done, and no assorting. The regular hullion yield is immense.

CROWN POINT.—The newly developed ore body in the lower levels south of the shaft proves to be more and more extensive, and improving in quality. The width is perhaps 25 feet on the average. The mine is yielding over 100 tons of ore per day at present.

YELLOW JACKET.—Daily yield 185 tons, milling \$35 per ton on the average, principally from the 700, 800, 900 and 1,000-foot levels.

HALE AND NORCROSS.—Daily yield 230 tons, principally from the eighth level, with forty tons from the 175-foot level, and seven or eight from the 535-foot. The general appearance of the mine is encouraging. Receipts for February \$121,954.

BELCHER.—The winze below the 420-foot level is down 60 feet below the track floor and the bottom is in quartz, assaying \$20 per ton. A cross-cut west is being run in the hope of finding something better. The west drift from the 420-foot level is in favorable looking quartz.

SUCCOR.—This mine has of late come into more prominence, owing to increased product of good ore and better bullion yield. The amount of good pay ore is enormous. The White ledge in this mine is a most important discovery, and experts declare it to be a portion of the old Comstock.

IMPERIAL.—The cross-cut from the south drift into the Holmes ground, belonging to the company, shows good-looking quartz with spots of metal.

SAVAGE.—Daily yield 100 tons of average assay value \$30. A great deal of prospecting is being carried forward. Receipts for February, \$95,600.

VIRGINIA CONSOLIDATED.—The cross-cut west in the old California ground is in quartz and porphyry. Prospects are favorable.

SIERRA NEVADA.—Both mills are kept steadily running on good ore from the ledge and surface gravel deposits.

GOULD AND CURRY.—The ore and bullion yield of this mine is limited at present, but a vast amount of prospecting is being done.

KENTUCK.—The repairs to the shaft being about concluded, the production of ore will be commenced forthwith.

SUTRO TUNNEL.—Yesterday this tunnel was in 1,826 feet. It is still very wet, much water flowing through it, but good progress is made.

DANEY.—The drift from the main drift is in 120 feet and good progress is made. The rock is getting softer.

OVERMAN.—This mine is yielding about the usual amount of ore. Receipts for February, \$22,000.

OPHIR.—The up-rise toward the old 9th level is still slowly progressing.

Arizona.

ITEMS.—Prescott *Miner*, March 4th: The news from all the districts is good. More rich silver ledges have been found in Bradshaw, and the excitement is increasing. Men, wagons and pack-trains are constantly leaving Prescott, and Tiger, Eclipse and other ledges cannot be purchased for less than \$100 per foot. Shafts are being sunk upon several ledges. The Big Bug mill is turning out plenty of gold. A forty or fifty-stamp mill will soon be erected. Very rich ore has been struck in the Eugenie mine. In Walker District, Mr. Pointer is cranking ore in arastras, by water power. Shelton and others are taking out ore. Judge Howard has just received a letter from the Vulture mine, which states that a piece of "rock," 14 inches long, 10 wide, and 10 thick, containing about one thousand dollars in gold, was recently found. A company was preparing to start the little mill. The 40-stamp mill was grinding away. Our placer miners have plenty of water, and are making money. Returns from Bradshaw ore sent to San Francisco, for assay, have been received here, and range from \$100 to \$5,000 per ton.

LEE & SCOTT.—The Tucson *Citizen* of 4th says of this mine, 15 miles west of town: There are eight men at work upon it. There is a shaft 150 feet deep, which has been sunk at no expense above the proceeds.

The ore has been worked enough to show that the mine would prove a choice investment for capitalists.

Colorado.

THE WILLARD PROCESS.—The Boulder News of March 15th, says this is a success. Notaway ore yielded \$58 clear of all expenses by it; it has been valueless by any other treatment. Mr. W. will soon put up a mill with 15 furnaces.

GILPIN COUNTY TREASURER.—Shipment of February, was, in coin, \$120,000, the largest monthly since November, '69. The largest amount in any one month of 1870, was that of July, \$118,700. So says the Herald.

ITEMS.—Herald, 4th: The Roderick Dhu keeps 35 stamps of the New York mill going on ore which yields from three to four ounces of gold per cord. The Fiske employs 40 stamps; Gregory Second, 30; Kansas, 30; California, 30; Burroughs, 30; Frize, 29. Nearly all the Black Hawk mills are running, and have a supply of ore on hand. The amount of quartz crushed and of gold shipped is usually large for this season of the year.

PRIZE LODE.—Chamberlain, Buck & Co. are obtaining satisfactory results. The work is all done by contract, and two cords of mill ore are raised daily, besides the first-class ore.

Idaho.

ITEMS.—Avalanche March 11th: The Cosmos mill started up again yesterday on Chariot ore. Wells, Fargo & Co. shipped this week 8 bars of bullion, valued at \$27, \$23.57. The Webfoot mill is running on Oro Fino ore, said to be yielding handsomely. It is reported that the Golden Chariot Company will build a 40-stamp mill next summer. The Morning Star mill, idle nearly three years, will be started up as soon as repairs can be made. Smythe & Co. have been working the Malaveras mine and taking out rich gold ore. Mike Hyde has increased his force on the Peck & Porter and is taking out ore in abundance. The Fairview mill will start up again on the 20th inst.

MINING WAR.—Last Sunday a party consisting of half a dozen armed men took possession of the Mahogany mine. The jumpers claim that they are bona fide owners having bonded it to L. W. Greenwell, who would neither pay the money specified nor give up the ground.

NOR BAY.—During the first 25 days of February, Golden Chariot bullion to the amount of \$100,848.21 was shipped to San Francisco.

PIONEER.—Boise News, March 11th: Col. Stevenson informs us that the ore extracted this winter from the quartz mine at Summit Flat, owned by Clarkson and Brown, is the richest he has ever seen.

SNAKE RIVER.—The miners are reported as making good wages even at this season.

Idaho.

ATLANTA.—Cor. of Statesman, March 7th: Work progressing slowly on the Lancy edge. It is now run under the name of the Stanley company. In Yuba there are two companies working, the Newton boys and Wm. Doolin. They have struck a very rich ledge. There is a streak in it from four to six inches wide that prospects from one to five dollars to the pound. This place will need a number of men in April when the placer miners commence work.

Montana.

[A portion of the following matter was in type last week, but was crowded out. Ens. Press.]

BULLION FROM FLINT CREEK.—Helena Gazette, March 6th: We saw yesterday in the window of the First National Bank, 613 pounds, or rather 8,923 60-100 ounces of silver, from the St. Louis and Montana Mining Co.'s mill at Phillipsburg. This is the fifth shipment made from this mill since the commencement of this year, and some of them have been much larger than the above.

UNIONVILLE.—Work is going on in all the mines, and all the mills are running, or preparing to do so. Hendrie's mill has been crushing for two or three weeks past. The National mill is pounding away, the new Cornish pump keeping the entire lode drained without half trying. The IXL Co. are putting up new hoisting works. We understood that they would start up to-day or Monday. The Columbia mill is running 30 stamps, and the machinery works to perfection. The Harvey mill is running on custom rock.

SLUICING ALL WINTER.—From Mr. Nick Murphy, of Silver Creek, in this county, we learn that on their claim on that creek, they have continued to sluice all winter, washing the dirt as fast as it was taken out.

QUARTZ CREEK.—Missoula Pioneer, March 2d: On claim No. 17 (upper discovery) better pay has been struck; a piece of gold worth \$19.25, and one worth \$2.80, were picked up recently in this claim.

CLEAN UPS.—Montanian, Feb. 22d: Mr. John How's mill at Brown's Gulch, returns 183 ounces of bullion last week. One ton of rock from the Pacific lode was crushed, and 23 ounces of bullion, worth \$10 per ounce, obtained. The Oro Cacho mine at Summit gave 75 ounces of retort, last clean-up.

BANNACK.—Cor. of same: Maysville has four quartz mills and one smelting furnace. All will start up on the opening of spring. At Jimmie's Bar, below, miners are drifting out pay dirt and piling it up for sluicing. At Jerusalem I met Mr. Brous and others making preparations for work. White's Bar is said to be rich, but lacks water. Wilson, Rote & Co., are constructing a large ditch. Quartz is creating considerable excitement. Andy Murray, on the Blue Wing, has a shaft 150 feet deep, and a crevice 1 1/2 to 2 feet in width. The average yield per ton is \$100 to \$150. The Kent lode has a shaft 24 feet deep; the ledge is five feet wide, and the ore yields \$150 per ton.

BANNACK.—Cor. of Helena Herald, Feb. 23d: This is the mildest winter since '62; yet there is more snow than for the two last winters. A prosperous mining season seems now certain. Quartz mining also will take a new impetus. Mr. Stapleton, who runs the Tootle & Leach furnace, ships every few weeks a cake of silver weighing 125 to 150 pounds. His ores cost him \$70 per ton delivered, and he makes a profit of \$65 to \$80 per ton.

FROM CABLE.—New Northwest, March 10th: Mr. S. Cameron was in town on Monday, with 310 ounces of gold retort, the result of the last run on Cable ore.

The Independent of 4th, says the Cameron Co. have suspended operations on account of too much water in the mine.

PHILLIPSBURG.—Mr. Ritchie returned from Phillipsburg Tuesday, and from him we learn that the Stuart mill has suspended operations. Work has also been stopped in the mines and everything looks blue. Capt. Plaisted appears to be convinced that the Phillipsburg mines will not pay. The bodies of rich ore being small renders the cost of extraction and reduction too great.

UNIONVILLE.—Gazette, 13th: The National has struck rich rock, and will start its other ten stamps. The IXL hoisting works will be in operation on Monday. Whitlatch Co. has suspended work since the return of Mr. W., though they have plenty of good ore in sight. Harvey & Co., of the Evelyn, have again struck at 3-foot lode of good rock. The mill (the Addis) has 15 stamps going.

New Mexico.

SILVER CITY.—Cor. Denver News: "I have seen a statement of about 100 assays, not one below \$90 per ton, and most of them between \$800 and 3,200 per ton. The facts seem almost incredible, still they are facts, and I firmly believe that Silver City will, this summer, be the center of the richest mining business known."

Lower California.

The Bulletin has been shown rich specimens of gold quartz from the Angel Cana mine, San Rafael, 80 miles below San Diego. The party showing stated that there were six mines running when he left, all working with arrastras. Three men took out \$10,000 in three months. There are no mills in the Camp.

Utah.

The Colorado Miner of March 16th says: "We have been permitted to read a letter from an experienced metallurgist, now in Utah. The gentleman knows whereof he speaks. * * In East cañon, Ophir City, is the new camp. Country rock limestone. The chloride veins are very irregular and "pockety." Some of them a month or so ago paying immensely, but now with little or no ore in sight. The ore averages \$225 to the ton, and, as it is nearly as soft as earth, when they do strike a pocket the daily product is often very large—10, 15, 20 and 25 tons. The Mountain Lion looked the best of any and has an open drift, 40 feet long, on one side of which is a wall of chloride 2 1/2 feet thick, which runs from \$200 to \$400 a ton. The big stories about the Emma are all true, or seem to be, it often turns out 100 tons of good ore a day."

Following is a telegram dated Stockton, (Utah), March 19th.—Rich chlorides have been discovered in Soldier Cañon, about six miles east of here, and the town is almost deserted. It is mostly float that has been found.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., March 23.

The excitement in the mining stock market has been kept up during the week, and Crown Point has kept rising and topping over unfortunates in a way to remind one of the happy old times. On Monday this stock, which went as low as \$2 last November, reached \$160, the highest yet. Several other stocks have sympathized more or less in this movement. Today the excitement was, if anything, greater than ever.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING MARCH 7TH.

- HOSE SPRINKLER.**—William Anderson, San Francisco, Cal.
TOOL FOR CARRIAGE-MAKERS' USE.—Geo. Atkinson, San Francisco, Cal.
MACHINE FOR MAKING HOOKS AND EYES.—Jeremy Taylor Ford, San Francisco, Cal.
SPRING FOR VEHICLES.—John R. Hiller, Woodland, Cal.
DOOR CLAMP.—Henry O. Hooper, Diamond Springs, Cal.
APPARATUS FOR BURNING HYDROCARBON OILS.—James R. Lee, Grass Valley, Cal.
BALE-TIE.—James E. Perkins, San Francisco, Cal.
WATER-CLOSET VALVE.—Alfred J. Smith, San Francisco, Cal.
GANG-PLOW.—James W. Sursa, San Leandro, Cal.
GRINDING PAN AND AMALGAMATOR.—Wm. H. Thoss, West Point, Cal.
SAFETY BRIDLE.—James Weatherhead, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

HYDRAULIC TURNPIPE.—S. Adams, Michigan Bluff, Placer Co., Cal. This invention relates to an improved turnpipe or tube with nozzle attached, to be used for delivering a stream of water in hydraulic mining. The improvements consist in constructing the pipe near the nozzle in such shaped sections that, when put together, it will be convenient for handling, and well adapted for delivering the water. It consists also in a device for relieving the great strain exerted by the water on the moving joints, in order that the nozzle may be easily directed towards any desired point.

SULPHURET-SAVING MACHINE.—C. C. Coleman, S. F. This is an apparatus designed for saving sulphurets and separating them from the lighter matter which escapes from the mills or from sluices in ordinary placer or hydraulic mining. It consists of a large hollow revolving vessel, which may be cylindrical in shape, or may be slightly tapering, so as to be somewhat smaller at one end than at the other. This cylinder, or cone, revolves on a horizontal axis. On the inside is a spiral screw which causes the sand to move from one end to the other as the cylinder revolves, while the sides are cleared of adhering matter by a spray of water from a perforated pipe which extends through the cylinder from end to end. The inclination and arrangements are such that the sulphurets (which are introduced at the lower end), are discharged by the revolution at the upper end, while the lighter matter is washed out at the lower end.

CAM FOR QUARTZ MILLS.—O. P. Hart, Logtown, El Dorado Co., Cal. A very considerable saving in time, labor and expense can often be effected by having a cam cast in two sections, so as to be readily secured upon, or removed from, the cam-shaft without disturbing the shaft or other parts of the machinery. Mr. Hart has an improved construction and method of uniting these cam-sections, whereby the strength of the cam is not materially impaired, the cost of manufacture is slight, while the ease and convenience of replacing any injured cam or section is greatly increased.

EXPLOSIVE COMPOUND.—J. Hafennegger, S. F. Mr. Hafennegger is well known on this coast for his experiments with explosive compounds. His present invention relates to a mixture which shall possess in a high degree the strength and safety required in such an agent, and also to an improved cap, which shall be cheap, and at the same time sure and effective.

The Reinshagen and Buckman Pulley.

We illustrate below a device for securing pulleys, gear-wheels, etc., to shafting, which has been extensively used at the East, and which has given excellent satisfaction according to a number of testimonials which are given. The following is the description furnished.

This invention has for its object the production of a fastening device, applicable alike to both hollow and solid shafting, and one that shall secure the hub of the pulley or wheel to the shaft in such a manner that the pulley or wheel shall not, by the act of fastening, be forced out of its required concentric position on the shaft, and one that shall cause the hub to hug the shaft equally in all directions. In construction, the hub of the wheel or pulley is of a "crowning" or double cone shape, to which two rings are made to match, the hub on each side being slotted or severed at two or more points, in order that the rings, when driven on the cones, will serve to contract the bore of the hub and compel it to hug the shaft.

In the accompanying engravings, Fig. 1

Fig. III.

Fig. I.

Fig. II.

REINSHAGEN & BUCKMAN'S PATENT PULLEYS.

is a perspective view of a pulley embodying this invention, one of the rings being detached. Fig. 2 is an axial section, with both rings in place. The hub, A, is tapering from both ends alike, in the manner shown, and is fitted with rings, B B, which are tapering to match the hub. At each end, from the extreme end to points near the arms, it is split, or slotted, entirely through at two or more points as shown, for the purpose of rendering the hub elastic, and enabling it to be closed or contracted in size, by the driving on of the rings, B B. It will be seen that the simple act of driving on the rings, B B, serves to force the hub tightly, in all directions alike, to the shaft, and preserves the concentricity of the pulley, or wheel.

Fig. 3 shows the pulley in position, also the pulley-coupling attached, being the same in construction as the pulley; its simplicity enabling one to disconnect the shaft, or remove the pulley with ease, in the shortest possible time.

It is well known, in the use of the common taper-key, or the set-screw for securing pulleys, etc., to shafts, that the inside of the hub, when fastened, has but two points of bearing on the shaft, and those mere line hearings, and that neither the key nor set-screw is admissible for hollow shafts in consequence of their liability to indent or collapse the shaft. The key, or set-screw, also forces the pulley or wheel "out of true," even when a good fit, so that when these fastenings are used, the inconvenient "driving fits" are essential.

With this device for attachment of the pulley to the shaft, the hubs may be bored a loose fit, convenient to adjust and re-

move, and yet, when fastened, be always concentric to the shaft.

The patent right for this device is owned by Messrs. Reinshagen & Buckman, of the Queen City Machine Works, 87 East 8th street, Cincinnati, who may be addressed for further particulars or for rights to manufacture.

Our Irrepressible Rodent.

The foresight and industry of the ant, the exactitude and care of the bee, and the faithfulness and docility of the dog, have long been proverbial. But who, hitherto, has been found to celebrate, in verse or prose, the sagacity and engineering skill of California's pioneer miner—the Gopher?

For how many ages prior to our gold-digging era has he tunneled and drifted, carried dirt, and "made his pile." How skillfully all his operations are performed; how regular and smooth the interior of his habitation; with what energy and diligence he applies himself to his daily labor. Surely we may dole out to him some measure of that respect which all men intuitively,

two short for a rat's, and his teeth much too long; his nose is much flatter and rounder; and although his hair and skin are soft like a rat's, the color is different.

By the way, do any of my lady readers know that the very finest Paris kid gloves are made of tanned ratskins? If not, tell them in a whisper, Mr. Editor, or they may faint.

The gopher is of a dull reddish brown on his back and side; his belly being of an ashy gray hue, and his paws white. His claws are strong and powerful, not retractile, and he has two long incisor teeth in either jaw, that protrude beyond his lips and lend a fierce expression to his face; he is also provided with two capacious pouches, lined with fur, that open externally just in front of the shoulder. Nature has thus provided him with mattock, spade, and wheelbarrow; and right diligently he plies his implements. The distance to which he will extend his burrow, in a single night, and the amount of earth that he brings to the surface, and makes into those well-known, neat little mounds, manifest his astonishing powers of endurance, and continuous hard work. My description may be thought incomplete should I omit to say that he belongs to the family of the mole-rats (*Aspalacidae*).

Unlike most rodents, such as the beaver, the common rat, etc., this curious little creature is most unsocial. An animal so singularly shy, solitary and savage, is rarely to be found. He is a thorough Ishmaelite; his hand against every man's, and every man's against him. In the whole animal kingdom he counts no friend. Hawks and cranes by day; badgers, 'coons, and all provlcers in the darkness by night; cats, wild and domestic, by day and night—all combine to compass his destruction. Not only are all creatures of other species inimical to him, but innate in his breast, he cherishes a deadly animosity to all rivals of his own kind. In his burrow he tolerates no intrusion. Should a neighbor break through into his premises he is immediately seized, and a war of outrage entered upon.

The Indians (who by the by, are good naturalists) were well acquainted with this trait in our friend's character, and laid their plans to trap him accordingly. One gopher having been captured and well secured to a long line, they placed him in the "run" of the gopher they wished to catch. Gopher No. 2 finding his territory invaded, rushes on the intruder; a fierce duel at once commences, tidings of which are communicated telegraphically to the Indian holding the free end of the line. He proceeds to haul in the cord, but so savagely is the combat still raging, and so tight is the grip each has of the other, that both gophers find themselves in the hands of the Indians before they are willing to cry, "Hold, enough!"

A CONVENIENT FIRE-KINDLER.—Mr. John W. Still, of this city, has just patented, through the SCIENTIFIC PRESS Patent Agency, an improved material for kindling fires. The trouble often experienced in getting a fire to burn is sometimes quite serious, especially for young housekeepers. But here is provided, in very compact form, a most irresistible fire persuader. It consists of cocoa-fibre or redwood bark thoroughly saturated with pitch, rosin or other highly combustible gum, and in some cases with other substances. It comes in small cakes, one of which is sufficient to kindle wood or coal. It is light, clean, cheap, and serviceable. It is denominated "Coco Pino," and can probably be found in any grocery store. The principal depot for the article is that of J. W. Still & Co., Washington street.

The first number of the *University Echo*, a monthly sheet published by the University of California, or, more strictly, by the Durant Rhetorical Society of the University, has been received. It is certainly remarkably good, both in substance and appearance. If it continues as it has begun, it will give the Eastern foreigners a better idea of the abilities of the Pacific student than we now believe them to have.

RAILROADS.—Since the war, Alabama has built 296 miles of railroad, Georgia 231, Tennessee 155, Texas 132, North Carolina 146, South Carolina 128, Virginia 104, Mississippi 128, Arkansas 90, and Florida 44.

though perhaps grudgingly, yield to real workers.

In many ways he is worthy of some slight notice, but it must be allowed that his chief claim to attention is the amount of mischief to which he must plead "guilty."

So great, in fact, is his ability to work wreck and ruin, that it might be instructive if one of my youthful readers, just beginning his troubles in algebra, would endeavor by the cabalistic mysteries of x and y , to solve the problem as to whether a "bull in a china shop" or a gopher in a garden, would work the greater mischief in a given period.

Probably most persons have seen some of the gopher's handiwork in their fields or gardens, but to many the animal personally is unknown. Let me try to introduce such to our little friend. Here is one just drawn from his burrow—in the trap. See how viciously he bites at the iron which grips him in a death clasp; he has already broken two of his long teeth in his vain efforts after freedom. Now he is dead, and as I hold him up for inspection the first sound that meets my ear is a small shriek from some fair reader, followed by the exclamation, "the horrid thing—it's a rat!"

I must admit that there is some excuse for the remark, as coming from one unacquainted with the vermin in general. But, if a rat, what has he done with his tail? where are the large ears? the long whiskers? the big lustrous eyes? His legs are

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARR before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Phosphorus—it Exists in Man.

LECT. V. Mar. 18.—Phosphorus, the name signifies bearer of light, was first discovered in 1672. It is a substance which is found quite largely in Nature under certain conditions. It exists in the bodies of animals, especially in the bones, about one-half of which is phosphate of lime and nearly one-half is what is called gelatine. I have here a bone out of which the phosphate has been taken, leaving the gelatine, and you see that I can twist and bend it and even tie it up in a knot.

The proportion of the phosphate and of gelatine is not the same, however, in all animals nor even in the same animal at all ages. When young, there is more gelatine and less phosphate of lime, and when old, less gelatine and more phosphate, relatively, in the bones of animals. This explains the reason why a child's bones will bend more easily but break with more difficulty than those of a grown person.

The bones of an adult weigh, we may say, about 10 pounds. About one-half is earthly matter, mostly phosphate of lime, say 5 pounds. About one-half of this, nearly 2½ pounds, is phosphoric acid, and again about one-half of this, 1 to 1½ pounds, is phosphorus.

There is also more or less phosphorus in the blood, the brain and the nervous system. It gets into the body from the food, for phosphorus exists in bread, in all kinds of grain, in leguminous and other plants, particularly in the seeds. The plants derive it from the soil, for it exists in minerals. This mineral, which I have here and which is called *Apatite*, consists of phosphate of lime, the same combination which exists in our bones.

The principal store-house from which we extract the phosphorus for use in the arts is the bones of animals. If we heat bones in a closed vessel they become blackened, charred, and we get *bone-black*. If we heat them in the air, we burn away the gelatine and get a white residue of phosphate of lime. The lime is then separated by sulphuric acid, leaving phosphoric acid, a compound of phosphorus and oxygen (P_2O_5). We can remove the oxygen by heating with charcoal powder, getting carbonic oxide, and leaving the phosphorus.

Experiments with Phosphorus.

Phosphorus has a strong affinity for certain other bodies, as chlorine or oxygen, and is never found uncombined in Nature. So strong is its affinity for chlorine that on putting a piece into a jar of chlorine gas, it burns, combining with the chlorine. It will also combine with oxygen, but must be previously heated to a certain temperature, about 150°. At 111° it melts.

Phosphorus enters into several different combinations with oxygen. If we burn it in a tube where only a certain amount of air can get at it, it forms a lower compound called phosphorous acid, P_2O_3 , which is this white smoke; and this red substance is a still lower compound, oxide of phosphorus, P_2O . If I ignite this piece of phosphorus and place it in a jar of oxygen gas, it gives an intense light, burns to phosphoric acid. This acid is readily absorbed by water, and colors blue litmus red.

Phosphorus is not soluble in water. If exposed to the air, it diffuses a white smoke and a light (it phosphoresces), which is very easily seen at night; it oxidizes, but the oxidation occurs at a low temperature, too low to occasion ignition, and is called *slow combustion*. In using phosphorus we must be careful to exclude it from the air (we usually keep it in water) as there is danger otherwise of its catching fire.

Phosphorus is dissolved to a certain extent in sulphuric ether, but more readily in sulphide of carbon. I have here a solution of sulphide of carbon holding phosphorus. I pour some on this paper. As the sulphide of carbon is very volatile, it rapidly passes off as vapor, leaving the phosphorus in a very fine powder on the paper, and this, as you see, inflames as soon as the sulphide of carbon is volatilized. Such a solution is therefore very dangerous, and, indeed, is sometimes used for setting buildings on fire.

Lights in Graveyards—Jack O'Lantern.

There is another compound—of phosphorus with hydrogen—the properties of which I can show you. I make it thus: I have here a glass retort. In this I put phosphorus and a solution of potash (soda or lime would do as well), also a few drops of sulphuric ether. I dip the end of the retort under water and heat the bulb. The only use of the ether is to drive out the air from the retort, which it does immediately, being very volatile. When the solution boils, bubbles rise, from the end of the retort, to the surface of the water, but as soon as they come into contact with the air they inflame spontaneously and beautiful rings of white smoke are thrown out. The bubbles are filled with phosphide of hydrogen (PH_3). The gas ignites on reaching the air, forming phosphoric acid—the white smoke—and water.

Now, you have all heard of, some of you may have seen, the luminous phenomena or "ghostly lights," of the cemeteries. Those are nothing but what I have just shown you. When the solids and the fluids of the body decay underground, where there is a deficiency of air, phosphide of hydrogen is formed. This, being diffused through the soil, comes to the surface in very small amounts, and, as in the case of phosphorus, gives a luminous appearance instead of a flame.

The phenomenon of the "jack o'lantern" is similar. The carcasses of animals decay in cold, wet places, and the phosphide of hydrogen is formed and inflates a light jelly-like substance, just as carbonic acid distends dough in bread-making. The inflated substance, having about the same density as air, is carried hither and thither by any currents of air, and the phosphide of hydrogen, slowly exuding, gives the luminous appearance as before.

Its Use—Matches.

Phosphorus is used principally for making matches. But it must, for use, have some other substance mixed with it. If I melt a piece of phosphorus in a tube, then insert a stick into the melted substance and withdraw it, the phosphorus inflames but doesn't make the wood burn. This is because phosphorus burns so quickly that the wood is not heated sufficiently. Phosphorus burns at 150° and sometimes at a lower temperature, but wood requires about 1,000°. But if I first tip the piece of wood with sulphur, and then add the hot phosphorus, the latter will, on igniting, inflame the slowly burning sulphur, and this in time will inflame the wood.

This illustrates the principle of the match. Matches are first tipped with sulphur and then a paste, of gum or glue or similar substance thoroughly incorporated with phosphorus, is added. In this paste there is also added some oxide, as oxide of lead or nitre, to provide the necessary oxygen. The glue glazes and protects the phosphorus from the air, that it may not inflame spontaneously. When we rub the match, we rub off the coating and, by friction, elevate the temperature sufficiently to ignite the phosphorus; the oxides furnish sufficient oxygen to support combustion, the sulphur is ignited and, in turn, ignites the wood.

Although phosphorus in its elementary state is a violent poison (it is frequently employed as a rat poison), yet when combined with other elements it forms an essential part of our bodies and a necessary constituent of our food.

We Impoverish the Soil, and waste Millions.

As I before said, phosphorus exists in grain. We can make an interesting and important calculation for our State. If we assume the production of wheat in California as 18,000,000 cents, this will contain about 7,000 tons of phosphoric acid, which is equal to about 15,000 tons of phosphate of lime. The value of this amount which is taken from the soil, estimating from the value of common bone flour or meal, may be put at \$1,600,000.

Now every person requires a definite amount of food. We may, in general terms, say this is equal to about 30 bushels of wheat yearly. Hence the 500,000 inhabitants of California will consume each year the phosphate of 9,000,000 cents, or about 3,500 tons of phosphoric acid, worth about \$800,000. The 40,000,000 people of the United States would thus consume the phosphates of 720,000,000 cents of wheat, or 280,000 tons of phosphoric acid, worth about \$67,000,000.

We see then how much valuable substance is removed from the soil of California yearly. Do the farmers seek to replace it? No. They even try to waste the valuable substance of the straw by burning it. We take pains that the phosphorus consumed by our bodies shall be carried away out of the State, washed into the

ocean to be transported long distances and consumed by animals elsewhere. We are throwing away the matter which, deposited in part as guano, we shall be importing from distant places forty, fifty, a hundred years hereafter. The grain which we export may be considered a permanent loss, but the phosphates which we eat might be saved. Of course our soil does not yield such crops as it did.

No one will calculate the value of the amount wasted by each individual as less than \$5 per year. Probably it is nearer \$10, but we will say \$5. The waste then of the 500,000 inhabitants of California amounts at least to the sum of \$2,500,000 every year.

You may ask: Is this practical? Yes. We are impoverishing our soil, wasting material of great value, every pound of which might be saved.

Artificial Stone Making in San Francisco.

We visited the Pacific Stone Company's works, on Turk and Larkin streets, last week, and found that they had twenty men busily employed and were turning out daily two tons of stone, chiefly for ornamental work. This shows that the merits of their manufactured article is being appreciated here.

We have previously described fully the method of manufacturing the Ransome stone, and have spoken of its excellent qualities, qualities which have been proved by the severest tests and are attested by the highest authorities. The stone withstands the effects of heat and cold, moisture and dryness, and other climatic influences. It is a perfect imitation of natural sandstone, and is, in fact, a stone, not plaster, nor concrete. It can be shaped after any design, however intricate, at a comparatively low cost, and the more complicated the design, the less the expense compared with that of natural rock.

We see that the company are making colored stones, the color penetrating the whole piece and being indestructible, we are told. We were assured that they were prepared to reproduce in the stone any color or shade of color which might be desired.

Every stone in the very handsome church which Dr. Stone's congregation are building, is furnished by this company. Ornamental work is being done for the grounds of Mr. Ralston, at Belmont. There are some very fine specimens of work for the lot of Mr. Thomas Anderson, at the Masonic Cemetery. The vases which are to be placed on each side of the steps, and which are fashioned after designs by Messrs. Wright & Saunders, are as fine as anything in stone in this city. For lots in Lone Mountain cemetery some very nice decorations are being manufactured. A font is being made for St. Paul's church at Benicia, etc., etc.

Grindstones are quite a speciality. One was shown us of 70-inch diameter, weighing 1½ tons, made for the California File works. Indeed, we saw stones varying from 70 inches to 3 inches in diameter, and from 12 inches to ¼-inch in thickness, which are made here.

This company have made a contract with Mr. Ransome, in virtue of which he will remain here several years. This fact will give additional guarantee to the excellence of the articles which will be manufactured. Their business will undoubtedly increase to large dimensions, and is already almost too great for their present capacity. We understand that the company will enlarge their works this summer.

THE Sacramento Union completed twenty years of existence last week. Like wine the Union improves with age, and it has justly attained the foremost rank in our State.

ICE MANUFACTURE.—The Alta states that negotiations have been entered into for the manufacture of ice in this city with the Carré machine.

GOOD HEALTH.

AN ULCER CURED BY A DOG.

James M. Hole, M. D., writes as follows to editor of the *Herald of Health*:—Some time in the month of February, 1864, I was called to see an elderly man—say 60 to 65 years of age. On entering he said: "Doctor, here is a very sore arm for you; I have had many doctors to treat me, but here it is. By this time he had the bandage removed from it, and just at that moment a large dog got up and walked over to his master, as he held the arm exposed, filled with bloody, pus-looking stuff—a bad looking ulcer indeed. The dog offered to lick it, but he ordered him away. I said: "Let him lick it off, if he will; I can see it better." "Here, Watch!" The dog walked up, went to work and licked it clean and nice from the shoulder to the wrist. The man seemed to experience considerable pain, but I kept his attention by getting an explanation of how long the sore had been there, the cause, etc. When the dog had finished, he retired to his resting-place on the rug in the room perfectly contented.

In answer to an inquiry as to the cause of the ulcer, he said: "I was bitten by a garter snake in harvest. My arm did not pain me much, and I did not tie it up; but after a while it became very much swollen. I doctored myself for some time, and then went to Dr. A., who said he would cure it in six weeks, but got worse instead of better. Then for one month I was under the care of Dr. B., but experienced no change for the better. I then used three or four bottles of patent medicine, but it did not help me. I began to think it a very bad case. Finally, I tried a German doctor; have taken medicine, but it still remains uncured. I have sent for you to ask what you think of it."

The man presented a generally ulcerated surface. I indeed thought it, as the man himself remarked, "a bad case." I ordered him to let the dog lick it three times a day, and if necessary, apply a little lard to it to induce him to lick it faithfully, and after each operation to apply a cloth moistened with melted lard and salt. I told him to call at my office in ten days. I did not see him for about six weeks, when he came, saying: Good evening, Doctor. I am well! How much is your charge?" Said I "One hundred dollars—what you offered." He replied—"That is too much; I will give you twenty-five dollars." "All right." I took a good look at the arm—it was well and entirely healed. I have no doubt as to the dog being the instrument of cure. I mentioned the fact to some of my medical brethren, but it did not seem to impress them favorably, and so it has remained ever since, as above stated.

THE USE OF LEMONS.—When persons are feverish and thirsty beyond what is natural, as indicated by a metallic taste in the mouth, especially after drinking water, or by a whitish appearance of the greater part of the tongue, one of the best "coolers" internal or external, is to take a lemon, cut off the top, sprinkle over it some loaf sugar, working it down into the lemon with a spoon, and then suck it slowly, squeezing the lemon and more sugar as the acidity increases, from being brought up to the surface from a lower point. Invalids with feverishness may take two or three lemons a day in this manner, with the most marked benefit, manifested by a sense of coolest comfort, and invigoration. A lemon or two thus taken at tea-time, as an entire substitute for the ordinary tea of summer, would give many a one a comfortable night's sleep and an awakening of rest and invigoration, with an appetite for breakfast, to which they are strangers who will have their cup of tea and a hearty supper.

RIPE FRUIT AND COLD WATER.—"Can a nursing mother eat ripe fruit of all kinds, and drink cold water?"

She can and should. Ripe fruit is one of the best articles of food, and cold water the best and only drink needed. The fruit should not be eaten between meals, but as a part of the regular meal. It should always be thoroughly masticated. Cold water should not be drunk at meals, or soon after eating, as it retards digestion. The prevalent idea that nursing mothers must be fed upon warm slops is a fallacious one, and the practice is injurious to both mother and child, and should never be adopted.—*Good Health*.

As sore throats are very prevalent, it may be of service to the afflicted to know that a gargle of a little alum and honey, dissolved in sage tea, will relieve it.

"TWO YOUTHFUL CHEMISTS."—None at all. The only danger would be of the lights being extinguished. The idea of explosion probably comes from a fancy that the water would be decomposed into its two elements. The heat, however, will not decompose water.

Can Any Good Come Out of Nazareth.

We illustrated and described, last October, the "Universal Wood Worker," manufactured by Messrs. McBeth, Shaffer & Co., of Hamilton, Ohio. These gentlemen now inform us that our description brought letters from people "way down in Maine," and that they were somewhat surprised to know that the letters from that direction were brought through the influence of a Pacific Coast paper. The Press circulates principally on this coast, but is taken also in all sections of our country, as well as in South America, Europe and Australia; and as its reliability is well known, its influence is correspondingly great. This fact it may be of advantage to many to "make a note of."

ORCHILLA PICKERS.—It appears that the 300 emigrants reported as having left New York recently for Magdalena Bay, were sent out by Eastern parties under special contract, to pick and plant orchilla.

EXPERIMENTS have been made in France to ascertain what element it is in gas which causes it to be so destructive to trees near which it passes. The hydrogen and the carburetted hydrogen do no harm, but the tar element, and especially the carbolic acid, does the mischief.

A PORK PACKING ESTABLISHMENT, on the Cincinnati plan is about to be started at Soquel, in Santa Cruz county.

THE fruit crop of Butte is very promising, and bids fair to greatly exceed that of any former year.

The Bureau of Mines.

We publish on another page the Constitution and Rules adopted by the Directors of the Bureau of Mines and Mining Statistics of the Pacific Coast. We recommend the subject to the careful consideration of our mining community.

There are many capitalists in Europe and elsewhere, who are ready and desirous of investing in good mining property on our coast, but who are deterred by the swindles which have been so often perpetrated. There are, on the other hand, very many mine holders here who desire to dispose of their property, but are unable to do so.

The Bureau proposes to stand between these two parties, giving the one better opportunities for selling and guaranteeing the other against hare-faced cheats, against all but the risks incident to all business enterprises. Persons holding mines for sale can register them here at a small expense, filing proofs as to actual existence, location, and clear title. These proofs are required. Such registrations are open to the public, a fact itself of importance, as swindles cannot stand publicity.

The Bureau, we are assured by a Director, does not propose as its main purpose, to directly effect the sale of all the mines registered. After the capitalist has investigated the lists, it will engage an expert to examine further any particular mine, if so desired; or the capitalist may engage an expert for himself if he prefer. This we consider wise. If the Bureau proposed to sell mines, it would, in our opinion, run the risk of speedy disaster.

The Bureau will, therefore, act more as a mercantile agency or "Lloyd's," for the diffusion of trust-worthy information, and as such, if properly managed, it can be of the greatest benefit to the coast. It will be supported principally by the registration fees. We are inclined to be more hopeful as to its success than we were at first. We have been assured that the main promoters of the enterprise have the confidence of much French and English capital, and the Board of Directors is one calculated to inspire confidence. They must conduct affairs with tact and business ability; and if they do this, they will undoubtedly meet with success.

One point in the Constitution we may comment on. The Directors should carefully prepare a rule for the method of electing delegates to the conventions, and should diffuse widely among our miners information as to the real objects of the Bureau. The character of the convention, and of the Directors, is a vital matter for the institution.

RAMIE—AN IMPORTANT MOVEMENT.—Some of our enterprising citizens have bought all the ramie roots in market; and they are now being planted for crops of fibre, near Hayward, Alameda county. Mr. Finch goes to New Orleans for one of Lefrauc's machines to work it here. Planters in Louisiana seem to be entirely satisfied with this fibre dresser. It costs \$500, and it prepares 500 pounds of fiber per day from the green stalks, at very small cost. This machine makes ramie the most profitable production for the farmer for several reasons, viz.: It needs but once being planted; and every year thereafter, it yields three crops, aggregating one and a quarter tons of fibre to the acre. The refuse, turned under, fully manures the ground. Interwoven with silk or wool, it makes what are called stuff goods, which are in great favor. We believe this company sets out 250,000 plants, which assures a firm footing for this new product in California. The plant, like others of the nettle tribe, has no parasites. It remains to be seen if gophers find it attractive.

MUSTARD.—A large quantity of mustard is to be sown in Monterey county, this season.

Academy of Sciences.

The S. F. Gold Diggings.

At the regular meeting on Monday, after several donations to the cabinet had been received, Mr. Brooks stated that he had procured some of the gold from the Black Point sand hill, and had it assayed by Mr. H. G. Hanks. The "gold" proved to be brass. Mr. Hanks had visited and examined the locality. On the top of the bluff, for the space of several hundred feet, the sand is of a dark color, and, on examination, proved to be black magnetic sand. By washing samples, which had been taken from a number of places, particles of the supposed gold were obtained. These, under the microscope, presented the appearance of turnings and filings, and, when examined chemically, proved to be brass, as did the sample furnished by Mr. Brooks. Mr. Hank's theory was that there had been a machine shop on the ground, or possibly the brass filings had been placed there to deceive people, although it was difficult to account for the black sand and the even distribution of the filings.

New Mineral Localities.

Mr. Durand presented the following list of localities (not yet mentioned in the published catalogues) of certain minerals:

CALIFORNIA.

Magnetic Pyrites.....Nevada Co.
Metacinnabarite.....Redington mine, Lake Co.
Natrolite.....Los Angeles.
Partzite.....Blind Spring District, Mono Co.
Pectolite.....Dry Dock, San Francisco.
Vivianite.....Copperopolis, Calaveras Co.

NEVADA.

Anglesite.....Meadow Valley.
Bohrerite.....Irving Ledge, Reese River, Lander Co.
Branite (impure).....Meadow Valley.
Calamine.....White Pine.
Cerrusite.....White Pine.
Fluorite.....White Pine.
Massicot.....Mountain Dist.
Turquoise.....White Mts., Columbus Dist.
Ulexite.....near Columbus.
Vanadate of Lead.....Mountain View, Virginia City.
Silicious Earth, Diatomae.....Washoe.

ARIZONA.

Brochantite.....Mineral Hill, William's Fork District, Yuma Co.
Cinnabar, with silver and gold...Eugenie mine, Weaver District.
Fluorite.....Gen. Lyon, Castle Dome.
Minium.....Castle Dome.

IDAHO.

Halloysite.....Poorman Mine.

MONTANA.

Sapphire.....

LOWER CALIFORNIA.

Bournonite.....Triumpho mine, La Paz.
Cuproscheelite.....La Paz.

MEXICO.

Stilbite.....Guaymas, Sonora.

Recording Sub-Surface Temperature of the Sea.

Professor Davidson reported that the apparatus he had devised for recording sub-surface temperature for great depths, by means of a thermo-electric pile, had made good progress, even against the previous opinions of the instrument maker himself. It is proposed to register the depth by the well-known means of breaking the circuit of an electrical current passing through two insulated wires in the sounding line—say every 100 fathoms—by means of the wheel-work of the Massey or similar apparatus. In the changes of temperature, an electro-thermal pile, eighteen inches long, insulated, surrounded by a non-conductor, except one end, is used in combination with a Thompson's Reflecting Galvanometer, not liable to derangement on shipboard. At every 100 fathoms, when the chronograph registers the depth, the observer notes the reading of the galvanometer, which readings are reduced to Fahrenheit degrees.

Dr. Blake suggested that the unexposed end of the thermal pile should be surrounded by ice, and that by a non-conductor. Prof. Davidson thought the suggestion worthy of consideration. All arrangements must, however, be such as are compatible with the size of the apparatus.

Plagiarism.

There was some discussion concerning the fact that some Eastern scientists had appropriated discoveries made on this coast by residents, and had claimed originality after descriptions had been published here. Dr. Gibbons remarked that no one could be blamed where the Academy had not given full publicity in scientific journals. A number of cases were instanced, however, where such publicity had been given. Some of the most bare-faced plagiarism have been committed by English pseudo-scientists.

Mining Schools in the United States.

We have received a pamphlet, with this title, which is reprinted from the *North American Review* for January. It is written by Mr. John A. Church, of New York, and is excellent in its matter and style.

The pamphlet gives an interesting account of the principal mining schools of Europe and dwells forcibly on the necessity of having such institutions in the United States. That we need them is certain. The writer considers finally the question as to the best location for the schools. He concludes that, for the present at least, two schools would probably be sufficient for our country, one for the East and one for the Pacific coast, and that the former should be situated in New York, and the latter in San Francisco.

We agree with the writer in the general conclusions given in the article, except as regards the location. We believe that the best location for a mining school is "at the mine's mouth," at least for a mining school endowed by the Government and not dependent on private bequests. The great argument for a city location, in our opinion, is that of the pecuniary assistance which is more readily obtained in a large commercial center than in a smaller mining town. This applies to those institutions which are supported by individual liberality, and it is mainly to such that the article in question is intended to apply. We believe, however, in the establishment of Government schools, and hence there is really no direct opposition between our remarks and those of Mr. Church.

The advantages, other than that just spoken of, for a mining locality seem to us most important. We believe that practical opportunities should be furnished to the student at the same time the theoretical instruction is given. Otherwise he will get only the most crude, often very erroneous, ideas, even under the best instruction. To take an extreme case, the best teacher might lecture and instruct concerning minerals for years, and yet the student would be utterly unable to determine even the commonest species, if he did not have the minerals to examine while being told their characteristics. So it is with very many things in mining and metallurgy. We remember meeting a party of students from the Berlin Mining Academy on their getting into a mine for the first time. They had studied the subject in Berlin under good teachers for at least a year, yet their ideas concerning a mine were in many instances comically absurd. A young man can no more be properly instructed in mining away from a mine, than can a farmer learn agriculture away from a farm, or a mechanic comprehend machinery away from a workshop.

The benefits of a city location are, we think, generally over-estimated. One great point advanced is in the outside educational advantages. Now before a person takes up the study of a specialty, he should have received as extensive a general education as can be given him. This will depend to a great measure on individual circumstances. But when a student has once entered upon his special mining course, he has all that he can do properly in studying mining. Take the courses of lectures at Freiberg, for instance. We use the list given in Mr. Church's article. They number thirty. Add to these the time required in the laboratory, the drawing room, the cabinet, the field, the mines, at the furnaces. How much spare time will a student get in the few years he can devote to prepare himself for practical life?

We believe that there is many a better place for a mining school at the East than New York. There are various objections to a large city which will occur to our readers. We may refer to one, not as the most important necessarily, but because people try to reason it away by unmeaning

figures. It is the expense of living. To live decently in New York costs money. The expense of living is fairly estimated not from the lowest possible sum, but from the average sum expended by one's associates. To expect a young man to live much more meanly than do his friends, is to be unreasonable. Although this particular objection has not so much force in this city, yet we believe that Grass Valley, for instance, would be a better location than San Francisco.

As to the point, advanced in the article, that to have the school at the mines is to defeat its very purpose by giving undue importance to one metal and ore and thus give an imperfect, one-sided education, we differ from the writer. Such a result may follow from improper instruction, it does not necessarily result from the location. Again, mining schools do not turn out finished mining engineers, but only young men who have been given advantages which, if availed of, will enable them to become mining engineers of high rank, and that in a much shorter time than is possible for those who have not had such advantages.

The foolishness of tacking on a course of metallurgy or mining to each and every college in the country is dwelt on with justice. A few well-supported schools are what we need. To divide our resources up into a thousand small sums, is almost as bad as to throw them entirely away.

The pamphlet in question has been reprinted at the request of the Trustees of Columbia College. It would be an excellent idea for the Trustees to circulate it in our Western States and Territories. We have, perhaps, hardly done it justice, and advise our readers to get it, if possible, and read it, thinking over the various points for themselves.

They will find much in it that is worthy of consideration, and cannot but be benefited by its thoughtful perusal.

Ware's Traction Engine.

The object of the builder of the engine, represented in our engraving, has been to produce a self-propelling steam carriage for running on common roads, or on ice, and an engine which can be adapted to the work of the farm, to driving thrashing or other machinery, pumping, watering gardens, and other purposes.

One form of the machine is shown in the accompanying engraving, and presents a very neat appearance. The boiler is held between two forks of a steel frame, which meet on the forward axle and diverge towards the rear. The engines work on an incline, and drive a shaft which actuates the rear wheels by means of a chain. The engine is intended to give three revolutions of the first shaft to one revolution of the driving wheels. The difference can be multiplied to nine times. A lever in front of the driver's seat serves to guide the machine when used as a carriage, and a rod with handle connected to the engine shaft readily reverses the motion of the engine.

The engine can be easily guided when traveling at the speed of a fast horse. The relative speed and power of the wagon can be readily changed without stopping the machine, which is of great advantage when ascending heavy grades and passing over rough and uneven roads with the steam wagon. A link motion is not thought sufficient, and it is certainly inconvenient to be obliged to stop now and then to change the gearing.

The engine has some peculiar features. The cylinders are set at right angles to

each other, both being bolted to one casting and working on one crank. One eccentric works both valves, in backing and in going ahead. Steel and gun metal are largely used in the construction to insure strength with the least possible weight. The boiler is made to stand a high pressure, as it should be in all such machines.

The cut represents a comparatively small steam wagon. A larger one would be no longer or wider, but the boiler and machinery would occupy more space inside the wheels. The inventor, who has been in this State for some time, thinks that rubber tires would be unnecessary here, but he uses a corrugated tire or some similar device to prevent slipping. In one case he tried successfully smooth tires with pieces which were readily adjusted in a few minutes, when the engine was used for drawing loads or plowing.

The machine is a complete engine of itself, capable of doing the work ordinarily performed by the portable or stationary engine, and also adapted for locomotion. The inventor is confident that his machine

intersection with the U. P. R. R., and that measures be taken to organize the Portland, Dalles and Salt Lake R. R. Co.

In January it was announced that the California and Oregon branch of the C. P. R. R. would be pushed through to the Oregon line this year. The *Shasta Courier*, of the 11th, states that Hood's party, having completed and corrected the preliminary survey from Tehama county, through Shasta and Siskiyou, to the boundary, have been discharged.

The San Francisco and Northern Pacific R. R. Co. are pushing the grading on the line from Santa Rosa to Healdsburg, and it is stated that the cars will be running as far as Healdsburg by next June. The California Pacific have also commenced work on a branch of their road to run through Sonoma county. They began at Santa Rosa, to run up north, and statements are made that the line will reach Cloverdale this season. From Santa Rosa it will run south to Sonoma and thence to Vallejo, possibly via Napa. This will give Sonoma two roads.

The Vaca Valley Road may be extended up north to Pleasant Valley and thence possibly to Putah creek and beyond. The

to Tehachepa Pass, Kern county, where it will join with the Southern Pacific of California. This last is running now from San Francisco to Gilroy, 80 miles, and large quantities of iron are reported on the way for its continuation. It is stated that 20 miles more will be complete by July.

It is proposed to build a narrow gauge road from San Francisco to Menlo Park, about 30 miles. The *S. F. News Letter* learns from reliable sources that E. N. Robinson is organizing an engineering party to locate a narrow gauge road from San Francisco down the coast to San Diego.

The survey of the proposed road from Nevada and Grass Valley to Marysville was commenced on Feb. 16th., under charge of Mr. R. L. Harvis, one of the best engineers on the coast. The grades, as far as the survey has gone, are reported to vary from 35 to 116 feet. On the 18th inst., the survey was carried from Grass Valley as far as the county line.

In Utah there are several railroad projects. It has been reported that the Central Pacific will build a line from a point three miles west of Ogden to Salt Lake City, a doubtful report. Congressional aid has been requested for a road from Salt Lake City south, via Utah Lake and the Sevier and Virgin rivers, to Callville, at

the head of navigation on the Columbia river; and for a road from Ogden north to the Columbia river.

The Montana Central R. R. Co. desire Congressional aid for their road from Corinne or Carter, by Henry Pass, to the head of the Madison, and down this river to the Gallatin Valley. Aid is also requested for the Cheyenne, Iron Mountain and Helena, from Cheyenne, Wyoming Territory, to the Iron Mountain, to Fort Fetterman, along the eastern or north-eastern base of the Big Horn Mountain, to the Yellowstone River valley, to Helena.

Nevada, having obtained legislative permission to construct narrow gauge roads, is determined apparently to have quite a number. The *White Pine News*, of the 8th, reported a surveying party already at work on the proposed road from Elko to Hamilton. The *Eureka Sentinel* thinks it very possible that the road from Palisade to Eureka will be finished by next September. The survey is to be commenced immediately.

A road from Mill City to Unionville, Humboldt County, 20 miles, will be built, we are told. The survey for the road between Reno and Virginia City was commenced February 24th. Special franchises have been granted to all these narrow gauge roads, and hereafter the gauge is not limited for other roads. The *Carson Register* says that steps are being taken to continue the Virginia and Truckee R. R. from Carson to Reno, via Washoe.

Colorado is getting impatient at the delay in building certain roads which are required to develop the resources of various rich sections. The Georgetown people have held a meeting and appointed committees to endeavor to secure a road as soon as may be possible. The Central City papers are working for a road to their place. The Boulder Valley road is complete from Hughes Station (on the Denver Pacific) to Erie, 15 miles, and the grading on the continuation to Boulder, 13 miles, is to be completed, according to the *Boulder News*, by July 1st. Work is being done on the Denver and Rio Grande. The Central City *Register* contains a letter from Mr. Luebbers (who has been reconnoitering a route for a road to connect Clear Creek and Gilpin counties with the plains), which favors a line up Ralston Creek. As to the question of broad or narrow gauge, Mr. L. states that the narrow gauge will cost less than one-fourth what the broad gauge would.

FIRST SHIPMENT OF COAL.—The first cargo of coal ever shipped from the Lake Washington Coal Company's wharf, says the *Alaska Times* of February 26th, is now being loaded into the bark Moneynick. She will take on two hundred tons. This has the appearance of business.

DEMAND FOR GUANO.—We are pleased to learn (through Geo. F. Silvester, 317 Washington street, who deals in the article) that the demand for guano is increasing in this State, and we hope it will be still more generally tested.

WARE'S COMBINED STEAM CARRIAGE AND ENGINE.

will give satisfaction, and all hitbert made are reported successes. Further particulars may be obtained by addressing Elijah Ware, San Francisco.

Railroad Matters.

Work is being pushed most rapidly on the Northern Pacific. On the eastern end three thousand men are said to be employed, and the first division, from Duluth, on Lake Superior, to the Red river, 223 miles, will soon be finished. On the western end, 700 men are employed and Kalama is exceedingly lively. We hear of shipments of materials for the road every now and then. Work at Puget Sound will be commenced soon. The Yellowstone route will be followed (*New Northwest*) but between the Yellowstone and the Columbia all is uncertain.

Concerning the Oregon roads, we have a number of reports and rumors. The Willamette Valley R. R. Co. has filed a map of their route from Portland to Forest Grove and thence south to McMinnville, with a branch northwest toward Astoria. The Oregon Branch Pacific Railroad contemplates a route from a point on the Central Pacific Railroad at or near Winnemucca, Nevada, by way of Goose Lake, Sprague's river and Klamath, across the Cascade range of mountains in the vicinity of Diamond Peak, to the navigable waters of the Columbia river, in the vicinity of Portland, Oregon.

At a recent meeting at Portland, it was resolved that a road ought to be built from that city through the Columbia gap of the Cascade range, by way of Eastern Oregon and Southwestern Idaho, to some point of

suggestion has been made, but no definite steps have yet been taken, as far as known.

The Central Pacific surveying party are still at work on the short route from Sacramento to San Francisco. The *Contra Costa Gazette*, of the 11th, reports them as being on the route from Bay Point to Moraga Valley.

The San Lorenzo Valley R. R. Co. was incorporated on the 11th. A road is to be built from Santa Cruz up the Lorenzo Valley and over to Santa Clara valley. The connection of San Jose with Alviso and deep water has long been talked of, and it is said that the California Pacific intend taking hold of the project.

The Stockton and Copperopolis road has been pushing forward. The first passenger train was run as far as Petersburg, 14 miles, on the 22d ult. Ten miles out of Stockton is Holden, from which place it is proposed to run a branch, 23 miles long, to Lone city, Amador county. The matter is being earnestly agitated.

The citizens of Antioch sent out, early in February, a party to survey a route from Antioch to Visalia, Tulare county. The party reached Visalia on the 10th inst. The route surveyed is stated as almost an air-line from Antioch to Watson's Ferry, on the San Joaquin Slough, and thence pretty direct to Visalia. The grade is given as very easy.

The Central Pacific company is reported as about to recommence work on the San Joaquin Valley road, which has stopped at Modesto. There are rumors that it will reach Bear Creek within three months.

After all the modifications and delays, the southern trans-continental railroad plan has assumed a definite shape in the Congressional bands. A bill has finally been passed providing for a main trunk (the Texas Pacific) from Marshall, Texas, along the line of the 32d parallel, to San Diego. The eastern end will have branch connections to New Orleans and other points. The western end will have a branch from Fort Yuma up through San Diego, San Bernardino and Los Angeles counties

DOMESTIC ECONOMY.

Fretting, a Habit.

"Fretting," says the *Herald of Health*, "is one of the silliest, most unnecessary, unchristian, unreasonable, unprofitable, undignified, unpleasant and useless things in the world. It never does any good; but always does harm to the one that frets, if no one else. Fretting is a habit, and may either be inherited or acquired."

The effects of fretting are quite as serious upon the individual who frets, as upon those with whom he comes in contact. It cramps and belittles the mind, and diseases the body of the unfortunate possessor of the habit; and however pleasant other surroundings may be, it brings disquiet and unhappiness into every household where it finds admittance. Although it often intrudes into the more public walks of life, its most sure and safe retreat is within the precincts of the household. There it works its direst effects, producing dyspepsia, nervousness and unnumbered forms of diseases upon the individual, and brings unhappiness, discomfort and numberless trains of evil to all who compose the household. And perhaps there is no other peculiarity so surely transmitted to posterity as this, especially when the habit is fixed upon the mother.

Fretting is too often regarded as the result, rather than the cause of disease. As already stated it is a habit, whether acquired or inherited; and like all other habits can be effectually broken up, if the sufferer can only apply his will firmly to the work. We know of no better rule for accomplishing this than the one assigned in the journal from which we have already quoted.

"The subject must do the greater part of the work. He or she must first be convinced of the folly, uselessness, and sin of the thing, and fully determine to conquer the detestable habit, and then whenever anything irritable occurs, KEEP THE MOUTH SHUT, and think of the folly and sin of giving way to the fretting proclivities until the irritated feeling has ceased.

The persons coming most nearly in contact with the victims of this habit can also do a great deal to aid them in overcoming it by kind and encouraging words, and by carefully refraining from saying or doing anything likely to induce the feeling of fretfulness."

SALT IN THE HUMAN SYSTEM.—Prof. E. Johnson, of Scotland, says: Upward of half of the saline matter of blood (58 per cent.) consists of common salt; this partly discharged every day through the skin and kidneys, the necessity of continued supplies of it to the healthy body becomes sufficiently obvious. The bile also contains soda (one of the ingredients of salt) as a special and indispensable constituent, and so do all the cartilages of the body. Stint the supply of salt, therefore, and neither will the bile be able properly to assist digestion nor the cartilage be built up again as fast as they naturally waste. It is better to place salt where stock can have free access to it, than to give occasionally in large quantities.

Dressing Frogs for Food.

A LETTER from Florence Italy, contains the following:—This morning I wandered through the market, and, turning a corner, came suddenly upon a frog merchant, who was busy preparing and selling the little jumpers. On a table was a large bag, into which a boy put his hand and took out a number of live frogs; with a pair of scissors he decapitated them in rapid succession, at the same time cutting the skin of the back open, and then threw them into a large earthen dish which contained, perhaps a hundred more in the same state. Although headless, they were all swimming about and jumping in the liveliest manner. After soaking for a short time, they are taken out and dexterously skinned and then thrown into a tub of clear water. Even after being beheaded and skinned, some of them managed to swim around in the tub, and always tried to climb up the sides. They are sold by weight, and are cleaned, the feet cut off, and are ready for the purchaser, who no doubt enjoys them more than I could after seeing the whole operation of killing.

Cold Meals.

The greatest desideratum of a second-hand dish, so to speak, is that it should not taste as such. Nothing is more abominable than the bad taste which is so prominent in the attempts at warming up cold meat, which your plain cook is pleased to call minced veal, hashed mutton, etc. The only means to avoid that taste is to remove carefully from the cold meat you are going to use, every part that has seen the fire as well as gristle and fat. Let every slice be carefully trimmed, and let them all be as near as possible similar in size and shape; then make your hash, and, even if you are not an expert at combining sauces and spices, at any rate it will not have a warmed up taste. The following are various formulas for warming up mutton and others meats:

Cut an onion in slices and fry it in butter till it assumes a deep brown color, then put in a table-spoonful of flour, and when it is well amalgamated with butter, add a little less than half a pint of stock broth, or even water previously warmed. Stir a few minutes on the fire, and then proceed to flavor your sauce with walnut or mushroom catsup, tomato sauce, spices, and pepper and salt, in such proportions as taste may suggest and practice will teach. A little burnt onion browning may be put in if the sauce is not of a sufficiently deep color.

When the flavoring is completed, strain the sauce through a fine colander into a sauce-pan, and place in it your slices of meat. Keep the saucepan at a moderate heat till it is time to serve, and send your hash with a garland of bread sippets fried in butter around it. The longer the meat lies in sauce the better will your dish be. Proceed as in the above recipe as far as the butter, flour, and onions are concerned; then add to your sauce a moderate allowance of mustard; then add the stock, with or without a little white or red wine. Season with catsup, spices, pepper, and salt. Strain and put in the meat, serving with pickles or not, according to taste. Beef and pork are best warmed up in this way.

A mode of warming cold meat is in this wise: Fry some slices of onion in butter, and when they begin to take color put in your slices of meat, pepper, salt, and a sprinkling of flour. Keep on frying till the onions are thoroughly done and the meat warmed, then add a small quantity of stock broth, or water, with a small quantity of vinegar and serve.

Forks and Sawmills.

A curious juxtaposition, the reader will say; but we have introduced them here as illustrative of the popular clamor which almost always attended the introduction of improvements and inventions, in the ordinary ways of labor and life, when inventions first began to find their way into the industries and amenities of society.

Forks were first known in Italy toward the end of the fifteenth century; but it was a hundred years before they came into use in France, and nearly a hundred more before they had traveled as far northward as Scotland. Their introduction into England was at first ridiculed as a piece of affectation and effeminacy. In one of Beaumont and Fletcher's plays, "your fork-carving traveler" is spoken of with great contempt, and Ben Johnson, also joined in the laugh against them.

The first man who appeared with an umbrella in the streets of London drew down upon himself a pelting shower of mud and stones, which was worse than the rain against which he had spread the new-fangled protection.

So with sawmills.—The old way of making boards was by splitting up the logs with wedges; and, clumsy as the method was, it was no easy matter to persuade the world there was a better. Sawmills were first used in Europe in the fifteenth century. In 1663 a Dutchman built one in England, but the public outcry against it was so vehement that he was obliged to decamp; and, for the next hundred years, no one ventured to repeat the experiment. In 1768 a rash adventurer began to erect another mill, but a conservative mob gathered at once, and tore it down.

AN INDUSTRIOUS WOMAN.—Mrs. Jane Ellis, of Searsport, Me., 74 years of age, has woven 340 yards of carpeting from March 10 to November 24, besides making 200 pounds of salmon nets and weaving 200 yards of cloth. All this in addition to doing her house work, and taking care of a sick husband.

Domestic Receipts.

CHEAP FRUIT CAKE.—Take three cups of dried apples, soak over night; in the morning chop fine, add two cups of molasses, and cook slowly one hour; when cooled a little, add one cup of sugar, one of raisins, one of thick sour cream, two eggs, one tea-spoonful of soda, flour enough to make a stiff batter, season with cinnamon, cloves, nutmeg, and lemon to taste; bake in a moderate oven.

MOCK MINCE-PIES.—Six crackers pounded fine, one cup of molasses, one of sugar, one-half of butter, one-half of vinegar, one-half pound of raisins chopped, two eggs, and spice to taste.

WINE JELLY.—One box of Cox's gelatine dissolved in a pint of cold water, then add a pound of loaf-sugar, the juice and grated rind of three lemons; pour on to this a pint of boiling water and a pint of wine, add cinnamon and cloves to taste. Bring all to a scald, strain, pour into molds, and set on ice till it is wanted. To be eaten with meats.

FAIRY BISCUITS.—Rub two ounces of butter with half a pound of flour and four ounces of sugar, and a few drops of almond flavoring; mix with the white of an egg, and a table-spoonful of milk; work well into paste two ounces of sweet almonds well pounded and through a wire sieve; take up pieces the size of a half dollar, bake a few minutes on buttered paper, taking care to keep them a pale color.

SNOW-FLAKE CAKE.—Half a cup of butter, two cups of sugar, four of flour, one of sweet milk, three eggs, well beaten, one table-spoonful cream of tartar, half a tea-spoonful of soda—or if you have prepared flour use no soda or cream tartar. Bake the cake in shallow jelly pans; while baking, grate two fresh cocoanuts carefully, and spread over each cake, as it comes from the oven, a thin frosting, and then sprinkle thickly with the grated nut. Three layers of cakes make one cake. This recipe will make two loaves.

MOLASSES CANDY.—One tea-cup molasses, half tea-cup any kind of sugar, tea-spoonful vinegar, a piece of butter half the size of a nutmeg. Put the whole in a skillet on a hot fire, and boil exactly ten minutes, stirring it all the time. Then set off to cool. Pull it as soon as it is hard enough. Boiling it twelve minutes will make it too hard. Eight minutes will not be enough. Ten minutes by the clock is the exact time.

Mechanical Hints.

WHITE SHELLAC, when new, will very readily dissolve in the usual solvents, but on exposure to the air it is gradually changed in its character, and it seems almost impossible to dissolve it; in such cases it should be put away in the hottle or jar in a warm place, and in time it will thoroughly dissolve.

TEMPERING OLD FILES FOR CHISELS.—Heat the chisel gradually to a cherry red heat, then dip in water about one inch of the chisel end till it comes to a black heat, then rub with a rubber till you see a blue color, then quench it directly. This is the way blacksmiths do them.

ANOTHER WAY.—Grind out the cuttings on one side, and you will have a bright surface, then damp the surface with a little oil; then lay the file on a piece of red-hot iron, bright side upwards. In about a minute you will see the bright surface turning yellow; and when the yellow has deepened to about the color of straw, plunge in cold water.

TOOLS IN THE WORKSHOP.—Of all tools in the workshop whether of the amateur or of the practical man, the absence of the grindstone would be most severely felt, without it the restoration of the edges of tools would be scarcely possible, and upon their perfection much of practical success of cutting processes depends. Sharp tools produce, with the least expenditure of time, surfaces so nearly finished as to require but very little polishing; whereas blunt tools leave lines and mouldings less accurately defined, and the additional friction or polishing employed to gloss over the defects makes a bad case worse, and obliterates all the keen edges that would impart to the work a defined or exact character.

SEASONING WOOD BY BOILING.—Small pieces of non-resinous wood may be perfectly seasoned by boiling four or five hours. Sash frames of Spanish chestnut which has been so boiled have been "wedged up" within six weeks after the tree was felled, and have stood to admiration. The boiling takes the sap out of the wood, and most hard wood so treated shrink one-tenth in the process.

Life Thoughts.

The crown of all real manliness, of all Christian manliness, is purity.

"GRANDEUR of character," says Channing, lies wholly in force of soul.

To be very attractive to all sorts of different people, one must have great readiness of sympathy.

HEAVEN-GATES are not so highly arched as Princess' palaces; they that enter there must go on their knees.

POSTERITY is able to be impartial, and restores the too great admiration of contemporaries to the proper degree.

NATURE has written a letter of credit upon some men's faces, which is honored wherever presented.—*Thackeray*.

In youth, women are our idols; at a ripe age, our companions; in old age, our nurses, and in all ages, our friends.—*Bacon*.

AN APT ANSWER.—Said one man to another: "If it wasn't Sunday, how much would you take for all that lumber?" If it wasn't Sunday I'd tell you.

It is not until the flower has fallen off that the fruit begins to ripen. So in life, it is when the romance has passed that the practical usefulness begins.

Most of the successful men are healthy men or were so at the time the foundation of their fortune was laid. To get rich requires health, and to keep and enjoy a fortune it is even more important.

HAVE the courage to show that you respect honesty, by whomsoever exhibited.

Have the courage to wear old clothes until you pay for your new ones.

Have the courage to obey your Maker, at the risk of being ridiculed by men.

Have the courage to prefer comfort and prosperity to fashion in all things.

Character is Power.

It is often said that knowledge is power, and this is true. Skill or faculty of any kind carries with it superiority. So, to a certain extent, wealth is power and genius has a transcendent gift of mastery over men. But higher, purer, better than all, and more constant in its influence, more lasting in its sway, is the power of character—that power which emanates from a pure and lofty mind.

In any community, who is the man of most influence? To whom do all look up with reverence? Not the smartest man, not the cleverest politician, nor the most brilliant talker; but he who in a long course of years of prosperity and adversity, has neighbors, who have seen his life, and all of whom pronounce him worthy to be called wise and good.

In any society when a difference of opinion arises on matters of little or no consequence, it is wise to give in, although you may have incontestable proofs to support the correctness of your opinion; this flatters the other's vanity, and cannot injure yourself.

"THIS little fellow," said Martin Luther of a bird going to roost, "has chosen his shelter, and is quietly rocking himself to sleep without a care for to-morrow's lodging; calmly holding by his little twig, and leaving God alone to think of him."

THE things that belong to man must be understood, in order that they may be loved; the things that belong to God, must be loved in order to be understood.—*Pascal*.

"FOR MYSELF" said the great Spinoza, "I am certain that the good of human life cannot lie in the possession of things which for one man to possess is for the rest to lose but rather in things which all can possess alike, and where one man's wealth promotes that of his neighbor."

NEVER be sorry for any generous thing that you ever did, even if it was betrayed. Never be sorry that you were magnanimous, if the man was mean afterward. Never be sorry that you gave. It was right for you to give, even if you were imposed upon. You cannot afford to keep on the safe side by heing mean.

THERE is no royal road to learning, the scholar must be content to tread upon each round of the ladder if he would reach the top, remembering "that which is easily gained is little valued."

For my part, says Hawthorne, if I had an insupportable burden; if, for any cause I were bent upon sacrificing every earthly hope as a peace offering toward Heaven, I would make the wide world my call, and good deeds to mankind my prayer. Many penitent men have done this and found peace in it.

Substantial Success Based on Merit!

THE

IRON WORLD AND MANUFACTURER

IS PUBLISHED WEEKLY AT

Pittsburgh, Pa.

AND IS THE LEADING—IF NOT THE ONLY—REPRESENTATIVE JOURNAL OF THE METAL TRADES PUBLISHED IN THE UNITED STATES.

Located in the very centre of the metal interests of the United States, with offices and correspondents at the leading cities in the East, West and South, we do not err in claiming that it is the REPRESENTATIVE JOURNAL of the Metal Manufacturers, Workers and Dealers of this country.

THE IRON WORLD AND MANUFACTURER has a large and extended circulation throughout the United States, and is taken by Iron and Steel Manufacturers, Machinists, Founders, Hardware Dealers and Timbers, Gunsmiths, Plumbers, Cutlery Manufacturers, File Manufacturers, Saw Manufacturers, Boiler Manufacturers, and by

Leading Railway Officials.

It advocates protection to American Manufacturers. Its markets are full and reliable. If you are a manufacturer, take the journal that advocates your interests. Don't patronize Free Trade journals, but help those who help you.

With Free Trade the manufacturers of this country would be ruined. English gold is scattered with a liberal hand to further Free Trade. Expend some of yours to favor Protection.

If you advertise, which is the best medium? Circulation being equal, which would you patronize—a Free Trade journal or a Protection journal? Circulation is considered the value of an advertising medium. Much depends on the character of the circulation. The New York Weekly Tribune claims 200,000 circulation, and gets from two to five dollars per line for advertising. The Iron World reaches more people engaged in the metal business than the New York Tribune. Our rates are about ten cents per line. Which will pay the best? Sample copies mailed Free. Address

IRON WORLD PUBLISHING CO.,

Special attention is called to the

FURNITURE WAREHOUSES

OF

George O. Whitney & Co.,

Nos. 317, 319 and 321

FINE STREET, SAN FRANCISCO.

The largest and most complete stock on the Pacific Coast. At Wholesale and Retail. 8v213m

The U. P. R. R. and the Interior Mines.

We clip the following from the report of the President of the Union Pacific, presented at Boston on March 8th:

The increased facilities opened by the railroad for reaching the mining districts have greatly stimulated the development of the mines. Colorado and Utah are now opening some of the richest mines yet discovered in our country. The mines in the vicinity of Salt Lake are exciting great attention. It is estimated that from ten to fifteen thousand settlers and miners will be drawn there the ensuing season. The amount of ore to be sent over our road to smelting works East and to England, is estimated to be from five to ten thousand tons daily, while machinery and supplies necessary to develop successfully and profitably the mines, will give a very large westward business to our road. Our prospects of business from Salt Lake City and vicinity are very encouraging, and I shall be greatly disappointed if it shall not be more than double what it was last year. Our coal mines have proved fully equal to our most sanguine expectations, both in regard to the superior quality of coal as a steam generator and the extent of the deposit. It is believed that there is no better coal in this country for locomotive service, and nowhere can it be more cheaply mined. Iron ore of very superior quality and in vast quantities has been discovered in the vicinity of Cheyenne and Laramie. We have promise of an iron district here that will be able to compete successfully with the most favored localities of our country. Extensive iron works must spring up on the line of our road, and we shall be furnished with cheap iron for all its uses. Coal and iron, the most necessary and essential materials for the construction and operation of railroads, are found on the line of our road in unlimited quantities and of the finest quality.

PAPER CAR-WHEELS.—The Pullman Car Company is running a car, on the Chicago and North-Western road, with what are called "paper wheels." The wheels have steel tires and cast-iron hubs, and the paper is introduced in the way of filling under the tires, for the purpose of deadening sound and diminishing the force of concussion. According to the *National Car Builder* the wheels have been running since July last. The paper is said to be superior to wood for the purpose, being stronger and lighter, and free from knot-grain, or sap. It does not expand or contract, but remains in the condition in which it is put in. It is cheaper than wood, and can be molded into any form by pressure.

GRAY SQUIRRELS.—The Los Angeles *News* says that a couple of gray squirrels, with bushy tails, and apparently identical with those found in "the States," were killed a few days since, near that city. It is believed they are the first, of the kind observed on this coast. The *News* adds "There is a species, however, found among the pine trees on the mountains in California which, though almost identical in appearance with the squirrel of the Western and Southern States, yet differs from it in the possession of a well-formed clavicle or collar bone. Those recently killed by our friends may have been of this species, which is supposed to be the only one of the squirrel family possessing such an anatomical peculiarity."

COAL MINING at Golden, Colorado, says the *Transcript*, is progressing with more activity than usual. The Hazelton company, besides the regular work upon the mines near the pottery, have men at work in opening mines at two points north of the creek. In one shaft they have a fine body of coal of excellent quality. Here they are sinking for the purpose of working several levels at the same time. Some 300 yards south of this, alongside the railroad grade, they have sunk a shaft to the coal, and are drifting.

The great demand for our new paper has entirely exhausted our copies of the early numbers; we have constantly to inform new subscribers that we cannot furnish the full numbers now without breaking up our regular files, a limited number of which we have for bound volumes.

SAN FRANCISCO MILLIONAIRES—There are thirteen men in San Francisco worth over a million each. When dollars come to be counted Michael Reese can count sometime after the others have exhausted their resources.

Constitution and By-Laws of the Bureau of Mines and Mining Statistics of the Pacific Coast.

ARTICLE 1.—This association shall be known as the Bureau of Mines and Mining Statistics for the Pacific Coast. The Bureau shall be constituted by the election of one delegate from each county in the States of California, Nevada, Oregon, and such other States and Territories as may elect to send delegates to the annual convention. The affairs of the Bureau shall be conducted by a Board of seven Directors, three of whom may be the legal representatives of foreign nations, accredited to the United States, and residents on the Pacific coast.

ARTICLE 2.—The officers of the Bureau shall be a President, Vice-President, Secretary, and Treasurer, who shall be elected from the members of the Board of Directors. The Directors shall be elected at the annual meeting of the Bureau, which shall be held on the second Tuesday in September in each year; and they shall hold office until their successors are elected and qualified. The Directors, when elected, shall, within twenty days thereafter, meet and organize by the election of officers of the Bureau for the ensuing year.

ARTICLE 3.—The object of the Bureau shall be to establish a source of correct and reliable information to foreign and domestic capitalists, and other persons who may desire to obtain information respecting mines and mining property, and thereby furnish a channel for the investment of capital, and encourage the development and working of valuable mines on the Pacific coast.

ARTICLE 4.—The business of the Bureau shall be conducted by a Board of seven Directors, three of whom may be the legal representatives of foreign nations accredited to the United States and resident on the Pacific coast. And it shall be their duty, when requested so to do, to examine or cause to be examined, the title and character of all mining property that may be laid before them for that purpose, and report the same; which report shall be entered upon the books of the Bureau.

ARTICLE 5.—The Board of Directors shall cause hooks to be opened by the Secretary for the registration of mines, and parties desiring to register mines, shall, over their own signature, properly witnessed, furnish a statement of the locality of the mine or mines, the title to the same, the character of the ore, and the kind of mineral it contains, the number of shares or feet in the same, whether incorporated or not, and if so, where and in what State or Territory, the amount of and kind, if any, of the improvements thereon, the distance from transportation by water or railroad to San Francisco or New York, and such other information as the Board of Directors may require.

ARTICLE 6.—The Board of Directors may hold their meetings as often as the President may deem best for the interests of the Association. Notice thereof shall be given at least ten days previous to such meeting by depositing a written notice addressed to the Directors severally, in the postoffice or express office, provided that upon the written application or request of four members, the President shall call a special meeting, giving not less than five days notice of time and place.

At any meeting four members shall constitute a quorum for the transaction of business.

ARTICLE 7.—The President shall preside at all meetings of the Board of Directors and shall give the casting vote in case of a tie. He shall also approve and endorse all reports on titles, documents, and examinations of mines and papers relating to mines or mining property, which a majority of the Board of Directors shall have first approved.

He shall also, in conjunction with the Secretary, or other officer appointed by the Board, employ a mining expert, or mining engineer to examine the locality and mining property and report thereon, when requested to do so by any party who has caused to be registered in the book kept for that purpose, any mine or mines, provided the party requesting such examination shall deposit a sum of money sufficient to pay the necessary expenses for that purpose, with the Secretary. He shall also approve and countersign all bills, checks, or orders drawn on the Treasurer.

ARTICLE 8.—In the absence or inability to attend the meeting of the Board of Directors for any cause, by the President, the Vice President shall be charged with all the duties, and have the same power as the President.

ARTICLE 9.—The Secretary, shall attend all meetings of the Board of Directors, and keep a record of their proceedings, in a

book provided for that purpose, and also, receive, register, and carefully file and preserve, all copies of titles, records, documents, reports and papers deposited in the Bureau for examination and reference, and enter the name of the party who deposited the same, in a book provided for that purpose.

He shall also keep an accurate account of all moneys paid for registering and filing copies of titles, records, documents and papers in the Bureau, and receipt for the same to the party paying it. He shall also deposit all money with the Treasurer, taking his receipt for the same. He shall also draw all orders or checks on the Treasurer, entering the same in a book to be kept for that purpose, which with all other hooks, papers and documents, shall be carefully preserved, and open to the inspection of the Board of Directors at all times during the business hours of the bureau, and he shall perform such other duty as the Board of Directors may prescribe.

ARTICLE 10.—The Treasurer shall receive all money's belonging to the bureau, and pay them out upon warrants signed by the Secretary, and countersigned by the President of the Board of Directors.

The Directors may adopt such by-laws and rules for the government of the Bureau as they may deem necessary to the objects and interests of the association. The by-laws and rules adopted by the Bureau may be altered, repealed, amended or changed at any meeting, by a vote of six of the members of the Board of Directors.

Rules and Regulations.

RULE 1.—Parties registering mines or mining property, shall be required to furnish the Secretary with a true copy of the record of the mines or mining property, as recorded in the office of the Recorder in the district in which said mining property is located, or of the County Recorder, as the case may be, which shall be registered in a book kept for that purpose in the office of the Bureau.

RULE 2.—Parties desiring mining property examined under the direction of the Board of Directors and a report thereon, shall deposit such sum of money as the Board of Directors may determine to cover all actual expenses of such examination and report, a copy of which shall be furnished, properly certified to by the Secretary, to the party or parties making the application, and the original report shall be entered in a book kept for that purpose by the Secretary.

RULE 3.—The Board of Directors shall employ only such persons to examine any mining property as are known as mining experts, or mining engineers, and no report shall be received where it shall be made to appear that the parties making the examination have any interest directly or indirectly in the property examined by them.

RULE 4.—No Director of this Bureau shall take part in the examination or adoption of a report thereon upon any mining property in which he may be interested.

RULE 5.—The Board of Directors may fix such fee for registering mining property, as they may deem proper and just.

J. BERRON, President,

E. P. HUTCHINS, Secretary.

SILKWORM EGGS.—The stock on hand is greater than can be fed in this State; for our mulberry men have turned everything into eggs, neglecting the make of silk. The war in Europe has shut up our only market. This may be a benefit; for it will compel us, now, to turn our attention to making silk, which will be a permanent industry; while the sale of eggs would be, at best, of only limited duration.

In Japan there is also a surplus of eggs, for the same reason. A large consignment from that country is expected here, in a few days, and it is intended to induce all mulberry men to supply themselves, by low prices, and every manner of accommodation; including taking pay in the issuing product of cocoons. The eggs are consigned to James H. Van Read, and they are under government stamps, certifying the quality to be superior.

We may mention here that James Dale Johnston has ready for the press, a complete treatise on silk making; giving detailed instruction, which is very much wanted.

HEATING RAILROAD CARS.—A Berlin engineer has invented an apparatus for heating cars by means of chemical reagents. Experiments on the Berlin-Potsdam Magdeburg road, according to the *Arbeitsgeber*, showed the practicability of the plan, and the apparatus is to be introduced there.

Meteorological Observations.

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D.
Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N. Long. 121° 29' 44" W. Height above mean low tide, at San Francisco, 74 feet. Height of lower surface of mercury, 34 feet. The amount of cloudiness is designated by figures, 10 being entire cloudiness; 5, half cloudiness; 0, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 0 being a calm, 1 a very light breeze, and 10 a hurricane. The means are derived from three daily readings at 7 A. M., 2 P. M., and 9 P. M., in conformity with the arrangements of the Smithsonian Institution.

*Thermometograph. *Rain.

REMARKS.—Saturday, Feb. 18, 1871.—The weather has been variable and more or less stormy or cloudy during the whole week—not one single entirely clear day presenting. Although the rain has not exceeded a sprinkle, still the tendency continues (at the present writing, March 19, 11 A. M.) and we see no reason for modifying the opinion expressed in our remarks last week. The same comical causes which have delayed the rains in the southern part of our continent, doubtless affect us also; and the result will be, here as well as there, late but sufficient rain.

PACIFIC COAST INCREASE.—The census reveals the fact that the population of the Pacific Coast has increased fifty-eight per cent, in ten years. That does not look very much like retrogression, especially as New England, in the same period, only increased eleven per cent. By our mode of reckoning, that section of the country ought to be "gone in" indefinitely, but it is not; on the contrary, we believe that it is very well satisfied with itself.

LITTLE RHODE ISLAND is the first, and so far the only State which has responded to the Act of Congress requesting the several States to send to Washington statues of their most distinguished citizens. Rhode Island has sent two statues,—of General Greene and of Roger Williams.

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the PRESS. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21870 shows that our patron has paid his subscription up to the 21st of September, 1870; 4372, that he has paid to the 4th of January, 1871; to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

FOUR MONTHS' SUBSCRIPTION for \$1.—Subscribers to the PRESS who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper, or blank slip, WITHOUT the name and residence of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

SALT LAKE CITY.—Chan, Ricketts is agent in Salt Lake City and vicinity for the SCIENTIFIC PRESS and PACIFIC RURAL PRESS.

At the age of forty or thereabouts the eyesight requires the aid of magnifying glasses. Muller's Brazilian spectacles are acknowledged to be the best in use.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14720

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

E. J. FRASER, M. D.,

No 108 Stockton Street, S. F., Cal.

1000 Farms

In Los Angeles County.

For Cotton, Wheat, Corn, Grapes, Oranges, etc. The "Abel Stearns Ranch," 200 square miles in sections, quarter sections, etc., on Government system of survey, forming blocks one mile square, with road on each side, fronting on the ocean, the railroad to San Francisco to pass through them, the uncolored portions subdivided, for sale on long credit, or rent. The famous Anaheim is on this tract. For Maps, Circulars, etc., apply to E. F. NORTHAM, 432 Montgomery st., San Francisco, or TIMO. LYNCH, at Anaheim and Los Angeles. 1422-ams

LIST OF MINES IN OPHIR DISTRICT,
UTAH.

The following is a correct list of all locations made in this important district up to December, 1870:

THE
SCIENTIFIC PRESS.
FOR 1871.

Will be specially devoted to
Mining, Mechanic Arts, Inventions, and
Home Industries of the Pacific States.

PRINTED ON NEW TYPE,

AND ITS
READING COLUMNS INCREASED,
AND
Otherwise Improved in Value.

The success of our improvements in 1870, and the reduction of our subscription rates to \$4 per annum, resulting in a large increase of subscriptions, has induced us to make the above announcement.

CLUBS AT \$3 PER ANNUM
For each name, will be received when ten or more persons are included in sending us their cash in advance. Don't hesitate. Forward your own individual subscription. No one knows the real value of the Press until they read it. Use your copy of the paper to induce others to subscribe, (if you like it yourself), and in subsequent remittance for a club, we will allow you the difference first paid above club rates.

DEWEY & CO., Publishers.

Scientific and Practical
BOOKS

—ON—
MINING, METALLURGY, ETC.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.
Published and Sold by
DEWEY & CO.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurates, Arseniurates, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price \$2.50 coin, or \$3 currency, postage free.

For single copies of the above works, or for the trade, address
DEWEY & CO.,
Publishers and Patent Agents, Scientific Press Office,
San Francisco.

NEW 7-30 GOLD LOAN.

Safe! Profitable! Permanent!

JAY COOKE & CO.

Offer for Sale at Par and Accrued Interest the

First Mortgage Land Grant Gold Bonds

OF THE

NORTHERN PACIFIC R. R. CO.

These bonds are secured, first, by a First Mortgage on the Railroad itself, its rolling stock, and all equipments; second, by a First Mortgage on its entire Land Grant, and we will send back Northern Pacific Bonds at our own risk and without cost to the investor. For further information, pamphlets, maps, etc., call on or address the undersigned, or any of the Banks or Bankers employed to sell this Loan.

The Bonds are free from United States Tax; The Principal and Interest are payable in Gold—the Principal at the end of Thirty years, and the Interest semi-annually, at the rate of Seven and Three-Tenths Per Cent. per annum.

They are issued in denominations of \$100, \$500, \$1,000, \$5,000 and \$10,000.

The Trustees under the Mortgage are Messrs. Jay Cooke, of Philadelphia, and J. Edgar Thomson, President of the Pennsylvania Central Railroad Co.

These Northern Pacific 7-30 Bonds will at all times, before maturity be receivable at Ten Per Cent. Premium (or 1-10), in exchange for the Company's lands at their lowest cash price.

THE

ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street. 16v21-4f

THE WILSON
Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patent, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

STEAM JET PUMP.

Blakeloe & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber. E, F, are the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. B, a valve and pipe to introduce water under the lubricator for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel to provide a full supply of clean and pure water for the election of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and G. 1618-4f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Front Street, San Francisco.

PAIN KILLER
PROP.
PERRY DAVIS & SON, PROVIDENCE, R.I.
1840 1870

The PAIN KILLER is by universal consent allowed to have won for itself a reputation unsurpassed in the history of medical preparations. Its instantaneous effect in the eradication and extinction of Pain in all its various forms incident to the human family, and the unsolicited written and verbal testimony of the masses in its favor, have been and are its own best advertisement.
The ingredients of the PAIN KILLER being purely Vegetable, render it a perfectly safe and efficacious remedy taken internally, as well as for external applications, when used according to directions. The stain upon linen from its use is readily removed by washing with alcohol.
This Medicine, justly celebrated for the cure of so many of the afflictions incident to the human family, has now been before the public over THIRTY YEARS, and has found its way into almost every corner of the world; and wherever it has been used, the same opinion is expressed of its medicinal properties.
In any attack, where prompt action upon the system is required, the Pain Killer is invaluable. Its almost instantaneous effect in relieving Pain is truly wonderful; and when used according to directions, is true to its name, a PAIN KILLER.

2v21-1f

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

Number 13.

Boiler Feed Regulator and Low Water Alarm.

The necessity of some such device, for the sake of safety, as that here illustrated ought not to exist. That it does, however, in practice, is attested every day. The device is useful, moreover, not only for the sake of safety, but also for economical reasons, and hence its adoption is to be urged.

The machine, Berryman's automatic boiler feed regulator and low water alarm, depends for its action upon the weight of water contained in a metal globe outside the boiler. The construction of the apparatus is such that it does not require the nice adjustment necessary in many devices for the same purpose, but is simple and, at the same time, apparently most reliable. Its merits can be judged of from the following description. The highest testimonials are given. Fig 2 shows the boiler-feed regulator. In this form of the machine, pipes, *c* and *a*, connect the interior of the globe, *B*, with the interior of the boiler; the end of the pipe, *a*, called the discharge pipe, descending below the low-water line, and that of the pipe, *c*, descending to this line. It is evident if the air contained in the pipes and globe, *B*, be allowed to pass through a pet-cock in the top of the globe, and the boiler be filled to the proper level, that, as soon as steam is raised in the boiler, water will be forced up along the pipes, *a* and *c*, by the accumulating pressure of steam, and fill the globe, *B*.

This globe is suspended on one end of a counterpoised lever, *L*. As soon as it is weighted with water, it overbalances the counterpoise, *H*, which rises. This action operates, by means of *e* and *h*, to close or partially close a valve in the steam pipe which supplies the pump, thereby checking the action of the pump and stopping the flow of water into the boiler. As soon, however, as the water in the boiler lowers through evaporation so that the end of the pipe, *c*, is uncovered, steam enters this pipe, and the water in the globe, *B*, descends by its own gravity to the boiler. The counterpoise on the lever, *L*, now overbalances the weight of the globe. The lever, *L*, oscillates to the original position, operating through the lever, *h*, to open the valve in the pipe, letting the steam into the steam cylinder of the pump, and setting the latter into action to supply water to the boiler again. As soon as the water now rises to close the mouth of the

pipe, *c*, steam no longer enters this pipe. The steam in the globe, *B*, condenses, and the pressure of steam in the boiler again forces water up the pipes, filling the globe, which again descending cuts off steam from the pump and checks the supply of water to the boiler. In this way the supply of water is constantly regulated within certain limits depending altogether upon the position of the counterpoise on the lever, *L*, which may be set so that the globe will descend when only partially filled with water, if such action be found desirable.

The regulator can be applied to any kind of boiler. The manufacturers assert that it will, in most boilers, allow not over one-eighth of an inch variation of

though it does not cause explosion in such boilers, does cause great loss of time and money. Several boilers fed by one pump, can be regulated by a regulator on each boiler.

Fig. 1 shows another modification, whereby a whistle, *O*, is sounded by opening of its valve through the medium of the chain, *M*, and the lever, *N*. This occurs whenever the water falls below the mouth of the pipe, *B*, and continues until the water rises enough to cover it.

The manufacturers say: In using the regulator, it must be borne in mind that we are not responsible for the

water not being kept at its proper level, if by any means the pump should draw air or break down, or the water supply

must act separately, and with them on any boiler it will be impossible to have low water to a dangerous extent if the alarm is heeded.

The manufacturers will be pleased to receive an order from a responsible house for one of each device for trial, which can be made at their risk and expense, if not entirely satisfactory. Agents on this coast are wanted. For further particulars, address R. N. Pratt, Secretary and Treasurer Berryman Regulator and Alarm Company, Hartford, Connecticut.

COLORADO DEEP PLACERS.—According to the *Colorado Miner*, attention is being gradually turned towards the deposits of pay gravel found in various parts of that Territory. These deposits, although not rich in the general acceptance of the term, can yet probably be made to pay well with the proper methods. River mining in such streams as the Blue and Swan, in Summit county, the Platte and its feeders, in Park county, and the Arkansas and its tributaries, in Lake county, must soon commence.

GOLD REFINING BY CHLORINE.—We have previously noticed the introduction of the Miller process at the Philadelphia Mint. The *Jour. Franklin Institute* says that very satisfactory results have been obtained. A bar of some 500 ounces, containing antimony which rendered it very brittle, and 780 fine, was refined in 1½ hours to a fineness of 997 and made perfectly tough, every trace of antimony having been removed. The impure gold is melted in a crucible previously saturated with melted borax, and having a layer of fused borax over the metal. The gas is generated in a stone-ware vessel, and led by a flexible hose to a pipe-clay tube, by which it is carried to the bottom of the metal. All the chlorides of antimony, tin, etc., are volatilized away, the silver chloride is retained by the layer of borax and panned off after the gold has become solid in cooling. This chloride is cast in flat plates and arranged in a box or frame, with alternate layers of zinc coupled as for a galvanic battery.

The whole being immersed in water, a galvanic action is set up, the reduction is soon finished, and the silver is so compact and free from zinc that it is ready for the melting pots.

AN INTERNATIONAL EXHIBITION will be held in London, commencing on the first of May.

Fig. 1. LOW WATER ALARM.

Fig. 2. BERRYMAN'S AUTOMATIC BOILER FEED REGULATOR.

water level. Consequently it saves a large amount of fuel—keeps the boilers from the constant expansion and contraction incident to the usual method of feeding, and directly and indirectly, by these means, would prevent many of the explosions that are constantly taking place. It is a safeguard against the constant burning of boilers, by the water getting low, which,

by any means be cut off; but we do guarantee the regulator to do its duty, if properly used, as any machine must be to perform its functions. But suppose the water supply should be cut off, or the pump break, etc., etc. If the low water alarm is connected at a lower level than the regulator, it will notify promptly of the accident to the pump. The two machines

MECHANICAL PROGRESS.

PNEUMATIC MAIL TUBES.—The following description is from Gardiner Greene Hubbard's late memorial on the subject of postal telegraph: "Twelve of the principal offices in Paris are connected by these tubes. The carrier consists of a brass box, shaped like a clock weight, placed inside a tightly-fitting case of hard leather. After many experiments this form has been found the best adapted for the service. The messages are placed with addressed envelopes in the carrier, together with a list, showing the number and destinations of the messages. The carrier stops at every office on the route, that messages may be taken out and others put in. Each office is furnished with a Morse instrument and line wire. There is one main circuit 21,497 feet in length, two secondary, 17,350 feet and 16,617 feet, and a branch line 3,712 feet, making a total of 59,182 feet, or eleven miles. "The trains" start from the central station every 15 minutes, and make the circuit in about 14 minutes, stopping at five offices. In London two methods have been adopted: one consists of a circuit or continuous tube leading from the central telegraph office to the general post office, and back to the starting place; the other of single tubes leading to separate offices. These tubes are of lead, about one and a half inches in diameter, and are enclosed in iron pipes for protection. The carrier is a small cylinder of gutta percha, covered with cotton. Two, or even three, are sent at the same time. The transit occupies about one half a minute through the longest tube, 3,600 feet in length. A constant movement of the carriers is kept up in the circuit in both directions; they are placed in a loop of the main pipe, which is closed, and a valve opened into the main pipe, and by the same movement a column of compressed air is let in behind the carrier, which propels it through the tube into a similar loop at the other office. Another carrier can at the same time be sent from the other office, the air being exhausted from the tube. The single tubes are operated in the same way. The carriers are sent by pressure, and returned through a vacuum. One engine only is required, which is at the central office."

HIGH SPEED FOR WOOD-WORKING MACHINERY.—The *London Engineer* for February 24th, gives notes of a visit by invitation to the works of Messrs. Allen Ransome & Co., Chelsea. We quote: "Messrs. Ransome & Co. have for some time past adopted a principle of construction which is almost peculiar to themselves. It consists essentially in driving all their wood-shaping machines, and many of their wood-cutting machines, at an excessively high velocity. Thus the fly cutters of the moulding machine, which we illustrated in a former impression, run at not less than 7,000 revolutions per minute when the machine is going at full speed; and the reciprocating screws of a new double deal frame make 450 double strokes per minute. The fact that such high speeds can be maintained for hours at a time without the heating of a bearing, or the failure of any portion of the apparatus is the very best proof that can be produced of excellence of design, material, and workmanship. These excessive speeds are only practicable when the machinery is the best that it is possible to make. The slightest want of truth in the fittings or lack of balance in the rotary portions of the mechanism would very quickly bring the whole machine to grief. It is certain, therefore, that if the cutters of a general joiner or a moulding machine can be run at 5,000 or 7,000 revolutions per minute for even an hour without heating or breaking down, the whole machine must be thoroughly sound and good."

LOCOMOTIVES AND ROAD STEAMERS IN NEW JERSEY.—The *Artisan* of March 15th says the Grant Works, at Patterson, are turning out ten of Thompson's road steamers per month. Of the Rogers' Works, it says:—"At present, the works are in full blast, with a force of over 900. For the last few years from 120 to 150 engines per annum have been turned out, and at the present they are building from 12 to 15 a month." The Danforth works employ between 600 and 700 men, and turn out six or seven locomotives monthly, in addition to a large amount of cotton machinery. For this last they have a large order from Mexico.

TEST OF THE ALLEN ENGINE.—The *American Artisan* for March 15th has advanced sheets of the report of experiments made at the late Fair of the American Institute, to determine the economy and effective power of this engine. We quote the result:—"The coal burned for the Allen engine, divided by 52.36 per cent. of the power exerted by the steam, gives a quotient that is just the mean of those obtained by dividing the coal burned for the Corliss and the Babcock & Wilcox engines by 66 per cent. of the power exerted in them; and the coal burned in each case, divided by the total power exerted, shows a consumption, for the Allen engine, of 1.5 lbs. per horse-power per hour, against a consumption of 1.87 lbs. for the Babcock & Wilcox, and of 1.9 lbs. for the Corliss engine. This economy is believed to be without precedent, except in cases where steam has been expanded in two or more cylinders, and reheated on the passage." In speaking of the results as thus reported to them by the superintendent, the judges—comprising Dr. F. A. P. Barnard, Robert Weir, and Thomas J. Sloan—use the following language:—"The performance of this engine (the Allen) has exceeded that of the two fine engines which were on trial here last year. The results seem to be without precedent in such engines. The engine ran from eleven to twelve hours repeatedly without showing a sign of a warm bearing, displaying thorough perfection in all its parts. In all respects, the engine is first-class, and from the fact of its presenting weight with speed as a requisite for perfection in steam engines, it has opened a new era in this necessary branch—its economy having been clearly demonstrated in the careful trials, which ought to be published in full."

EXPRESS LOCOMOTIVE FOR THE GREAT NORTHERN RAILWAY.—*Engineering* for Feb. 24th describes an engine with proportionally larger cylinders than ever before constructed, built for the above named road, and now so satisfactorily proved that several more of the same sort are building. We quote:—"This engine has outside cylinders 18 inches in diameter with 28 inch stroke, and the driving wheels are 8 feet 1 inch in diameter. Taking the diameter of the driving wheels with the tyres half worn, as 8 feet, the tractive force which the engine is capable of exerting will be 108 lbs. for each pound of effective pressure per square inch on the pistons, an amount nearly one-third greater than that of the engines formerly described by us. The stroke, namely, 28 inches, is longer than that of any passenger locomotives with which we are acquainted, and this length of stroke enables a high speed of piston to be maintained, notwithstanding the large size of the driving wheels. In fact, when the engine we are describing is running at a speed of 60 miles per hour, the piston speed is as great as that of the 7 feet wheel engines, when running at a speed of 61¼ miles per hour."

IRON TENDER FRAME.—The *Chicago Railroad Gazette* of March 18th describes the iron frame for tenders patented by Mr. Healey of the Rhode Island Locomotive Works. It is of channel iron with lateral braces riveted thereto. Mr. Healey writes that a frame of this kind will weigh about 1,000 lbs. less than an ordinary wooden frame of the same size, and he claims that they are not only lighter but more durable than frames constructed in the ordinary manner, either of wood or iron, but cost less. They have been tested in a number of collisions, and have in all cases, not only sustained little or no damage themselves, but have saved the tank from injury. "Some of the New England roads are replacing their wooden tender frames with iron as fast as they need renewal. Two hundred and fifty of them are now in use."

IRON SMELTING AT OMAHA.—The foreman of the Union Pacific R. R. Co.'s shops has devised a furnace which dispenses with the blower. The *Omaha Herald* says "the new furnace has about half-way up a steam supply-pipe, that introduces into the interior of the flue about a dozen jets of steam. This steam creates a vacuum that draws the blast through the live coal below with tremendous velocity; securing by such simple means the intense heat necessary for smelting the metal. The new furnace has been running now about two weeks, and is so great a success that several more are to be constructed, and the old furnaces entirely abandoned. The iron ore of the Black Hills will be smelted upon the spot. It yields a heavy percentage of superior metal, and coal is abundant."

SCIENTIFIC PROGRESS.

EFFECT OF LIGHT AT DIFFERENT SEA-DEPTHS.—An instrument for testing the depth to which the actinic rays of light can penetrate, devised by Mr. Siemens, was recently tested in Gibraltar Harbor by Dr. Carpenter. The action of the sea water upon it, however,—increased as it was by the galvanic current arising from the contact of iron and brass in the mechanism,—interfered in some degree with its working, and it is to be reconstructed and again tested. We copy a description of it:—"The foundation of the apparatus is a horizontal wheel with three radii, each of them carrying a glass tube in which a piece of sensitised paper is sealed up. The rotation of this wheel round a vertical axis brings each of the tubes in succession out of a dark chamber in which it ordinarily lies, exposes it to light in an uncovered space, and then carries it into darkness again. This movement is produced by a spring; but it is regulated by a detent that projects from the keeper of an electromagnet, which is made and unmade by the completion or breaking of a circuit that connects it with a galvanic battery. When the magnet is made, it lifts the keeper with its projecting detent; and this allows the wheel to be carried by the spring through one-sixth of its rotation, whereby the first of the tubes is brought out into the open space. There it remains until the circuit is broken, whereby the magnet is unmade; the keeper then falls, and the wheel is allowed to move through another sixth of a rotation, so as to carry on the tube into the dark chamber. A repetition of the making and unmaking of the magnet brings out the second tube, and shuts it up again; and another repetition does the like with the third tube. This apparatus, with a deep sea lead attached to it, is suspended by an insulating cable that contains the wires whereby it is connected with the battery in the vessel. Being lowered down to any desired depth, the circuit is completed, the magnet made, and one of the tubes exposed for as long a time as may be wished; the circuit is then broken, the magnet unmade, and the tube shut up again. The second tube may be exposed for a longer time in the same place, or the apparatus may be lowered to a greater depth, at which the experiment may be repeated; and the third tube may then be dealt with in like manner."

IMPROVEMENTS IN MICROSCOPES.—Dr. Royston Pigott has been experimenting for some years upon this subject, and has during the past year published some account of his researches. We give a paragraph from an article by "E. R. L." in a late number of *Nature*:—"Dr. Pigott found the usual means of testing an object-glass by trying if it gave some particular appearance with a 'test object,' such as the Podura-scale, very unsatisfactory, since we have no certainty to begin with as to what is the true appearance of such an object. He therefore examined minute images of objects of which he knew the true form, such as a watch-face or thermometer-scale, forming these images by aid of mercurial globules, and the condenser properly adjusted below the microscope-field. By this means he has found that object-glasses corrected so as to show dark, sharply marked spines (like ! ! !) on the Podura-scale—a favorite test-object with our microscope-makers—give false, blurred and distorted appearances with his known images, and on making such corrections of the objective as to show the known images in their true form, he finds that the Podura-scale, examined with the corrected objective, is not really marked at all, as supposed, but is beset with a series of bead-markings, which by intersection, when improperly defined, give the curious appearance like notes of exclamation. This important discovery of the falsity of our high powers (one-eighth to one-sixteenth) has led Dr. Royston Pigott to pay more attention to the lower powers, and he finds that though you may not get so much actual amplification, you yet get a truer effect, and greater clearness of detail, by employing very carefully made low powers (one-second to one-fifteenth) and increasing the magnifying power at the other end of the microscope, i. e., the eyepiece. We have in this way seen the beaded structure of the scales of Podura more satisfactorily than with very high objectives, even when corrected so far as they would admit, and we may say the same of some Diatom-valves e. g., *Pyl. formosum*. It would be most important to know how far such a change of combination would be useful in histological work."

NEW FORM OF MAGIC LANTERN.—At a late meeting of the Polytechnic Club of the American Institute, Prof. Morton,—says the *N. Y. Engineering*,—exhibited a new arrangement of the magic lantern, adapted to the exhibition, upon a vertical screen, of horizontal objects, making it possible for large numbers of persons to witness at once phenomena which heretofore it has been impossible to show. The rays from the lime-light pass horizontally through two condensing lenses, then strike a mirror at an angle of 45°, and pass directly up, where they pass through the object, resting immediately upon the last part of the condenser. After passing through the objective they are again reflected by a mirror at an angle of 45°, and pass horizontally to the screen. Heretofore it has been customary to have the first reflection after the rays leave the condensing lenses, the result being that they make a long cone, and by the time they reach the objective, are not in a fit condition to throw an image on the screen. A squire prism will not answer for a reflector, for all the rays will not strike it at such an angle as to be totally reflected, and the consequence will be that one side of the field will be in the shade. The lantern being adjusted, Prof. M. illustrated its use. Placing a small magnet upon the condenser, and above it a glass plate, covered with a thin layer of iron filings, by tapping gently upon the glass, the particles were seen to arrange themselves in symmetrical curves around the poles of the magnet. He next showed the motion of the waves. By projecting air through a minute nozzle upon the surface of the water in a circular vessel, the waves were shown to be reflected from the edge of the vessel. Placing the nozzle one side of the center, the interference of the waves from the opposite sides was shown. Substituting for the circular vessel of water one of elliptical form, the effect of the form was shown, forming various caustic curves, and if the point of impulse was at one focus, showing the meeting of the waves at the opposite focus. Various cohesion figures were also shown.

DARWIN ON CONSCIENCE.—To undeceive those who suppose Darwin an atheist, we give an extract from George Ripley's review of his new hook in the *Tribune*:—"Whatever judgment may be pronounced as to the tendency of Mr. Darwin's views of the origin of man to humble the natural pride of ancestry, we ought not to lose sight of the fact that no philosophical writer of the present day sets forth a more exalted conception of the actual faculties and endowments of the race as developed under the highest forms of moral and religious culture in the progress of civilization. He almost goes out of his way to do justice to the ideas and beliefs which have been regarded by the wisest thinkers in every age as the crowning glory of humanity. In this respect, his system presents a favorable contrast to the shallow, sensualistic, French philosophy of the eighteenth century, which resolves the most refined sentiments of our nature into fleshly illusions. 'The question,' says Mr. Darwin, 'whether there exists a Creator and Ruler of the Universe, has been answered in the affirmative by the highest intellects that have ever lived. I fully subscribe to the judgment of those writers who maintain that of all the differences between man and the lower animals, the moral sense or conscience is by far the most important.'"

THEORY OF GLACIAL MOTION.—Our readers will recollect the notice of Mr. Croll's theory that glaciers descend by the action of heat upon the molecules of the ice, loosening them momentarily from their cohesion, and allowing them to be re-arranged under the influence of gravity; the motion therefore being of molecule by molecule, rather than in mass. Of this Mr. Alfred Wallace remarks in *Nature* for Feb. 16th:—"It seems very doubtful if this theory is more tenable than the one it is intended to supersede. If heat entering the glacier loosens the molecules in its passage and enables them to move insensibly into new positions, it is difficult to understand what causes the numerous longitudinal and transverse fissures of a glacier, the production of which is often attended by loud reports, and which indicate movements of masses, not of molecules. And how could molecular motion lead to that heavy grinding of the ice over its bed, which scores and wears down the hardest rocks, and whitens great rivers with the finely triturated mud?"

CORRESPONDENCE.

The San Diego Mines.

[Written for the Press.]
Julian District.

In the Julian Mining District (San Diego county), a great number of claims have been recorded, and new discoveries have been made, almost weekly. Those showing the most work done, and the largest yield of gold, are the Owens, Helvetia, Washington, California, Hayden, Van Wirt, Good Hope, San Diego, North American and Stonewall Jackson. Near the latter, on the Cuyamaca grant, prospectors for placer claims have found considerable quantities of float quartz, which has paid wages for working. The Helvetia is the widest ledge and is worked without blasting; it has yielded, without sorting the quartz, twenty to twenty-five dollars per ton. The Hayden, Owens and Washington have given the highest yield, the two former reaching about fifty dollars per ton, and the latter as high as one hundred, at the mills in the district, but this yield was from carefully sorted lots. The first lot worked in San Francisco from the Washington yielded over four hundred dollars per ton. This was the cropping of a rich streak. Another rich streak, fifty feet from the first, has been discovered, and traced sixty feet below the surface, with a dip almost the same as the first. Without including these "streaks," a run on the ledge has paid over twenty dollars to the ton, and other ledges about the same. The country rock in the Washington is harder than in the others, except the San Diego, and hence has required a greater expenditure of time and money for the same amount of work. Nearly all the mines named have shafts down fifty to seventy-five feet. The veins continue without material change, except showing more sulphurets and indications of silver, the walls as a rule becoming more obstinate, and developing into a sort of iron rock—iron and quartz predominating in it. Two quartz mills are in operation, although neither are doing first-class work. Another has been dragging its slow length along, its owners learning at the most expensive school—experience. There is a prospect now that it will hold out better things to the district. Six to eight dollars per ton have been the prices for milling.

Bauner District.

The first mill, erected by James McMechan of San Francisco, who has become the best abused man in that vicinity, was removed last winter to the San Felipe cañon. This is now known as the "Bauner District," one thousand feet or more below the altitude of Julian, and four miles east. The ledges are probably the eastern extensions of the Julian veins. The Redman ledge was the first discovery in that locality, and six claims, of one thousand feet each, have been located on it. The Antelope, Atlantic cable and others in the district, are also good mines. By the arastra process, several hundred dollars to the ton have been taken from different claims, the rock doubtless more or less culled. The first yield of the Redman at the McMechan mill was about fifty dollars to the ton. Chester Gunn, of San Francisco, the amalgamator at this mill, has introduced some improvements in saving the gold, which make it by far the best appointed mill in either district.

A five-stamp mill of rude structure was also in operation here, a three-stamp mill in process of erection, and some half-dozen arastras doing good work. The watchword seems to be, "on to the desert," as "rich mines" have lately been discovered three miles east of the Redman, and more recently some still east of those. "India's golden sands" may come home to the Colorado plain after all.

The mines in Bauner District have a greater alloy of silver with the gold; hence the lullion is worth some two dollars less per ounce than that from the mines west of the summit at Julian. Though the permanency of the ledges is established, their full development must await more skill and capital. These wait on a change of ownership, which itself waits on the faith which moves the hand that holds the money. "S."

Bull Run District, Nevada.

[Written for the Press.]

EDS. PRESS.—Notwithstanding the cold and snow, mining operations have been carried on throughout the winter to a greater extent than was previously thought possible. This has resulted to the advantage of the owners of claims and will induce the more speedy erection of mills here. We have now sufficient ore on hand to keep a 10-stamp mill running for eight months.

The Nevada company have just tapped their ledge (at a depth of 100 feet) after running a tunnel 125 feet long. The ledge is from four to six feet wide and shows better ore than that obtained at the surface. The boys have thousands of tons of \$100 to \$250 rock and could supply a mill with 10 to 18 tons daily. The Johnson company are taking out very good ore from their mine. J. F. Chellis has out the Rising

highest point would be at least 1,000 feet lower than the summit now crossed in going to Mountain City.

BULL RUN MINER.

Bull Run, March 5, 1871.

A People On Stilts.

In the low lands of France, to the south of Bordeaux, and especially in the "lands" of Medoc, is found a curious race of people, mostly shopkeepers, with many fishermen along the sea shore, who have adopted the curious custom of almost universally employing the device known as stilts, as a means of locomotion. Men, women and children are all alike accustomed to this style of going about. The children soon become so accustomed to it as to know no fear, and the women employ it as generally as the men.

The pictures of Rosa Bonheur have made the reading public quite familiar with the

A SHEPHERD OF MEDOC ON STILTS.

Sun, at a depth of about 120 feet, with a tunnel 230 feet long, and has found the ore better at this depth than at the surface. He will run in the tunnel 160 feet further, at which point it will tap the Monument ledge. Other claims are being worked with favorable results.

While not wishing to boast concerning our mines, we think we can say with truth that no district in this State can show better prospects than ours for the work performed. We refer for proof to the returns from ores shipped to the Anhorn Mill, Reno, and elsewhere.

One great inconvenience of our place is that we have no direct mail hither, notwithstanding the fact that a petition, signed by over 500 men, has been sent to the Post-Master General asking that a post office be established here; also that a stage route be established from Beowawe, on the C. P. R. R., running through Tuscarora, Independence and Bull Run to Mountain City. This would be a more level and better winter route, and no longer, than one direct from Elko to Mountain City, while it would accommodate the above-named places. The road would at no season of the year be covered with over 12 inches of snow, while that from Elko has sometimes in winter from three to five feet, and its

singular habits of the people of those countries. The first time that a group of these singular people is seen by the observer, a curious emotion comes over his mind, as of a strange prodigy. When they first came in sight, near the horizon, and are gradually lifted into view, they look much like gigantic crickets creeping slowly along, or making preparations for a spring. As they are observed near at hand, stepping listlessly about, handling with the utmost address the long stick which they use for a balancing pole, when they are moving, and as a rest for the arm or person when they are not in motion, they present a truly curious and unique appearance.

The individual herewith represented, has dropped his satchel and canteen by his side, and taken his seat on the end of his balancing pole, while his faithful shepherd dog sits by his side, waiting for the word of command to gather up the sheep, if they stray too far. He has taken out his knitting work, which is always carried about by the shepherds, with which to make the most of their leisure hours, and is busily plying his needles, while his eyes are constantly cast about over the plain, watching the movements of his flock. As you approach, you will notice that he is dressed in well-worn sheep skin garments with

flaunting hat, well calculated to shade his neck and face from the sun, or shed the water when exposed to the falling rain. Take him altogether, he is about as curious a looking human as one will meet with in traveling the wide world over.

Family and social groups of these weird-looking beings are often seen in great numbers congregated on the sea shore, the old men and women and children watching the fishermen as they are hauling or setting their nets.

The origin of stilts is unknown, but it is probable that they were not in use before the middle ages, as ancient authors make no mention of them. In the language of the country we have described, they are called *chaque*, which would seem to fix their origin in the period of the rule of the English, deriving it from our word shank. Probably some inventive English mind gave them this serviceable mode of progression.

Perched on these borrowed legs, the shepherd watches over his charge, concealed, perhaps, in the brushwood, or crosses uninjured the marshes and quicksands, with no fear of being torn by thorns or dry twigs; while he can at any time double the speed at which he ordinarily walks. The women, who are invariably dressed in black, look like large ravens perched on dead branches. Whether this singular habit of locomotion has any effect on the character, cannot be decided; but certain it is that these people are distinguished by their wild, savage nature. They have a horror of strangers; and when they perceive a traveler coming toward them, they hasten to flee into concealment.

NOTES OF TRAVEL IN CALAVERAS AND IN TUOLUMNE.—In the communication from "L. P. Mc," published March 18th, a typographical error occurred. The pressure of the water at the Alexandria mine should have been given as 340 feet. The superintendent of the Gwin mine is Mr. Wm. M. Gwin, Jr. In the letter published March 4th, the name of the superintendent of the Confidence mine should have been given as L. Gilson, instead of L. Gibson.

The Gates of Puget Sound.

The Pillars of Hercules, on which swing the gates of inlet and outlet to the Mediterranean sea, are but the posts of a wicket compared to the gigantic portals of De Fuca. The width of the entrance is fourteen miles. The northern gate-post, Cape Bonilla, is the seaward buttress of a range of mountains, some of which are 6,000 to 7,000 feet high. They are covered with fir trees to the summit. Cape Flattery, the headland on the south, is a wonder that men in the various sections of the United States should travel around the globe to see. It is the termination of the snow-clad Olympic range. Where it breaks down into the ocean, it is a perpendicular wall one hundred feet high, of jagged, contorted rock, a conglomerate of boulders of basaltic heath-sand, round cobble-stones, and pebbles, solidified into the hardness of adamant. The material presents the resistance of flint. But a force of nature in some far-back age cracked, broke, and deranged it, as a man with the grip of his fingers would splinter an army biscuit. Immense blocks stand detached in every position. Down beneath them the sea has for centuries been drilling and boring into the rock, and has made vast and deep grottoes, and arches, and colonnades, into which the tides ebb and flow, and where the seals live and love and raise families of baby seals, and where violet-colored cormorants, petrels, guillemots, harlequin ducks, and muros make nests and make music of a deliciousness that money cannot buy. And, unparalleled beauty, all around this gate-post of the entrance to Puget Sound, in white foam, down into the sea, descend cascades of water from the summits of the cliffs. Lichens and mosses grow on the rocks, above the swell of the waves. From the upper tide-levels down, hang fringes of sea-weeds in the greatest variety and the utmost profusion. Above these are hanks of blue flowers, which in great patches change the jagged rocks into soft blue sky.—S. Wilkeson in the Christian Union.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, March 18th: The Schenectady Co. are examining the Whelpley & Storer furnace, with a view to its use in the mill to be built. The mine is turning out good ore.... Good ore is coming out of both upper and lower tunnels of the Monitor & N. W. mine, and men will be put at work on the additions to the mill next week... The crushing and concentrating machinery of the Glohe work well, and the furnace will start up on Monday.

AMADOR COUNTY.

THE ZELLIE MINE.—*Ledger*, March 25th: At last, after sinking to the depth of five hundred feet, the "black gouge" has been struck and a decided improvement is perceptible in the ore. Another contract is to be let to sink the shaft one hundred feet deeper.

CALAVERAS COUNTY.

MINE SOLD.—*Chronicle*, March 25th: Lewis & Bros., of the "Big Mine" near Railroad Flat have sold it to parties in San Francisco, for \$25,000 in gold coin. There is no hump about this, no waiting for the "money to come out of the claim" or anything of the kind. The mine and terms of conditional sale have been referred to. The prospective purchasers advanced \$2,500 to develop the lead, reserving the right to buy or not as they saw fit.

PALOMO.—We understand that the mine is paying \$12,000 per month regularly.

EL DORADO COUNTY.

HART.—*Placerville Democrat*, March 25th: This mine is said to be paying well whenever water can be obtained. The proprietor has had an offer of one hundred dollars per month for a lease of five years, payable monthly in advance, which he has not yet decided to accept.

GOOD.—We understand that parties are now here to commence work on the Harmon mine, and again start the mill.

DITCH.—Mr. Poett, of San Francisco, acting for English capitalists, has been in this section looking to the practicability of bringing in a large ditch, and the probability of such an enterprise being remunerative.

PROSPECTS ON THE GEORGETOWN DIVIDE.—The mining interests, both quartz and placer, are beginning to improve. The St. Lawrence, (Doran) mine, has been purchased by San Francisco capitalists, who took possession on the 18th, and are prospecting with vigor. They work six hands two at a time night and day, in eight hour "shifts." We are informed that these parties pay fifteen thousand dollars for this ledge, making one payment down and the balance in 90 days, if the claims suit them; if not, they forfeit the first payment and surrender the mine to its former owners. From present appearances it is not at all probable that this enterprise will prove a failure.

THE DEFIANCE Hydraulic Claim, on the Perkins Ranch, owned by parties from San Jose, is energetically worked. The owners have purchased Mr. Perkins' Ranch, and laid down between two and three thousand feet of iron pipe to convey water to their works.

INYO COUNTY.

CERRO GORDO.—*Independent*, March 18: Beaudry's works are shut down, for the purpose of adding a new galamadre. Belshaw's in full blast, as usual. Work resumed on the Buena Vista tunnel by the new owners, Belshaw & Beaudry, and is producing large quantities of galena. On the Belmont side, the mine is working a force of eighteen men, extracting twenty tons of silver ore per week, of the average worth of \$100 per ton on the dump. Work on the lower tunnel, now in 640 feet, has been suspended for the present, and they are examining the ledges already cut by it. The Wittkind tunnel is in 170 feet, and being driven ahead as fast as possible, but the rock is very hard, and costs \$54 per foot to cut it. The Crowning Glory is proving fine property for its new owners. Eighteen men are employed, who are steadily taking out large quantities of pay ore. Hahn has made a new strike—the Schiller, and is extracting considerable quantities of good ore. The Oceola tunnel is in 200 feet, but has not yet reached the ledge. The Omega starting into the hill southward from the San Lucas canyon, just over the divide, is in 780 feet, and driven at the rate of 20 feet per 24 hours.

SALE.—Mr. Brady, for the Owens Lake Silver-Lead Co., yesterday purchased of

Mr. Thomas Parker's attorney in this place the remaining 200 feet in the Front mine.

MARIPOSA COUNTY.

PURCHASE.—*Gazette*, March 24th: Mr. Peter Wiant has brought the McAlpine mine on Quartz Gulch, five miles from Coulterville, and has put a force at work to put the mine in working order. The mine was once famous as one of the richest in the county and has yielded a great amount of treasure. It is on the great mother lead.

NOT MUCH.—The damage done to the Washington mine, near Hornitos, by the caving two weeks since, was not as bad as reported.

RESUMED.—We learn that work was resumed on the Malvina mine last Monday and the French mill will soon be crushing the rock.

PAYS WELL.—Mr. J. Shimer has been working his mine near Coulterville all winter with good results. At present he has a vein of 2½ feet in thickness of good paying quality.

MONO COUNTY.

THE DIANA MINE.—*Reno Journal*, March 25th: The ore has been a puzzle to metallurgists, and the mine has paid but little more than expenses. Mr. Williams a few weeks since determined to give the Stetefeldt furnace a trial and accordingly mined out nine tons of ore and shipped the same to the Auburn Mills here for reduction, which was worked this week and yielded over \$750 per ton.

NEVADA COUNTY.

BLUE TENT.—*Gazette*, March 22d: All the mines are actively worked, and water since Monday has been abundant. Killam & Co. are using 750 inches through a five and a half inch nozzle, under a pressure of 230 feet. At the head of their claims their pipe is three feet in diameter. This leads into 22 inch pipe, and after running 500 feet, it is compressed into 16 inch pipe, and then forced through one of Craig's glohe nozzles.

YOU BET.—Same of 25th: We learn that the prospects for mining this season are brightening. There will be a good supply of water in a few days.

THE CORNISH MINE.—Within a few days rich pay had been struck in the Cornish mine, a mile and a half down Deer creek. The mine has been worked three years and has cleared above all expenses, \$30,000. Two shutes have been exhausted, and the owners had about given it up, when they struck the richest pay 500 feet from the second shute. The claim was purchased by the present owners in 1859. There is rich quartz enough in this shute to last six or seven years. There are 80 tons of quartz above ground, and the owners are taking it out at the rate of 10 tons per day.

THE RAIN FALL.—*Transcript*, March 22d: The last was, according to the gauge of the South Yuba Canal Co., 1.93. This gives a total for the season up to date, of 36.01 inches, against 46.32 inches to the same date last season.

Same of 25th says the demand for water is greater than all the ditches could convey if they were running full. At Scott's Flat also the miners want more than the companies can furnish. In many of the camps the miners alternate, some of the companies working in day time and others at night.

EUREKA MINE.—*Grass Valley Union*, 21st: The Eureka did not spread herself in the last two weeks. The mill lost half a day in that time, on account of repairs. Eleven and a half days' run gives \$22,000.

NUGGET.—Same of 28th: The Webster Co. had a clean up Saturday. A curious nugget, weighing an ounce and a half, picked up out of the sluice boxes, represents in shape the design on the Seal of the State of California. The Goddess of Liberty, with cap and staff, is sculptured in gold, by the hand of Nature. An imaginative eye can see outlines of the bear at the left hand of the Goddess. This specimen is to be saved from the melting pot.

PLACER COUNTY.

ENORMOUS YIELD.—*Stars and Stripes*, March 23d: Last week the St. Patrick Co., in Ophir District, made their first regular crushing since the last change of proprietors. One hundred and ninety-four tons of rock were crushed, yielding within a small fraction of sixty pounds of retorted gold, valued at about eleven thousand dollars. In addition to the above, the Co. sent below a lot of specimen rock—about half a ton—the value of which is variously estimated at from one thousand to twenty-five hundred dollars. Thus we have a test, by the crushing of nearly two hundred tons of rock, just as it came out—good, bad and indifferent—that shows an average of about sixty-seven and a half dollars per ton. Considering that the bottom of the shaft is

eighty feet below the water line, and that the rock at that depth is the best they have struck, the above must establish the reputation of the St. Patrick.

MINE SOLD.—*Herald* 25th: Baptist Stinger has sold his mine 1,000 feet on the Shipley ledge, for \$6,000 in gold coin. The shaft is down only 70 feet, but it has yielded richly and is a five foot ledge.

PLUMAS COUNTY.

PIPING.—*Quincy National*, March 18th: Nearly all the hydraulic claims in the county are now running, and the water season bids fair to be a good one.

CAVED.—The tunnel of the Deadwood Co., at Ellzabethtown, caved in one night last week. They have about repaired damages. They intend to run through to the back before commencing to "breast out." A large amount of gold will be taken from this claim during the summer.

RICH BAR.—Cor. of same: McElroy & Beatty are running a prospecting tunnel, opposite Long Bar.... Rice & McCorkle, at Oak Flat Ravine, have commenced piping. They will take out "big money." The Bunker Hill Co., have commenced with good prospects.... The Taylor Hill Co. between Smith's Hill and Bunker Hill, have a large head of water, and plenty of ground which prospects "big." They have just got their pipes to running.... Keep & Co., on Indian Hill, have commenced throwing water.... A new company has commenced ground sluicing in Kellogg's Ravine. The ground is deep, and has never been prospected.... McInness & Co., at French Ravine, are making good wages. Several large pieces have been taken from this claim, one weighing over sixty ounces.

SAN BERNARDINO COUNTY.

NEW DISCOVERY.—*Guardian*, 18th: Mr. James Grant, just returned from a prospect in our mountains, 35 miles southeast of Lane's Crossing, discovered seven ledges of rich silver, copper and galena, which he has sent to Los Angeles for assay.

SIERRA COUNTY.

SIERRA VALLEY.—Cor. of *Messenger*, March 25th: The miners at Antelope are steadily digging away at their ledges. Parties at Gold Hill interested by specimens sent them, offer to put up furnaces, etc., this spring for an interest in the mines.

ITEMS.—*Democrat*, March 23d: The Keystone Mill is again in full operation. Excellent rock is being taken from the mine.... The Reis Co. is putting on more men, and all the miners around Sierra City are employed.... We have been shown by Mr. Webe some rock from the ledge owned by Webe, Barton & Co., which is immensely rich.

WATER.—For the past week it has rained most of the time. The indications are that the miners have a good season ahead. The water is beginning to start in the ditches in the northern camps.

SISKIYOU COUNTY.

ITEMS.—*Yreka Union*, March 22d: Miners are busy at work now in all the different localities, generally in ground sluicing. Water is tolerably plenty for the present.... We learn that the miners on Dog Creek are doing well.... We understand that the quartz mill of Moses & Co., on Humboldt, has been started.

TRINITY COUNTY.

THE PROSPECT.—*Journal*, March 18th: There has been storm enough to insure a fair yield from the mines. We predict that more money will be taken out this season, than ever before with the same amount of labor and water. Our reasons are, that nearly all the claims are productive—the poorer ones being ones being unworked. Next, the miners have had abundance of time to rig. Further, the boys are generally hard up, and determined to make everything count. Gold dust is coming in freely already.

DOUGLAS CITY.—Charley Tourret cleaned up recently, after sixteen days' run, twenty ounces.

LOWER TRINITY.—Job Hedges & Co. have opened a claim abreast of Little Prairie, and found a good prospect and eighty feet of gravel. They have dug a ditch to their ground.

INDIAN CREEK.—Sillcox is reported to be in excellent spirits over his late clean-up, and will push ahead with the work on his quartz ledge. He is satisfied that he has a "big thing."

STRUCK IT.—Marcus Bennett & Co. have struck good diggings on a bench above Poker bar, and have a ditch from Trinity gulch on to the diggings.

MINERSVILLE miners were all at work, at last accounts, with a full supply of water and excellent prospects.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—The Elko *Independent*

of March 25th, gives an extract from a private letter:—"One of the richest strikes has been made here. Mr. Harris is the discoverer of the ledge, in which is contained a stratum of pure horn silver an inch and a half in thickness. The ledge is next to the Estelle. The Estelle has been purchased for fear that it might run into the new discovery. The name of the ledge is the Independent."

ELY DISTRICT.

A GOOD MINE.—*Record*, March 23d:—Charley Noakes and others, on the Alexander, a recent location, have a shaft down 60 feet and 30 tons on the dump, which will work three to four hundred dollars to the ton. They have a vein of ore two feet thick and widening. One assay went up to \$1,000 per ton.

FINE BARS.—At Cahill's office on Sunday, we saw sixteen silver bars belonging to Courtney & Co., the product of a portion of the ore from the Creole contract. It was all over .975 fine, and was worked at Ely & Raymond's five-stamp mill in the Valley. The bullion is valued at nearly \$30,000.

BULLION.—Since March 16th, one week, the shipments by Wells, Fargo & Co., from Pioche East, amount to \$42,222.57; West, \$929.86. Also, from the Meadow Valley Co., via Salt Lake, \$11,951.62; and by P. H. Feleenthal, \$2,078.

The Salt Lake *Herald* reports the receipts from Pioche, by W. F. & Co., for February, as 159 bars, weighing 16,989 pounds, or over eight tons, of \$226,776 coin value.

EUREKA DISTRICT.

WHAT IS DOING.—*Sentinel*, March 25th: The Richmond has never looked so well. Explorations prove that an immense body of smelting ore has been reached, and with eight men 20 tons of ore per day can be extracted, while neither the bottom nor sides have yet been reached. The late work on the Empire has discovered a body of ore larger and of high grade. The Hambrug is worked by six men, and they are raising 12 tons per day. The Marcelina deep shaft is in splendid ore. The Adams and Faren is producing large quantities of ore, and the work is being pushed with all hands. The Otho, now under bond, is producing fine ore. The Saratoga is improving. The Kentucky Boy and the Mountain Chief are producing more ore than can be melted in the furnaces of the Buttercup Co. The Home Ticket and the Dunderburg are showing fine ore, and the first is furnishing more than can be melted in the Tilton furnace.

THE JACKSON MINE.—This gave clear for January \$18,000, and nearly as much for February. But having been worked for months merely to get out ore, explorations were neglected, and it is now reported played out. But when the furnaces are repaired and work again commences, Jackson ore will make Jackson bullion as of old.

MILLS WANTED.—The latest explorations in the district show that there is a large proportion of the ores which are milling, rather than smelting, ores; and that there is now on the dumps within five miles, ore enough to run a 20-stamp mill a year. But the transportation to any mill within reach would cost \$10 per ton.

HUMBOLDT.

ITEMS.—*Silver State*, March 25th: The Butte mill at Rye Patch, is nearly ready for starting up again. Five stamps have been added, making ten. The Akin furnace has also undergone improvements.

...The amount of bullion shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$6,243.54.... The Batavia & Pacific Co., of Relief District, are to put up a mill soon; a large amount of ore on the dump is ready for it.... In the same district, Hadley & Walters have a 3½-foot ledge which tests \$96 per ton.

OREANA.—We understand that the Orea Smelting Works are shortly to be put in operation again. A joint stock company is being organized, with Almarin B. Paul as Superintendent of works and mines to be consolidated.

ARIZONA MINE.—Unionville Cor. of *Enterprise*, March 10th: The two mills can crush and amalgamate 400 tons a day. Average assay of ore milled, \$75 per ton. The first quality, which assays \$550, is shipped to Europe for reduction. The monthly dividend is \$30,000. A force is constantly prospecting ahead, and there is now, by calculation, sufficient ore in sight to supply 200 tons a day for three years.

REESE RIVER.

ORGANIZED.—*Reveille*, March 22d: The "Citizens' Mill Company" was organized at a meeting last night. The steps for incorporation will be taken to-day. Capital stock, \$50,000, in \$25 shares, unassessable. A force of men was dispatched to Ione this

morning to begin the work of taking down the mill.

PLENTY OF RICH ORE.—Same of 23d: Old Lander Hill is looking better than for two years. The Manhattan Co.'s mines are in better trim than ever. In the Oregon, at depth of 230 feet, a drift 130 feet long shows an unbroken face of concentrated ore. More or less rich ore is coming out of all the veins on the hill. We think Austin will be a live place from this on.

WAKING UP.—Same of 24th: The hills to the west and south of Austin, which for years have been desolation itself, are alive with men looking up old and abandoned locations, and posting fresh notices on the same. Recorder Craycroft has had more work to do within the last two weeks than in the past two years. Only well-defined ledges, known to pay in the fifties, are relocated. Now lot people work them or quit. The Citizens' is not a speculative concern. They will work ores cheap and well; but they won't buy or lease mines from people too lazy to work them themselves.

WASHOE.
CHOLLAR-POTOSI.—*Enterprise*, March, 26th: Daily yield increased to over 300 tons, principally from the Belvidere section. The floors promise to extend wider than those already worked. The yield of bullion is very large.

SAVAGE.—The ore product is 80 tons per day, from the old and new mines. Several levels are being reopened. It is expected that the south drift on the lowest level will connect with the works of the Hale and Norcross within two days.

HALE AND NORCROSS.—The ore-breasts between the seventh and eighth levels are yielding a large supply of excellent ore. We understand that a development of some importance has been made in this mine during the past two days; but we have not learned its locality. The daily product is 200 tons of ore.

BELCHER.—The quartz in the winze below the track floor of the 420-foot level shows improvement. The west drift shows more favorable indications, and the prospects of the mine generally are excellent.

YELLOW JACKET.—Daily yield 190 tons. The ore-breasts all yield well, and the new body being developed at the north portion of the drift at the 1,000-foot level will soon be cross-cut into.

CROWN POINT.—The huge ore body shows better and more extensive as developed. It is the finest body of ore of its size ever discovered in that section of the Comstock.

CALEDONIA.—The 200 and 300-foot levels yield 120 tons per day, keeping the Pinite and Sapphire mills running to their full capacity.

GOULD AND CURRY.—A vast amount of prospecting is being done, and we hear rumors of good ore being found.

IMPERIAL.—The cross-cut from the north drift at the 300-foot level into the Holmes ground, shows only quartz and porphyry but the indications are favorable.

VIRGINIA CONSOLIDATED.—Still cross-cutting west.

DANEY.—Drift in from the shaft 133 feet last evening. Rock favorable, allowing of better progress. Everything works finely.

LADY BRYAN.—We understand that the present owners of the Lady Bryan mine propose starting both mine and mill into full working operation in a few days. The whole concern is now in the hands of good substantial men, who own everything and do not owe a dollar on account of it. There is plenty of ore in the mine that will pay from \$17 to \$30 per ton.

WHITE PINE.

REVIEW.—*News*, March 18th: Live miners have been following up the narrowed strata in Chloride Flat mines pronounced "played out," and have in nearly every instance discovered large bodies of ore. The English Company steadily pushes on its works. The tramway will be finished by April 1st. The wire rope from the Ward Beecher mine to the Stanford mill has been put in place.

Same of 25th says that many claims idle during the winter, have been started up. The croakers have decamped, and the workers have come. The bowels of Treasure Hill are alive with men. It is now demonstrated that a true vein of ore extends from the Aurora South to the Original Hidden Treasure. The developments already made are sufficient to warrant the permanency of our camp, and to insure success to such companies as are working for it legitimately. A short time now will tell the story.

ITEMS.—South Aurora takes out 150 tons ore per day. Ninety men are at work in the mine. Silver Wave is in better shape than ever before. Thirty men are at work.

The pulp assay of a lot of ore worked recently was \$95 per ton. Three miners have struck a regular vein two to three feet wide. The ore struck in the Bourbon will mill \$100 per ton. The ore breast on the Mammoth is now 12 feet high and 40 feet long. The ore assays \$270, and shows chloride of silver. Work on the Burning Moscow and Sunbeam was suspended during the suit just decided in favor of the Sunbeam. Big Smoky furnace has never had to shut down for repairs yet. There is no burn out to it. There is 700 tons now broken in the Ward Beecher mine. In Genesee, a "horse" divides two vertical veins of ore, 3 and 5 feet in thickness. General Lee reverts to the owners April 1st. The lessees are hurrying up to set out all they can of the good ore on hand.

Arizona.

BRADSHAW.—The *Miner* of March 11th, says two-thirds of the Prescott people have gone daft over the rich ore from Bradshaw. A number of sales have been made. Fifty feet in the Tiger sold for \$2,000 cash down. Gid. Cornell offered Wash. French \$10,000 cash for his 300 feet, which was refused.

Same of 18th, says that the news daily received confirms all that has been said of the richness of these mines. Major Veil, just returned, says there are 150 men there at work with their pockets filled with specimens, showing chloride and native silver. The Tiger Co. were shipping ore from their shaft. The Del Pasco (gold), had a shaft down 66 feet, with richer ore than ever. Men were constantly arriving from points south, prepared for prospecting. More feet have been sold, but most owners prefer to hold on.

OTHER DISTRICTS.—Big Bug mill cleaned up the other day 40 pounds of gold worth \$16 per ounce. Lynx Creek has an abundance of water. The Vulture first extension have out rich ore, and will soon commence crushing.

Colorado.

NEVADA DISTRICT.—*Herald*, March 18th: The Mount Desert lode is yielding large quantities of remarkably rich ore. Hughes & Bird are working it under lease. The shaft is down 150 feet. The crevice has maintained a width of four to six feet of ore yielding per cord in stamp mill eight to sixteen ounces of gold, the last giving \$200.

SOUTH PARK.—Cor. of *Register*, 22d: At Mosquito, Hostetter and Co. are at work on the War Eagle lode. They have a vein of ore three to eight feet. This assays as high as two thousand dollars per cord in gold and silver. They are running it day and night, with five men.

REPUBLICAN MOUNTAIN.—*Miner*, 23d: The Silver Plume and Snowdrift are either of them equal in productive capacity to the Cariboo lode. These two mines can furnish 10 tons of ore per day and can yield, with 80 per cent. of the assay value paid, \$3,000 in silver bullion each twenty-four hours. They are well opened, and but very little of the ground in the stopes has been touched.

ITEMS.—The smoke is ascending from the Arey furnace. The Stewart Co. last week shipped silver bullion to the amount of \$5,282.95, coin, the product of six days' run of the mill. A rich strike has been made in the Gage lode, Republican mountain. The discovery shaft is only 14 feet deep. The Indigo lode, on Leavenworth mountain, is being worked on a lease. A lot of ore weighing half a ton, was sold to Stewart last week for \$516.38 currency.

Montana.

PILGRIM BAR.—*New North West*, March 17th: Operations begin on the Rock Creek Ditch, April 1st. The ditch will be flowed not later than April 20th, unless an unusually cold spell occurs. Last year water was not turned in until May 9th, and then only 400 inches. This year it will start with full 1,500 inches. All indications are in favor of the best mining season there has yet been at Pilgrim Bar.

Oregon.

The Jacksonville *Sentinel* of March 18th says the late rain will bring out over \$100,000 worth of gold from the mines in that county.

The *Oregonian* has the following:—Capt. J. H. Fisk showed us letters from Baker City, dated Feb. 19th and 22d, which give accounts of very rich discoveries of silver leads on Burnt river, between Miller's Station and Old's Ferry. There is great excitement at Baker City, and many are going up to look for feet. One of the parties interested had melted three ounces of rock, from which was obtained six cents worth of silver.

Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109, Post st.]
SAN FRANCISCO, Thursday, March 30.

SOLE LEATHER.—The demand is still equal to the supply, and prices firm.

City Tanned	25 @ 30
Santa Cruz	25 @ 30
Country	25 @ 30

CALF AND KIP SKINS.—The price of the war has made no difference in the price of French stock as yet, and probably will not. Domestic skins rule the same as heretofore.

Best French Calf Skins, 1/2 doz. 75 @ 100 57

Common French Calf Skins, 1/2 doz. 35 @ 50 75 00

French Kips, 1/2 lb. 1 00 @ 1 00

California Kip, 1/2 doz. 60 @ 70 00

California Kip, 1/2 doz. 1 00 @ 1 00

Eastern Wheel Stuffed Calf, 1/2 lb. 80 @ 1 25

Eastern Bench Stuffed Calf, 1/2 lb. 1 10 @ 1 25

Eastern Calf for Backs, per lb. 1 15 @ 1 25

Sheep Roms for topping, all colors, 1/2 doz 8 50 @ 13 00

Sheep Roms for Hinges, 1/2 doz. 5 50 @ 10 00

California Russet Stuffed Linings. 1 75 @ 3 00

HARNESS LEATHER, 1/2 lb. 30 @ 35 00

Fair Bridle, 1/2 lb. 30 @ 35 00

Skirting, 1/2 side. 4 50 @ 4 50

Wool Leather, 1/2 doz. 30 00 @ 50 40

Buff Leather, 1/2 foot. 25 @ 50 00

San Francisco Metal Market.

PRICES FOR INVOICES	
Shipping prices rule from ten to fifteen per cent. higher than the following quotations.	
IRON.—Duty, 1/2 ton: Railroad, 6c @ 100 lbs: Bar, 10 1/4 @ 11: Sheet, polished, 3c @ 100 lbs: 10 1/4 @ 11: Plate, 1 1/2 @ 11: Pipe, 1 1/2 @ 11: Galvanized, 2 1/2 @ 11: Scotch and English Pig Iron, 1/2 ton. \$34 @ 35 00	
White Pig, 1/2 ton. 32 @ 33 00	
Refined Bar, bad assortment, 1/2 B. 63 @ 64 00	
Refined Bar, good assortment, 1/2 B. 64 @ 65 00	
Boiler, No. 1 to 4. 64 @ 65 00	
Plate, No. 5 to 9. 64 @ 65 00	
Sheet, No. 10 to 13. 64 @ 65 00	
Sheet, No. 14 to 20. 64 @ 65 00	
Sheet, No. 21 to 27. 64 @ 65 00	
COPPER.—Duty: Sheathing, 3 1/2 @ 4 B: Pig and Bar, 2 1/2 @ 3 B.	
Sheathing, 1/2 B. 21 @ 22 00	
Sheathing, Yellow. 20 @ 21 00	
Sheathing, Old Yellow. 10 @ 11 00	
Composition Nails. 21 @ 22 00	
Composition Bolts. 21 @ 22 00	

TIN PLATES.—Duty: 25 per cent. ad valorem.	
Plates, Charcoal, 1X @ box. 12 00 @ 12 00	
Plates, 1 1/2 Charcoal. 10 00 @ 10 50	
Roofing Plates, 1 1/2. 10 00 @ 10 50	
Banca Tin, Slabs, 1/2 B. 42 @ 42 00	
STEEL.—English Cast Steel, 1/2 B. 15 @ 15 00	
Quenching, 1/2 B. 15 @ 15 00	
LEAD.—Pig, 1/2 B. 66 @ 67 00	
Sheet. 68 @ 69 00	
Pipe. 68 @ 69 00	
Bar. 68 @ 69 00	
ZINC.—Sheets, 1/2 B. 10 1/2 @ 11 00	
BOLAX. 25 @ 25 00	

New York Metal Market.

[CORRECTED WEEKLY FROM THE AMERICAN ARTISAN.]

NEW YORK CITY, Saturday, March 11, 1871.

IRON.	
Pig, Scotch, No 1 (cash), per ton. \$31 00 @ \$33 00	
Pig, American, No. 1 (cash). 32 00 @ 35 00	
Pig, American, No. 2. 30 00 @ 33 00	
Swedish, ordinary sizes. 110 00 @ 120 00	
Ordinary. 75 00 @ 80 00	
Refracted. 75 00 @ 80 00	
Rods. 80 00 @ 110 00	
Horse-shoe. 95 00 @ 100 00	
Hoop. 100 00 @ 140 00	
Scroll. 97 50 @ 130 00	
Flat-rolls, per lb. 6 1/2 @ 6 1/2	
Spring. 7 1/2 @ 7 1/2	
Tire. 7 1/2 @ 8 00	

STEEL.	
Sarn, best cast, warranted, per lb. 18 @ 19 1/2	
Sheet, best cast. 18 @ 19 1/2	
Sheet, second quality. 15 1/2 @ 16 1/2	
Sheet, third quality. 13 1/2 @ 14 1/2	
Saw-plates, circular. 23 @ 24 00	
Double-shear, warranted. 18 @ 19 00	
Single-shear. 18 @ 19 00	
Knottage & Co. (cast bars). 15 1/2 @ 16 1/2	
Machinery, round. 11 @ 12 00	
German, best. 11 @ 12 00	
German, good. 10 @ 11 00	
German, eagle. 9 @ 10 00	
Slister, warranted. 14 @ 15 00	
Slister, common. 10 @ 11 00	
Jossep & Sons', common. 17 @ 18 00	
Double-reinforced. 24 @ 25 00	
Stone-ax shapes. 25 1/2 @ 26 1/2	

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

PACIFIC RAMIE Co.—March 16th. Trustees: M. J. McDonald, J. French and W. P. Lockhart.

MILLS TREADLE MANUFACTURING Co.—March 18th. Capital stock, \$500,000, in 1,000 shares. Trustees: F. E. Mills, J. De Forrest, H. N. Tilden, C. Rowell and W. P. Humphreys.

CALIFORNIA STOCK AND POULTRY ASSOCIATION. March 28th. Capital stock, \$10,000, in 1,000 shares. Trustees: T. H. Selby, S. Hubbard, J. Lindley, W. H. L. Barnes and T. E. Finley.

The following have been recorded in the Secretary of State's office, Sacramento.

MINNESOTA G. & S. M. Co., Owyhee county, Idaho Territory. Capital stock, \$2,000,000, in 20,000 shares. Trustees: W. M. Lent, G. S. Dodge, G. D. Roberts, G. Hearst and J. W. Gashwiler.

SHEBA S. M. Co., Star District, Nevada.—March 21st. Capital stock, \$1,000,000, in 10,000 shares. Trustees: J. C. Fall, R. E. Brewster and G. F

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING MARCH 14TH.

POTATO MASHER.—Charles Adolph Frederick, San Francisco, Cal.

MEDICAL COMPOUND FOR TREATING BRONCHIAL AND LUNG DISEASES.—Shelby Wadon Helm, Bachelor Valley, assignor to Britton Capell and Wm. J. Rose, Little Lake Valley, Cal.

BOOT-JACK.—Joseph Rouard, San Francisco, Cal.

MACHINE FOR BLOCKING RIBBONS, ETC.—George Vincent, Stockton, Cal.

MOLDING MACHINE.—James H. Culver, San Francisco, Cal.

HAIR RESTORATIVE.—William P. Thomas and Joseph F. Boardman, Elko, Nevada.

SAW.—William Kidd, Duncan's Mills, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

PEN-HOLDER.—J. Roth, Virginia City, Nevada. Although the pen, as acknowledged by the general public, is mightier than the sword, notwithstanding its inferior size, yet it has not been subject to as much attention with regard to the facility of carrying it on the person. Mr. Roth proposes, by his invention, to enable every one to have this powerful weapon always ready to the hand. For this purpose, he simply modifies its construction, obviating the necessity of having a more or less cumbersome case. He so constructs the metallic pen-clasp that it can be hinged to the end of the handle or stock of the pen, which, consequently, can be shut down upon the handle. A metallic ferrule is arranged to slide up and down along the handle, and serves to stay the pen and clasp it firmly in place when open for use, as well as to slip over and protect its point when it is closed down on its handle. The device being so handy, it is feared that editorial combats will become very frequent.

WHEEL FOR WHEEL-BARROWS.—G. Withington, Ione City, Cal. Perhaps the Ionians may be able to use this device in carrying through their railroad project. It relates more particularly, however, to wheel-barrow and truck wheels, and the wheels of toy wagons. The spokes consist of metallic bars or rods, bent so that each half will serve as a bracing spoke. The bend of the rod is flattened so as to fit against the inner face of the tire, to which it is secured by a rivet, screw or other fastening device. The end next to the hub or axle is provided with screw-threads upon which a nut is screwed, and the end of the rod or spoke enters a hole in the hub or axle directly under the nut. By screwing this nut up or down on the rod, the spoke can be tightened or loosened as desired, the nut bearing against the hub. In this way a strong and substantial wheel can be made at a slight expense.

APPARATUS FOR SAVING QUICKSILVER.—O. H. Young and J. Vaughn, Wisconsin Hill, Cal. The invention is designed to obviate the usual loss of quicksilver and amalgam in the tailings after amalgamation—an important object. The tailings are led into a box of suitable size, a large part of the floor of which is covered with plates provided with diamond or other recesses or cavities on their upper surfaces. A shower of water is introduced through a perforated plate which extends across the passage way, and is elevated a little above the floor, thus evenly distributing the tailings over the bottom plates. The heavy quicksilver or amalgam is retained in the cavities, while the gangue is washed away. Any quicksilver which may escape the cavities, is caught in a transverse trough at the lower end of the box. A series of small movable gates diverts or guides the stream as desired. A swinging gate, hinged to the middle of the box, diverts the tailings to either side, when it is desired to clean up.

Gresham's Improved Injector for Steam Boilers.

The principal feature of this device, invented by James Gresham, of Manchester, England, consists in providing the central spindle of the injector with two screw-threads, one of which screws through a fixed nut, and the other into a female screw-thread formed in the ram or part of the injector to which the steam nozzle is attached, so that by turning the central spindle a double adjustment is obtained,

whereby the steam nozzle will be made to move in one direction to shut or reduce the water-passage, and the cone spindle at the same time made to move in the opposite direction to open or enlarge the steam passage, or vice versa. This enables a most perfect and expeditious adjustment of the water and steam spaces relatively to each other, to be effected by the turning of a single handle with less than the usual movement of the ram, and the play of the flexible joint, which unites the ram with the pipe through which it receives steam, is diminished.

The accompanying engraving, taken from the *American Artisan*, represents a central longitudinal section of the improved injector. P is the ram carrying the steam nozzle, fitted to work into and out from the body of the injector through a stuffing-box. The cone-spindle, A, which works through a stuffing-box in the outer end of the ram, is represented as having formed upon it two screw-threads, one of which fits a screw-thread in the ram, and the other fits a fixed nut, O, which is attached to the body of the injector by columns, one of which is shown in dotted outline; notches being cut in the flanges of the ram to fit the said columns, which are thereby made to prevent the ram from turning when the screw is rotated. The interior screw-thread of the spindle has one or more notches cut longitudinally through it for the passage of the steam. This screw is of greater pitch than the exterior screw, otherwise the ram would not be operated by turning the spindle.

Autographic Printing Press.

The annexed engraving represents a new printing press, designed to replace the lithographic press, and claimed to be adapted to common as well as fine work. It consists of a wood (or iron) frame, a weight of five pounds acting on a combination of two levers, two connecting rods, a printing cylinder, and a curved stone.

Replacing the old flat stone with the curved one, it is claimed, enables the finest work to be done by unskilled attendants, and obviates the old difficulty arising from the liability of the stones to break. The reasons assigned for this last are, that the ordinary presses give an unyielding pressure. The scraper must pass, or the stone

be broken. With the new press, the pieces are not so rigid, all the parts are movable and the levers, rising and falling, adapt themselves to irregularities in the stone, although the pressure remains constant in all points.

The absence of a tympan results in a saving of seven out of the eight motions required in the old style press, and it is claimed that a boy can easily take off with it one hundred and fifty impressions per hour. All trouble as to the regulation of the pressure on the stone is obviated. There is nothing to do except to move the weight of the first lever to a point which will give the required pressure.

The press weighs only a fifth as much as a corresponding old-style press, can be run by hand or steam power, may be shipped in condition ready for immediate use, is simple and durable, and is claimed to be particularly adapted for office use by companies and professional and business men generally. For further information address the patentee, C. Maurice, 160 William street, New York city.

A New Ellipsograph.

The compass for drawing ellipses, illustrated in the accompanying cut, from *La Propagation Industrielle*, is a German invention. Its operation is based upon the truth, that by cutting a cylinder in an oblique plane, the edges of the cut surface will form an ellipse.

The two arms, properly so called, of the compass remain fixed with their points on a line, (dotted here) the instrument being

held in a vertical plane. A sleeve, h, to which is jointed a third arm, k, is capable both of sliding upon the adjacent arm of the compass and of turning around upon the same. This supplemental arm, k, carries the pencil or tracing point, b. In turning the sleeve, the point, b, describes a circle equal to that of the circumference of a cylinder having for its axis the longer arm of the compass. While this is being done, care is taken to allow the sleeve to slide upon the arm to which it is attached

to an extent sufficient to enable the point to be kept constantly in contact with the paper upon which the ellipse is to be marked.

In order to use the instrument, the fixed points of its two arms are placed upon the (dotted) line, corresponding to the longer axis of the desired ellipse, and the point, b, is placed in the line of the shorter axis and at a distance from the point, d, of the longer arm equal to the length of the shorter radius, the angles of the two arms being adjusted to permit the point, b, to pass from one position to the other, whereupon the ellipse may be drawn in the manner just above described.

State Prisons.

We have received the fifth annual report of the California Prison Association, an organization which is doing most important service in working out one branch of the complicated social problem, and in encouraging by word and deed the improvement, moral and intellectual, of the convict. The report by James Woodworth of a visiting tour to prisons in the East, is interesting and instructive. Regarding reforms at home, he speaks as follows on one important point—a point in regard to which we commit in our State a huge and wide-spread fault:

"We can expect but little in the direction of the prison reform until we can have properly qualified and permanently appointed officers to inaugurate and carry out the measures of reform. And these we cannot possibly have until there is accomplished that Herculean task, so like the cleansing of the Augean stables,—the removal of our prison management entirely from the sphere of party politics. Until the unholy alliance between the two is broken up, no real and permanent progress can be made, but our efforts at reform will be much like the poultices, and gruel, and catnip tea, with which we ply a sick man, and try to relieve his sufferings, when nothing but a surgical operation can cure him of his disease and restore him to health. Of the magnitude of this evil, even in a financial point of view, very few are at all aware. I have before referred to the Albany Penitentiary and the Sing Sing Prison, both in the same State, to show the difference between the operations in this respect of the two; the former realizing a net gain to the public treasury of \$10,000 annually, while the latter costs the State more than \$300,000 a year.

I will say further, in this connection, that in a conversation which I had with an old prison officer, who is a close calculator and knows something by experience of such matters, he told me that if he could be placed in full and permanent charge of the Sing Sing Prison, with the appointment of his subordinates and the letting of the contracts in his own hands, he would be willing to give good and sufficient bonds for the fulfillment of an obligation to make the prison yield a revenue to the State of \$25,000 a year! and as more than that sum is realized from his own prison, with only half the number of convicts that there are at Sing Sing, there is reason to believe that he would be able to do all that he thinks he could. How suggestive is this to us, who are carrying, in our State Prison, a burden that costs us little if any less than \$50,000 every year. And yet this is the least of the evils of our prison system."

The *Alta California* appeared this week in a new and neat dress, which gives the paper an improved appearance. The *Alta* is in certain respects, especially in the arrangement of its matter, excelled by no journal. One always knows where to look in its columns for any desired information.

We received, last week, a pamphlet entitled "Information concerning the Terminus of the Railroad System of the Pacific Coast," issued by the Oakland Transcript. The pamphlet contains much of interest concerning the railroads of this State, but is principally occupied with well written matter showing the advantages and prospects of Oakland.

ANTIOCH AND VISALIA RAILROAD.—The *Contra Costa Gazette* of the 25th inst. says: The expedition under direction of Russell Eddy, which had been out some six weeks surveying a railroad route from Antioch to Visalia, returned last week, having successfully completed the work intended; and it is said that 10 per cent. of a capital stock of \$4,000,000 has been paid in.

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARR before the MECHANIC ARTS CLUB, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Earth and Man.

Owing to some mis-connection the apparatus for the usual chemical lecture was not in readiness on Saturday evening, and Prof. Carr accordingly treated the students and visitors to an original written lecture on Earth and Man—to use Guyot's brief and expressive title for that broad and rich field,—though neither the title nor the matter of the Professor's lecture was from Guyot or any other one author.

Man was in the beginning commanded to subdue the earth. He has learned very many of Nature's great laws, like that of the eclipses. A wise conception of the ancients considered him as a microcosm, and he was indeed the true Jacob's ladder on which the angels ascend and descend—the Lord at the top and the earth at the foot; man intercommunicating with and benefiting from all.

Climate, as furnishing the key to man's development, was then enlarged upon with copious illustrations drawn from the generalizations of physical geography and the history of the civilization of races.

The average annual temperature of the great northern planes of British America and Siberia, the table lands of Asia, the heated plains and plateaus of Africa, with their respective populations, were contrasted with those of Europe and China. The population of one small island, even, had acquired more power and wealth and had done more for the dissemination of civilization, than the scores of nations covering many millions of square miles not favored in this particular essential to the growth of race into power.

The first and chief superiority of America and Europe lay in their uniformity of climate. He cited conquests of southern by northern people, the East Indies, Africa, and even Rome, explaining the fact by observing that the organic functions in favored climates were expended rather in mental and moral growth than in mere physical adaptation to conditions of life. The chests of inhabitants of the warmer latitudes were narrow, those of the more northern broad. Whenever natives of the higher latitudes went south, they were subject, from their accustomed more respiratory food, to an excess of animal heat, and consequently to fevers; while natives of the south going north were subject to rheumatism and consumption from not generating a sufficiency of animal heat. Accordingly the highest physical perfection had developed itself in the temperate zone: oval faces and well marked features, *rs.* flat face, small eyes, ill-defined features in Asiatics, advancing jaws and woolly hair in Africans, etc., and diminutive stature in general in either cold or hot countries, Patagonia not excepted.

A mean annual temperature of 60°, and where the variations are small, seemed to be the conditions that were the most favorable; where the winter is not more than 10° below and the summer not more than 10° above the average.

Brazil and Peru were contrasted as to climate and progress; the former unconquered and wild, because man is overawed by nature; the latter the cradle of an ancient civilization, which, being the earliest and foremost civilization of the new world, somewhat singularly compared with that of Egypt, the first in the old, as both having originated in rainless countries.

Hindustan, a most favored land as to tropical richness and situation, yet conquered by the Mistress of the Seas, was referred to as a case of the natural weakness inherent without the proper tone that is given only by a favorable climate.

The results of the felling of forest had shown, however, conclusively, that man has it in his power, to a great extent, to regulate the circumstances of heat and moisture.

Races, like individuals, could die young or wear out. Of what use was the extension of civilization if dying at the center we find greenness and vigor only at the outer borders? Were we, the Americans of to-day, but the outer circulation of European life, or was there a new center forming here of a permanent race?

If any land was ever destined to grandest ends, he ventured to believe it was this most favored land of ours, where there are no higher nor lower orders save those who do nothing for the improvement of mankind, where there is no despot save ignorance. And was it not enough to stimulate us to the noblest efforts of humanity, to be set in the 19th century, with Europe behind us and Asia before us, while we are ourselves enacting the completion of the circle of civilization that shall girdle the earth? Was it too much to hope that here Nature would find her grandest secrets revealed and her highest types fulfilled?

The lecturer concluded his eloquent peroration with some verses so appropriate to the theme that we regret we are not able to quote them in full, nor even to name the inspired author. The attendance of students and the evident interest in, and utility of, this practical department of the State University continue unabated.

Saturday, April 1st, will conclude the chemical course, and Prof. Swinton follows on Literature and Language.

Steam-Power vs. Electricity.

Prof. Morton, of the Stevens Institute, Hoboken, N. J., gives in a New York paper the following statement of the relative economy of steam and electricity for motive power:—

"The doctrine of conservation of force (now as well established as that of gravitation) teaches us that a certain maximum of force can be developed by the use of a given quantity of any material—as, for example, coal in a steam engine, or zinc in a galvanic battery—which may be more or less completely utilized, but cannot be exceeded. Thus, a pound of coal burned in one minute, if applied without any loss whatever, would develop 332 horse-power for that time; as applied in practice in our ordinary engines, it develops but about 12 horse-power, all the rest being lost. We see here what a margin for improvement exists. We are getting but from three to five per cent. of the 'good' out of our fuel, and we might suppose that some other way of developing force, if less wasteful, might be economical, even if a more costly material than coal were consumed.

"All galvanic engines derive their power from the zinc consumed in the battery. Now, a pound of zinc consumed under the most favorable conditions (*i.e.* without any loss of effect whatever), could yield 35 horse-power for one minute, or say about one horse-power for an hour, if applied to a machine in which there was no loss of effect.

"An absolutely perfect galvanic engine, actuated by a perfect battery, could then, at the best, develop but one horse-power per hour from each pound of zinc consumed in that time (strictly, '917 of a horse-power). Or to develop 2½ horse-power for 10 hours would demand the consumption of about 27 pounds of zinc, and this, he it remembered, without allowance for any loss in the battery, which we know to be very great, or in the galvanic engine, which we may be sure is something. A common steam engine would require for the same work about 125 pounds of coal, or about four times the weight, but then coal is between 50 and 60 times cheaper than zinc. The weak point of the galvanic motor is, then, not only the high cost of zinc, but the low efficiency of that material, being but about one-sixth that of coal, weight for weight."

REPORTED GOLD DISCOVERY.—The utmost secrecy prevails among the knowing ones, regarding the developments from the auriferous regions on the Santa Cruz range. The mines are situated a short distance from the town of Felton, the great lumbering district, but a short distance from the coast. Some ten or twelve years ago, rich placer diggings were discovered in close proximity to these new quartz mines, and for a while paid at the rate of \$7 or \$8 a day. The ore finally gave out, and without further prospecting the party at work left for fresh fields. The old mill yet remains, and the indications in that vicinity are said to be very good for a paying lead. Instead of a pocket, which, when washed out, leaves no further developments, the new mines seem to contain an inexhaustible amount of gold-bearing rock, that is, as far as heard from. The rock that has thus far been taken out, assays at a high figure, and if the hopes of the discoverers are verified, there is a fortune for somebody. We hope to hear in a few days whether the mine is as rich as has been reported.—*San Jose Patriot.*

GOOD HEALTH.

Catarrh.

[Written for the PRESS.]

As much of the general information upon this subject has been furnished by the "patent medicine man," some errors are generally entertained which public welfare dictates should be corrected.

What It Is.

Catarrh, from the two Greek words *kata*, down, and *rein*, to flow, is the name given to a mucous discharge from the nose, head and throat. Any mucous membrane may become diseased, so that it will secrete and discharge an unusual amount of mucous, consequently we have nasal and bronchial catarrh, ophthalmic catarrh, leucorrhœa catarrh of the stomach, intestines, bladder, etc. Catarrh of every form may be either acute or chronic, according to the length of time, since its invasion, and the changes which have taken place in the mucous surfaces. There are also some forms of specific catarrh, communicated by contact, but they need not necessarily be described at this time. It will, however, be understood that any unusual flow of mucous, from any mucous surface as a result of disease, is catarrhal in its character.

Symptoms of Catarrh.

The discharge generally first makes its appearance upon "taking cold in the head." There is always a feeling of heat and swelling of the face, the head aches, the eyes are red and watery, there is a sense of tightness or constriction across the forehead and root of the nose, with a feverish sensation, with thirst, alternate heat and chilliness, and an extreme sensitiveness to cold. The nose becomes "stopped" and discharges an acrid mucous. This may continue several days, but if the general health is good and no more cold is taken the acute catarrh "gets well itself." On the other hand, if there is a catarrhal diathesis, a constitutional predisposition to it, the cold does not get well itself, but more is taken and repeated till an acute catarrh becomes chronic when the whole lining mucous membrane of the nose and sinuses of the head and face become deeply diseased and "perfectly rotten." At this stage it is either difficult or impossible to breathe through the nose, the discharge is thick, and sometimes very offensive, and runs down into the throat.

Ozena from the Greek *ozein*, to smell, or *oze*, a stench, is a form of catarrhal disease of the nose characterized by a deep redness, a thin acrid discharge, sometimes scabs inside the nose, a tendency to ulceration, not only of the soft tissues, but also of the cartilages and bones of the nose, and in its well developed stages, by a very offensive odor. Its constitutional dyscrasia seems to be more deeply laid than that of ordinary nasal catarrh, so much so that it does not necessarily depend upon a "cold in the head" to arouse it into activity. Ozena inclines to penetrate—eat into the tissue—while ordinary catarrh spreads more easily over a larger surface. Ozena may destroy the nose, while catarrh extends to the head, throat and bronchial tubes when it is called bronchial catarrh or bronchitis.

In the advanced stages of either catarrh, leucorrhœa or ozena, the blood is generally pale and dark colored, the countenance is pale, the appetite is capricious, the stomach is deranged, the bowels are irregular, and there is a feeling of weakness and languor, a sensitiveness to cold, with cold feet, and heat of the head. The poor patient "feels sick all over." In view of these facts, it must be admitted that chronic catarrhal affections are not local in their character, but on the contrary, the whole system is deranged and every organ and tissue is in a diseased condition. If the blood was rich and healthy and the patient was strong and vigorous, the catarrh would soon get well itself. On the other hand as long as those irritating causes exist, they are capable of not only sustaining but producing local catarrhs.

Mal-practice.

In view of the above facts how utterly foolish it is to rely upon snuffs, washes, or any other patent local application to cure a disease of such a general character. Local applications may be found to smother over any old ulcer, yet it will break out again as bad as ever and so it is with catarrh,—temporary relief is only afforded—the disease is only suppressed to break out again with greater energy. This is so uniformly true, that it may be safely

asserted that no case of catarrh was ever cured by the use of local applications only. If this subject was properly understood, people would not ruin their prospects for a cure and squander their money for preparations which are gotten up for the express purpose of enriching their manufacturers, but are utterly useless for the purposes employed. Instances are so abundant in the experience of every intelligent physician, of persons seeking his aid after having gone the rounds of quack nostrums and patent medicines without benefit, that no one having a sense of justice and a desire for the welfare of the community in which he lives, can refrain from condemning such wholesale deception in the strongest terms.

How to Prevent and Cure Catarrh.

In order to do this the first and most essential rule to be observed is to avoid taking cold. To do this, the feet should be kept clean, dry and warm. Bathing every day is not good, but dry friction over the whole surface of the body till a healthy glow is produced, once a day, with a flesh brush or hair mitten should be practiced.

The clothing should be sufficient to keep the body comfortable but not too warm, and should be changed throughout as often as twice a week. It is generally best to wear flannel next the skin.

The sleeping apartments should be kept well ventilated and dry. To do this a good fire in the room once or twice a week is proper, and essentially necessary in all damp localities. This is true of every portion of the city of San Francisco, and every other place near a large body of water, when the atmosphere is loaded with vapor. The food should be light, nutritious and easily digested, and the drink should be pure cold water.

Medical Treatment.

This I would gladly give if I could, yet, the influence of age, constitution, form and stage of disease and its complications are so numerous, that any attempt of that kind would only prove a positive failure, as far as benefit from self-treatment by the people themselves is concerned.

It is therefore advisable in this, as in all other forms of disease, for the people not to *dose themselves*, but to use every sanitary measure possible to keep well; but if medicine is necessary, to procure it from those who have made the application of medicine to the cure of disease a special study and practice and are thereby able to give permanent relief without producing medicinal complications which are more aggravating and difficult to cure than the original disease itself. E. J. FRASER, M. D.

San Francisco, March 26, 1871.

NEW REMEDIES FOR BURNS.—Two new remedies for burns are added to the long list. The first is charcoal. A piece of vegetable charcoal laid on a burn at once soothes the pain, says the *Gazette Medicale*, and if kept applied for an hour cures it completely. The second one is sulphate of iron. This was tried by M. Joel in the Children's Hospital, Louisiana. In this case a child, four years of age, had been extensively burnt, suppuration was abundant and so offensive that they ordered the child a tepid bath, containing a couple of pinches of sulphate of iron. This gave immediate relief to the pain, and being repeated twice a day—twenty minutes each bath—the suppuration lost its odor, and the child was convalescent.—*Medical Press and Circular.*

THE SKIN A BREATHING ORGAN.—Some animals breathe more through the skin than they do through the lungs; and in some animals the whole process of aeration of the blood is performed through the skin. In the human being the skin is, to a large extent, a breathing organ. Fatal disease of the lungs is often caused by an obstructed skin. In one of the ceremonial processions at Rome, attendant on the installation of a new Pope, a child, having the whole surface of the body gilt, was paraded. The consequence was the death of the child. This melancholy fact may serve better than a long lecture, to convince people of the importance of "keeping the pores open" of which there are more than three thousand on every square inch of surface.

AN IMPORTANT CAUTION.—Books which have been handled during recovery from scarlet fever should be burned after they have served their purpose for the patient. A writer in the *Athenæum* says that in the stages of recovery such books frequently become charged with germs of the disease.

THE Chinese relieve neuralgia and gout by applying oil of peppermint over the affected part with a camel's hair pencil.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.—We have received the catalogue of the Eighth Industrial Exhibition, the substance of the greater part of which we have already published. The catalogue contains the rules and regulations with regard to articles for exhibition, the classification of exhibits, and the various premiums. The following grade of premiums will be awarded:—1st premium, gold medal; 2d premium, silver medal; 3d premium, society's diploma; 4th premium, honorable mention. The medals will be accompanied by certificates of award. Further and special premiums may be awarded. The special cash premiums we have already given in full. The catalogues and particular information may be obtained of Mr. J. H. Gilmore, Special Agent, Eighth Industrial Exhibition, San Francisco.

THE PACIFIC RAILROADS.—We are indebted to the kindness of Senator Stewart for a copy of his Report in relation to freights on the Pacific railroads. The gist of the report is that the interests of the government are clearly connected with having the Pacific railroads remain as at present, and are best served by patronizing the roads to the full extent of the public business. Mr. Stewart has also sent us the Report of the Judiciary Committee with regard to whether the railway companies are bound to reimburse the government for interest on the bonds received from the U. S. before the maturity of the principal thereof. A negative answer is given.

THE AMERICAN WHALING FLEET now numbers but 285 vessels, with an average measurement of 85,000 tons, against 670 vessels, aggregating 220,000 tons in 1857. Of the number now afloat, New Bedford owns 174; and one-half of those to arrive this year, will be withdrawn from the business.

TWELVE thousand pounds of buffalo meat and 100 antelopes were lately received in Boston.

Norway and the Pacific Coast.

An article in our excellent German contemporary, the *Berg und Huettenmaennische Zeitung*, concerning mining in Norway, contains so much which might be said concerning our coast, that we cannot refrain from giving a free translation of it. Our readers of the interior can substitute for the word *Norway*, the name of their respective districts in many instances with good effect, although, probably nothing was further from the intention of the writer than to think of such a substitution. The article is likewise interesting for the information it gives concerning Norwegian mining.

Although Norway is remarkably rich in metals, yet mining and smelting are far from obtaining the extensive application which is warranted by the mineral wealth of the land. The cause for this condition, which is so injurious to the industry of the country, is to be sought principally in the following reasons:

1. The transportation of ore is rendered difficult by the want of proper means of communication, and is hence too expensive to permit working.

2. Norway has not the necessary institutions for educating miners, and almost all her best engineers must get their education first in foreign countries.

3. There is a lack of capital for carrying on extensive operations, and the greater part of the mining property now worked is consequently held by outsiders. Nevertheless, there is commencing to be an improvement in the condition of the land, and as the founding of a mining academy is proposed, it is probable that more attention will be given this source of wealth.

There is, however, a special difficulty to be surmounted in order to gain the confidence of capitalists, which has been much weakened by the following circumstance. There is in Norway a very large number of deposits which lie near the surface, but have no depth. Ignorance of mining and a spirit of speculation, in connection with these, have given many a heavy fall to capitalists, and have prevented the working of the many really valuable deposits. So soon as Norway, however, has a proper mining academy and skilled miners possessed of the necessary knowledge of all the conditions of the land, mining will assume its proper position, especially if a necessary change in the laws is made, to relieve mining operations of certain burdens now imposed.

In regard to the different metals which Norway produces, iron takes the lead, although it is inferior to the Swedish article, and the importations exceed the exports. The production of silver, which is limited to the works at Kongsherg, and to one other (small) mine, is not unimportant, although generally over-estimated in the country. The amount of gold produced is exceedingly small, but lately richer indications have been found in the northern mountains. After iron come copper, nickel and cobalt, and since 1861, pyrites have formed one of the most valuable products of the Norway mines. Copper and nickel have increased particularly in importance in the last five years.

LIVERPOOL COPPER MARKET.—There was, during February, as we learn from the March report of James Lewis & Son, a good consumptive demand for copper produce at gradually advancing rates. There was a noticeable disparity between the improvement in bars and that in furnace material, the former having advanced \$5 per ton and the latter 12 cents per unit, equal to \$12.50 per ton of fine copper. This arose from the large amount of bars on hand and the deficiency of ore and regulus. The local smelters had secured all the ore and regulus obtainable at and under \$3.37 per unit. Quotations for ore at Liverpool were \$3.37 to \$3.43 per unit. Quicksilver was reduced to \$56.87 per flask.

Assaying.

A few days ago, a gentleman showed us a number of certificates, from different offices, of assays made of some rich galena ore. The ore he claimed to have carefully sampled previously, and the difference in the returns he thought was very much greater than could result merely from any difference in the samples.

Not seeing the ore and knowing nothing of the circumstances, we could of course give no opinion on the matter. But the incident furnishes us with a text concerning one point in assaying on which enough stress is not put in practice. We have visited a large number of assay offices in our wanderings from New York to San Francisco, and we have found ample illustrations of the proverb that "a want of care does more damage than a want of knowledge."

Care and method are two most important requisites for a good assayer, and a want of them, we are inclined to believe, vitiates more assays than almost anything else. We have often heard an assayer, when making a number of assays, guess that this sample or that bead was that of a certain ore. He had neglected to mark it, and could not know with absolute certainty whether it was from this or that lode. Now, when we hear an assayer guess at such a thing, we form an opinion immediately as to the value of his returns.

There is probably no better assayer in the world than Prof. Fritzsche, of Freiberg. It is really beautiful to witness his skill and accuracy. At the same time, there is perhaps no more methodical person in the universe. He insists on every thing being done exactly in one way, the samples must be placed in exactly such an order every time in the furnace, the tongs must be held in exactly a certain manner, etc., etc. The greatest stress is placed by him on such apparently little matters; but the more we see of assaying, the more value we are inclined to put on just these little matters. Order and method in everything are essential. It is much cheaper and simpler and precisely as good to guess at the amount of precious metal in ore, as to guess which bead belongs to a sample.

An assayer who is accustomed to follow a fixed rule in such matters, is much less liable to mistakes than one who has no order in his office. This is perhaps a platitude in theory, but it is something more in practice.

A successful teacher of assaying used to tell his scholars at the commencement of the course that there were three fundamental principles of this branch of mining,—exactness, cleanliness and fairness.

When we find great differences in the results of assays of the same ore, if we do not find an explanation in the character of the ore, we are inclined to seek it in a want of one of these principles. Of course there are many persons who are unable to make a correct assay, but there are also many who have sufficient knowledge and honesty, but fail in the points mentioned and therefore fail wholly as assayers.

While on this subject we may speak of a kindred matter. We have been asked concerning the assay of gold quartz by taking the specific gravity. No assay of this kind is worth much. But in purchasing rich quartz specimens it is at times desirable to ascertain their intrinsic value without destroying the specimen. When there is no foreign matter present, this can be done approximately by determining the density of the mass. We therefore adopt a suggestion made to us, and publish the following table from J. Arthur Phillip's work.

The table exhibits the proportion, by weight, of gold in auriferous quartz of a given specific gravity. In calculating it, the specific gravity of gold is taken as 19, that of quartz as 2.6. The table is read thus, for instance: Auriferous quartz, whose specific gravity is 5.2, contains

0.5793 of its weight of gold; or, which is the same thing, 10,000 ounces of the quartz contain 5,793 ounces of gold.

TABLE

Showing the proportionate weight of Gold in a mass of auriferous quartz, when the specific gravity of the mass is known.

Specific Gravity	Proportion of Gold	Specific Gravity	Proportion of Gold
2.6	0.0000	5.2	0.5793
2.85	0.0219	5.4	0.6007
2.7	0.0429	5.8	0.6206

4.9	0.5438	17.0	0.9813
5.0	0.5561	18.0	0.9912
5.1	0.5679	19.0	1.0000

OXYGEN AND HYDROGEN are manufactured by the New York Oxyhydrogen Gas Company in large quantities. It is stated in the *Arbeitsgeber* that about 80,000 cubic feet of oxygen are produced daily, according to Tessié du Motay's process. Oxygen is sold for 5 cents per cubic foot and hydrogen for 2 cents. The oxygen is employed in this vicinity not only (as in Europe) for chemical experiments, but also for medicinal purposes and especially for producing a brilliant light for building purposes, etc., as in the case of the New York bridge. The demand for hydrogen gas is considerably less than that for oxygen, as common illuminating gas is used largely for feeding the oxyhydrogen gas, lamps. The brilliancy of an hydro-oxygen flame, which is fed with illuminating gas is about 16½ times as great as that of a common gas flame with the same consumption of the illuminating gas. The use of this hydro-oxygen gas with the magic lantern, for illustrating lectures, etc., is very considerable.

A NEW HOME MANUFACTURE.—While not excluding ourselves in a provincial manner from the rest of the world, it is wise to help ourselves as much as possible by fostering home industries. The beginning of a new home manufacture should be encouraged, as it will redound to our own personal benefit hereafter. We have room here on our coast for many a factory, and extensive manufacturing establishments are needed to develop our resources. And they can be made to succeed. When Mr. Selby proposed erecting shot works, a failure was predicted. These works now not only furnish our home supply, but even export in considerable amounts. This is one example of many. They are now engaging in another manufacture, that of a composition water pipe, which is claimed to be lighter than the ordinary lead pipe, cheaper than iron, and very strong and serviceable; and to this fact we wish to call attention. Selby & Co., 116 California street, have samples for examination.

COMMENDABLE LIBERALITY.—The Humboldt Register says that the Central Pacific Railroad Co. has made a very liberal offer, and one which will enable every property owner in Winnemucca to procure shade trees free of cost. D. H. Haskell, town-site agent for the company, is authorized to supply the citizens with 250 trees of the mulberry variety, and deliver them at the depot in that place free of cost, to all who will promise to set them out and care for them. Would it not be to the interest of the company to make a similar offer to every town and stopping place along the entire route of the road?

GROWTH OF THE PEPPER TREE.—In Los Angeles there is a pepper tree grown from a seed planted three years ago, the trunk of which measures over eighteen inches in diameter.

The Eagle Hay Press.

We give herewith a representation of what is claimed to be the most efficient hay press ever introduced to the notice of the public. It is known as the "Eagle Hay Press," the invention of J. A. McGillivray, of Illinois, by whom it was patented in 1865. Its large sale in the Eastern States has induced the proprietors to introduce it into California and the Pacific States.

The power is applied by means of two levers, arranged in such a manner that

its application increases in ratio to the resistance, as the levers approach a horizontal position. It is not only a powerful press, but it is simple and not liable to easily get out of order; hence it can be afforded cheap. It is said that three men, with one horse can bale from 10 to 15 tons of hay per day, each bale weighing from 250 to 300 pounds. It is also well adapted for pressing hides, rags, wool or cotton. When a bale is pressed and fastened, the follower runs down of its own weight, and the bale can be taken out on either side.

These presses are now manufactured by the Kimball Car and Carriage Manufacturing Co., of this city—the most extensive establishment of the kind, on the Pacific coast, who are the proprietors of the patent for this cost, and who warrant that every press made by them shall give perfect satisfaction, and at prices within the reach of all. The well-known reputation of the company is of itself a good guarantee that whatever they take hold of is valuable and well worthy of general attention.

Gopher Trap.

We have previously spoken of a simple and effective trap, invented by Mr. D. N. Phelps, of San Leandro, and patented through the SCIENTIFIC PRESS Patent Agency. We now give a small cut show-

ing the construction in which one or two improvements have been made. The trap consists of a stout wire, bent so as to form a spring trap as shown in the drawing. It is sprung by pressure against a broad sheet-iron trigger. The dotted lines show the trap when sprung. It has been tried in a large number of cases with great success.

The trap is made of different sizes, and by a slight change in the adjustment of the trigger, can be used for catching rats. It is, indeed, used for various "small deer," squirrels, rabbits, skunks, badgers, coons, foxes, coyotes, etc., etc. Its effectiveness recommends it highly to our farmers. It is manufactured by Mr. Phelps, who may be addressed as above.

A WHITE-WINGED TEAL DUCK was lately killed in Yolo county, and is now on exhibition, stuffed, at Corbin's saloon, Sacramento.

Power Press, Punches and Shears.

Among the machines which attracted considerable attention at the late Industrial Exposition at Cincinnati, those shown in the accompanying illustrations were particularly prominent, on account of the great power and exceeding ease which they exhibited in working.

The manufacturers, Messrs. Long, Black

They have also perfected a double machine of medium size, either end of which can be worked independently of the other, or both can be used at the same time if required. It is a very desirable machine for wagon, drill, or plow makers, or for any other light work. It is capable of punching a $\frac{3}{4}$ inch hole through $\frac{3}{4}$ or $\frac{1}{2}$ inch iron, or will cut off $1\frac{1}{4}$ inch round, or shear off $\frac{3}{4} \times 4$ inch iron. It is also very

LONG, BLACK & ALLSTATTER'S POWER PRESS, PUNCHES AND SHEARS.

& Allstatter, of Hamilton, Ohio, have, from the requirements of their business, been compelled to study the adaptability of power presses to the necessities of workers in iron. After fourteen years of experience, they have produced a machine which they claim to be unexcelled for power, durability and convenience. These presses and punches, in their various modifications, are adapted to the wants of railway, railway car, and iron bridge builders; for safe and boiler manufacturers, rolling mills, and makers of agricultural implements, and plow and wagon manufacturers, as well as the lighter kinds of work, such as cutting nuts and washers, or cutting and forming cutlery.

speedy in motion, being run to 40 or 50 motions of the slide per minute.

Messrs. Long, Black & Allstatter make seven sizes of presses; that for boiler makers and safe makers, has jaws 18 to 20 inches in depth to permit working in places inaccessible to the machine of ordinary shape.

FOSSIL METEORITE.—The *Academy* says:—"A new meteorite has just been discovered in the miocene deposits of Greenland, and brought to England. It has been offered, we understand, to the Trustees of the British Museum for £240. This is the first instance on record of a truly fossil meteorite."

CONSOLIDATION.—According to the *Colorado Register*, there is a probability of the consolidation of several companies owning adjacent claims on the Gregory lode at Central City. We are rejoiced to hear of such a step. It is especially needed in that region, and elsewhere. The paper mentioned comments to some extent on the subject, and speaks as follows concerning the California lode which is being worked for a distance of over half a mile and has produced over \$2,000,000. The remarks are capable of a wide application. "And what amount of this handsome yield is profit? We venture to assert not over 15 per cent. on the sum total, when it should be 20 per cent. per annum. We know that 300 feet of the Stalker & Standley claims alone gave a net profit above all expenses during the last two years of say \$150,000. But our question is, why is not this entire vein made to pay a profit of 20 per cent. per annum of its product, and its yield increased 1,000 ounces per month, or, say, \$20,000 of our currency? It is because Tom, Dick and Harry each own 100 feet more or less on the vein, and each must erect machinery, sink shafts, run levels, etc., in his own peculiar way and independent of the benefit his neighbor on either side could give him or he his neighbor, and thus each man has the same expense to break and raise the ore from his individual property, as one man would have in breaking and raising from the half dozen properties, and adding to what ought to be the actual cost three, four, or even six times. But let Tom, Dick and Harry consolidate interests and properties, elect one of their number manager, the rest go to work under his direction, and instead of running three or four different engines on that number of claims, run one and work the three or four properties; then the result from one main shaft would be that we could count with some certainty upon one-fifth to one-fourth of the product being a net dividend to the owners. But until there is such a consolidation either by sale or otherwise, there can be little hope of realizing a larger net profit than now. With such consolidation, success would be certain."

A COMMENCEMENT.—We have, from time to time, spoken of the destruction of fish in our streams, and the necessity of steps being taken to preserve a supply of the funny tribe. We see, however, that the work of getting rid of them has been going bravely on, and now the effect is being felt in at least one instance. According to the *Reno Crescent* the Truckee river is being cleaned out of the delicious trout for which that stream is famous. Owing to the obstructions in the river, few, if any, fish succeed in making their annual trip to the head of navigation. Though this is the regular spawning time, no fish are to be seen in the upper portion of the river, while below the dam of the Pyramid Lake reservation they are being caught by the wagon load.

TRUCKEE BURNED DOWN.—This unfortunate town, which has been the center of a very extensive business, has been again visited by a conflagration. On the afternoon of the 29th, the Kennebec Hotel caught fire and the flames swept through the town, destroying totally one hundred and fifteen to twenty houses. The Central Pacific freight house was burned to ground. Loss is very heavy, Cal. a most severe blow to the place.

A NOTEWORTHY OFFER.—Mr. O. W. Easton, a gentleman of very considerable experience in the mines of this coast, proposes to erect chlorination works at mines on a suitable scale, and in order to bring the matter within the means of the many, offers to erect and run them until he has received his compensation from the sulphurets worked. This is an offer which is well worth noticing, as it assures that the works will be a success. The idea is rather novel to our coast, and we call the attention of miners to the advertisement in another column.

THE SUTRO TUNNEL is now in 1,867 feet, with work constantly and rapidly progressing.

DOMESTIC ECONOMY.

THE USE OF PUTRID FOOD

Most civilized people prefer meat that is fresh and sweet, to that which has become more or less tender by partial decomposition; still there is a large portion of the enlightened world that prefer the latter.

Some barbarous nations prefer it after it has become quite putrid; as the Tartar and Siberian tribes and many others. The native New Zealanders, who eat large quantities of soaked and boiled corn, will not eat of it until after active putrefaction has set in from soaking. A decayed egg is said to be preferred by the Siamese to one just laid; and it is all the more esteemed if accompanied with an incipient chick.

In England, especially among the *gourmands*, fresh meat of any kind is not considered fit to eat until it has become repugnant to the refined olfactory organ. Venison especially is never put upon the table by them until the signs of its having been long killed are unequivocal.

This peculiarity of taste is nothing new in the world, for we are told that the highly polished Greeks and Romans were more given to such taste than any modern civilized people. They even sought out modes of slaughter which would hasten decomposition. The former strangled their swine and other animals so as to eat them with their coagulated blood, and early incipient decomposition. The latter people sometimes killed their animals by transfixing them with a red-hot spit or spear—an instrument which would cause death quickly and prevent the flow of blood. The Jews were a most remarkable exception to these practices—they were especially enjoined to “abstain from things strangled.”

It is worthy of note in this connection that wherever a people have professed to be directed in their course of life by the Most High, they have always been led into excellent ways, and into dietetic habits which, even in the light of the present high state of science, are pronounced the very best which wisdom can devise.

A false impression has been quite prevalent among many that meat long kept is more easily digested and therefore more healthy. But the truth is, that when food of any kind is taken into the stomach in a state of incipient putrefaction, that process is rapidly accelerated by the warmth and fluids of that organ, and at the expense of healthy digestion. This is true, no matter how slight a commencement has been made; even the incipient putrefaction so generally employed in “raising” bread seriously affects most stomachs, though the fact is not generally acknowledged.

Putrefactive matter is *poison*, and entirely inconsistent with healthy digestion. The human system accommodates itself to such poison, only by slow degrees, just as it does to the use of arsenic or any other poison; but evil effects are just as sure to be the result. Can any one, however small, can be taken into the stomach—as it must be when it enters the stomach—with impunity?

HOW TO SAVE YOUR SHOE SOLES.—Melt together tallow and common resin, in the proportion of two parts of the former to one of the latter, and apply the preparation hot to the soles of the boots or shoes—as much of it as the leather will absorb. One farmer declares that this little recipe alone has been worth more to him than the cost of five years subscription to the newspaper publishing it.

TO MAKE BOILED ONIONS LOOK WHITE.—Take a white or yellow-skinned kind. Skin them thoroughly. Put them to boil. When they have boiled a few minutes, pour off the water, and add clean, cold water, and set them to boil again. Pour this away, and add more cold water, when they may boil till done. They will be white and clear.

LEY HOMINY.—To a gallon of shelled corn, add a quart of strong ley. Boil together until the husks begin to come off the corn; rub the grains of corn between the hands, to entirely remove the husk; wash it well, and boil in plenty of water until the grains are soft. It requires long boiling. As water may be needed, replenish with hot water. Boil in it sufficient salt to season. When nearly done, stir it from the bottom to prevent its burning. Before using it, mash it slightly with a wooden mallet, and fry in a small quantity of lard or butter. It will keep several days in cold weather. Put it in a covered earthen bowl or jar.

Very fine hominy is made by moistening cracked corn with a little warm water to facilitate the removal of the husk, and fanning during the process. When the grains are sufficiently free of husk, wash well and boil until soft. When wanted for the table, mash and fry in lard or butter until the side next the pan has formed a good crust; lay a plate upon it and invert the frying-pan, or it may be seasoned with butter and only kept on the fire until hot. The large hominies are used principally in cold weather, grits or small hominy all the year round, being fresh-boiled every day.

TANNING SHEEP SKINS WITH THE WOLF ON.—Nice white sheep skins make handsome door mats, cushions, a warm spread to put on the floor for baby to sit on in winter time, and serve many other useful purposes. They would no doubt be much oftener found in the farmer's home, especially if he knew how to properly prepare them; hence we offer the following description of the manner in which they may be prepared:—Tack the skin upon a board with the flesh side out, and then scrape with a blunt knife; next rub it over hard with pulverized chalk until it will absorb no more. Then take the skin from the board and cover it with pulverized alum. Double half way over with flesh side in contact, then roll tight together and keep dry for three days, after which unfold it and stretch it again on a board or door, and dry in the air and it will be ready for use.

NUMBER OF OCCUPANTS TO A HOUSE.—The average number of persons to each dwelling in London is eight; in Paris, thirty-five; in Berlin, thirty-two; in Vienna, fifty-five; and in St. Petersburg, fifty-two. Thus it seems that the English are the most isolated dwellers of the European nations. It is usual with French and German families, upon the marriage of their sons, to assign them a portion of the family dwelling, so that three generations often occupy one hotel. In England every head of a family seeks a separate establishment, from the cottager to the lord. Such is also the custom in our own country.

MOTHS.—The following simple precaution against moths is represented to be quite as sure as any of the popular antidotes: Safety from moths for furs consists in baying them undisturbed through summer in a snug place. Muff boxes are not secure. Taking them out to the air occasionally exposes them to the moth. No pepper, camphor or tobacco is needed. After you have worn them for the last time in the spring put them into a linen pillow case, tie up the end in a tight knot, and shut them up in a drawer which will not be often opened.

TO PROTECT THE SLEEVES OF A DRESS.—It is often necessary to make biscuit for tea, or to wash supper-dishes in a very nice dress. Some protect their sleeves at such times, as follows: Take a pair of worn-out stockings. Cut them off at the ankle. Hem them, if you wish. When you want to use them, draw them on to the arms, top end first. They are so elastic that, if care is used in drawing them on, they will not crush the sleeves.

TO FRY SWEETBREADS.—Let them soak a few minutes in water. Take them out, and wipe them perfectly dry. Do not cut them or split them. Put on pepper and salt. Let the pan get hot, with a very little butter or perfectly sweet lard in it. Now lay in the sweetbread. Don't be in a hurry to turn them. If in danger of burning, remove from the front of stove. When cooked nearly through, turn them, and let them cook as long again. They must be well cooked.

CRACKER CUSTARD.—Make a rich lemonade with two lemons and one pint of water; sugar to taste. Add four grated Boston crackers, one tablespoonful of butter, and a little mace. Bake in paste.

Domestic Receipts.

“L. S. B.” Sacramento.—We can give only the receipts which you send. **To Make Corn Bread.**—Take one quart of meal, after sifting, put in two tablespoonfuls of brown sugar, half a teaspoonful of salt—too much salt in corn bread makes it hard—pour on boiling water until the meal is of the consistency of thick mush; when it is cool enough to work without burning your hand, put in half a cup of yeast, then a coffee cupful of flour, mix well and put in a well-buttered pan for baking; allow it to stand in a warm place for one hour, to rise; it must not rise as much as wheat bread, else it will fall in baking. Put it in the steamer, and steam for three hours; then in the oven, and bake one hour. You will find this bread light and healthy. Corn bread should be made when other cooking is going on, to save fire and extra labor.

To Make Wheat Bread.—The same correspondent sends the following: It is better to make four small loaves than one large one, because a cut loaf dries faster than one uncut. Take a teaspoonful of salt, mix in flour enough to knead well, and stand away to rise. When light, pour the dough out on the mixing board and knead well. Now cut the dough into four equal parts; butter the baking tins, mold your loaves, and place them in the tins. When light, place in oven and bake. If the crust is too hard, wet it a little when cold.

COTTAGE CHEESE.—Pour boiling water into a pan of “loppard” milk; it will curd at once; stir it and turn into a colander, pour a little cold water over it, salt it and break it up. A better way is to put equal parts of butter-milk and thick milk in a kettle over the fire, heat it almost boiling hot; pour into a linen bag and let it drain till next day, then take it out, salt it, put in a little cream or butter, as it may be, thick or not, and make it up into balls the size of an orange.

SWEET BISCUIT.—Make a dough of butter-milk and the best Graham flour, adding a teaspoon of sugar to two quarts of wetting, and just as little soda as will overcome the acidity of the buttermilk. Mold the dough as soft as it can be handled, roll it out to the thickness of three-fourths of an inch, cut round with a cookie-cutter, and bake in a quick oven. A teaspoon of chopped raisins is an agreeable addition.

SCORCHED GOODS.—Boil them in milk and turpentine, with half a pound of soap, half a gallon of milk. Lay in the sun.

Mechanical Hints.

PRECAUTIONS IN MAKING VARNISH.—As heat is often used in dissolving gums for making varnish, there is always more or less danger of the mixtures taking fire from boiling over, upsetting or by some other accident. To avoid danger it is well to always have a piece of board close at hand to cover the top of the vessel, in case the spirits or other mixture takes fire within the vessel, as it sometimes does. A further precaution, and the only effectual one to use if the liquid boils over, is to have a piece of wet blanket always at hand, sufficiently large to cover both the vessel and the stove or fire. This should be instantly thrown over in case of fire, to smother it. Water will be of little use; loose earth or sand is much better. These precautions should always be taken.

TO BRONZE ON WOOD.—Having stained those parts intending for bronzing black, by any of the usual methods, take japanners' gold size and mix with a small portion of Roman ochre and Prussian blue; go over the blacked parts lightly; then suffer it to dry till it feels sticky to the fingers, but not to come off; then with a hard ball of cotton dipped in any of the bronze powder, rub those places that are prominent, and, if you think proper, give it a thin coat of japanners' gold size, thinned with spirits of turpentine; or you may alter the color of your bronze by mixing either more or less blue, as also other colors, as verditer green by itself; but do not put your color on thick over the black stain, but rather glaze it on, for it is not wanted in a body, but should be rather transparent, as it gives it more of a metallic appearance.

TO IMITATE BLACK WALNUT.—There are two ways of doing it. One is by staining pine or other light colored wood with Vandyke brown or burnt umber mixed with oil, and afterward varnishing. The other is by painting first a light ochre color, in oil, staining when dry with water-color made up of Vandyke brown, umber, or any other suitable pigment. When this is again dry, varnish with damar, copal, amber, or some other resinous turpentine varnish.

Life Thoughts.

SELF-RELIANCE.—For that thou canst do thyself, rely not on another.

The happiest man is the benevolent one for he owns stock in the happiness of all mankind.

No man is master of himself so long as he is a slave to anything else.

A Wise man makes more opportunities than he finds.

SHAKESPEARE defines charity: “Gently hear, kindly judge.”

Don't give up trying to do right. Whatsoever your trials may be, look above for strength to do your duty, and leave the result with God.

If the highest life is that which is inspired by faith in God, the most efficient is that which is energized by a spirit of faithful labor.

The aim of an honest man's life is not the happiness which serves only himself, but the virtue which is useful to others.

Sorrow comes soon enough without despondency; it does a man no good to carry around a lightning-rod to attract trouble.

The man who feels remorse for the evil he has done is to be pitied; but there is one being still more unfortunate, he who feels his guilt beforehand, and still commits it.

MANKIND has been learning for six thousand years, and yet how few have learned that their fellow-beings are as true as themselves.

The more a man knows, the less he is apt to talk; discretion allays his heat, and makes him coolly deliberate what and where to speak.

The worthiest people are most injured by slanders; as we usually find that to be the best fruit which the birds have been picking at.

Poverty and pride are inconvenient companions; but when idleness unites with them, the depth of wretchedness is attained.

What stubbing, ploughing, digging and harrowing are to land, thinking, reflecting and examining are to the mind.

How to be a Man.

A few words of advice to such young men as wish to be anything or to achieve anything in this great, busy, bustling world, is given in the *Spectator* of this city as follows:—

1st. Would you be a man! When Diogenes went through the city of Athens, with a lighted candle, in open daylight, being asked what he was looking for, he answered, “A man.” Would you be a man, in the sense of Diogenes, in this famous laconic reply. If so, consider what it is to be “a man.” Study the truest models of manhood. Make your ideal, and keeping it steadily in the mind, make a persistent, unrelenting effort to grow up to this standard.

Inquire, diligently, what are the elements upon which men of this pattern have subsisted and grown up to their noble proportions. Your having before your minds a grand ideal will stimulate and sustain your energies and by a mysterious law of your mental nature will operate a gradual conformity and approximation to this lofty standard, which habitually attracts your mental gaze.

If the best models, being well studied, improve the taste in fine arts, and inspire genius with the power of high execution; if the reading of the best books, with attention, elevate the taste and the style of composition; it is also, that a careful study of the highest style of manhood, will gradually lift up the student to the same lofty standard in all of its essential elements. To say the least you will be much more of a man, for having aspired to the noblest type of true manhood. In another paper, we will record some reasons for setting before your mind an object, to be aimed at, a noble, worthy object in order to high achievement, and in order to avoid the odium of having life a failure.

ANGRY WORDS win nothing but contempt. Have you ever chanced to catch a glance at yourself in a mirror when in a violent rage? Did you not make a ridiculous picture? The distortion which anger occasions to the countenance renders it a striking exponent of mental character. The lines become fixed in time, and alas! so does the habit, until we hear people complain that they cannot restrain their temper. They can if they like.

There are eyes which need only to look up to touch every chord of a breast choked by the stifling atmosphere of stiff and stagnant society, and to call forth tones which might become the accompanying music of a life. —Jean Paul.

Silk Culture in Utah.

The people in this Territory are becoming fully alive to the importance of the general introduction of silk culture as one of the best and most profitable industries of the country. Brigham Young is already quite an extensive producer of silk. Other parties are also engaged in the business, and all seem to have been uniformly successful. A gentleman writing from Spanish Fork, in that Territory, says:—"I have propagated the same worms for four years, and every worm spins. I have never seen any symptoms of disease among them."

We have received a sample of the cocoons raised by him, and should pronounce them of a good quality. The variety of cocoons cultivated is the same as is mostly cultivated in Asia Minor. The cocoon is of an oval or egg shape, pointed at both ends. There is much less gum or glue in this cocoon than in that of the French and most of the Japanese varieties, and hence the silk is more easily wound off or reeled.

Another correspondent from Salt Lake City says:—"I am fully convinced that this country is one of the best for producing eggs and silk. Our bench lands are remarkably good for fruits of most all kinds."

A writer in the *Deseret Evening News* calls attention to this subject and says: "With the sole view to promote the prosperity of the industrious and worthy pioneers of the Great West, I beg to furnish them, through your paper, a few valuable extracts from a most excellent elementary work, of 33 pages, on *Silk Culture*, from the pen of I. N. Hoag, Esq., editor *Pacific Rural Press*, and an extensive silk and mulberry culturist of Sacramento, Cal. Our dry climate and fruit-tree-growing soils are like those of Northern California, pre-eminently suited for the culture of silk and the production of marketable silkworm eggs, and in view of the enormous profits—the easy culture and easy facilities to transport to ready-cash markets the eggs and silk, I earnestly hope our people, in imitation of President Young, will engage in this lucrative business without further delay."

Thousands of mulberry trees and cuttings for silk culture are being shipped to Salt Lake from this State. The streets of Salt Lake City and the public and private grounds, these are also being ornamented with mulberry trees raised near Sacramento. The people of that city are combining the ornamental with the useful. They intend to clothe themselves with silk produced from the same trees that ornament their grounds and afford them protection from the sun. We hope success may attend their efforts in this worthy enterprise and we have no doubt of it.

Silk Culture in the Mining Counties.

A correspondent of the *Sacramento Union*, writing from Nevada city, takes the following very correct view of the culture of silk in the foot-hills and especially in that county:—

One of the hopeful indications of prosperity in the future is to be found in the attention now being paid to sericulture throughout the State generally and in this county especially. This subject has of late excited a deal of discussion among the shapers of public opinion. It is one of peculiar interest to the residents of the mining section, as it is generally conceded that the valleys cannot compete with the mountains in this respect—all the circumstances being favorable to the production of a superior quality of silk at the least expense in the latter locality. In the presence of existing facts, it is difficult to see where the opponents of the silk culture find there material on which to found their opposition. There can be no doubt of its success in this State. The question "will it pay?" has already been successfully answered. Those who pronounce it a failure should remember that they must prove either that silk can not be successfully produced, or that there

will be no market for it. As to the first, it has been already proved beyond a doubt that in no part of the world can the finest quality of silk be produced more readily than in our California mountains. As to the latter, perhaps some of the gentlemen who have no faith in silk will be kind enough to inform the public when the demand for it is likely to cease or grow less. With regard to the culture in this county let me cite a few

Items.

There are in this county at present, at the lowest estimate, in nurseries and plantations, over 100,000 mulberry trees. In this city and immediate vicinity some half a dozen different parties are engaged in the business. Among these are Ed. Muller, with a plantation of 6,000 trees and about 50,000 in nurseries; A. Isoard with a plantation of 6,000 or 7,000, and C. L. Dimon with a plantation situated between this place and Grass Valley of about 10,000. There are other plantations in this city and Grass Valley and in different parts of the county which will easily swell the figures to the amount stated. Many more already existing in contemplation will soon become substantial realities. The many testimonials as to the quality of the silk produced here, from those most conversant in such matters in quarters where sericulture is best understood, shows conclusively that it is nowhere excelled. Muller and Isoard were the pioneers of sericulture in this county, and it is especially owing to the perseverance and earnestness of the former gentleman that its success in this State has been assured. One of the important considerations of sericulture is, that it opens a new field for the profitable employment of women and children. Look at the girls everywhere growing up through our mountains! It is necessary that many of them should support themselves, but they can't all become schoolma'ams at present—the only manner in which your California girl dreams of obtaining a livelihood. Hence the advantages of a branch of industry which may find them pleasant and profitable employment.

Domestic Sugar Culture.

Though the Alvarado Sugarie has proved so successful, and some movements are recorded at Sacramento and San José, nothing seems likely to be done this year, beyond Alvarado, except raising beets for next year's seeding. We regret to learn that Mr. Wadsworth's efforts to secure the subscription of a capital of \$25,000 for putting up works to make sugar from watermelons have thus far been unsuccessful; but it is not yet too late to initiate the enterprise. The undertaking has no risk, because if only syrup he made, its delicious flavor will secure an eager market, as in Italy. It requires only very simple works, such as can be put up in two months; and by additions, beets can be added next year, for the sugar of each is alike when refined. There is very great economy in the co-working of beets and melons. Between them the sugarie can be kept in work the year round; and melon refuse makes a palatable variation in the feed of stock.

Beets give no syrup for family use, while melons will supply any demand that may be made. There is no oil from the olive which is more tasteful than the table oil made from melon seed. We commend this enterprise to our friends; and we trust that Mr. Wadsworth will yet succeed in forming the company.

VITALITY OF REDWOOD TREES.—Redwood forests, says Mr. Bolander, are not destroyed by fire, which may burn up all the leaves and branches, but the tree will send forth new shoots from its charred trunk and limbs. Trees which have been cut down and allowed to remain on the ground, have formed, after a few years, new growths of young trees, which have grown into forests; anything left of a redwood tree will sprout again; it is therefore a difficult task to clear land overgrown with this timber. This tree is now largely cultivated by the Italian government on account of its many good qualities.

E. S. RITCHIE, of Boston, has lately made the most powerful induction coil now existing.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office.

ALVARADO, March 13, 1871.
MESSRS. DEWEY & Co.,—Gentlemen: I am happy to acknowledge the receipt of my letters patent on Mop Holder. I am entirely satisfied with the manner in which you conducted my case. I can assure you that I shall not fail to recommend your method of business to all others having patents to obtain. Yours, etc., JNO. BRIZEE.

PERSONAL.—Wm. H. Murray, representing the SCIENTIFIC PRESS, of San Francisco, California, called on us this week. He is visiting the principal manufacturing points in the United States in the interests of said journal. The Press is a fine looking sheet, same size as the *Scientific American*, and is now in its 22d volume.—*Iron World*, Pittsburgh.

1000 Farms

In Los Angeles County,
For Cotton, Wheat, Corn, Grapes, Oranges, etc. The "Ahe! Staurus Ranch," 200 square miles in sections, quarter sections, etc., on Government system of survey, forming blocks one mile square, with road on each side, fronting on the ocean, the railroad to San Francisco to pass through them, the unsold portions subdivided, for sale on long credit, or rent. The famous Anaheim is on this tract. For Maps, Circulars, etc., apply to E. F. NORTHAM, 432 Montgomery st., San Francisco, or TIMO, LYNCH, at Anaheim and Los Angeles. 1v22-5ms

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

FOUR MONTHS' SUBSCRIPTION for \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

SALT LAKE CITY.—Chan, Reticker is agent in Salt Lake City and vicinity for the SCIENTIFIC PRESS and PACIFIC RURAL PRESS.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MULLER'S BRAZILIAN SPECTACLES are just the things for people fond of reading whose eyesight is beginning to fail. His great skill as an optician enables him to suit all conditions of sight. It is Muller who supplies the city with opera glasses.

The Illustrated Excelsior Magazine

Has been reduced from \$2.50 to \$1.00, and is now one of the CHEAPEST in the world. The illustrations alone are perhaps worth more than the cost, and the beautiful STEEL ENGRAVING of Evangeline (postage, etc., being sent) is given. Size of paper on which the steel engraving is printed is 2 feet by 19 inches. The Magazine contains Stories, Pictures, Puzzles, Music, a Lady's Department, with illustrations of ladies' patterns; a Youth's Department, etc., etc. I hereby specially offer the Magazine for One Year also this splendid steel Engraving, for the regular subscription price, \$1.00 and 8 cents for postage and packing of engraving on rollers. Sample copy 10 cents. Address the Publisher, C. L. VAN ALLEN, 171 Broadway, New York. ma25-4f

LEA & PERRINS' WORCESTERSHIRE SAUCE.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle. Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, and by which the Proprietors, Worcester, Crossed, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-1yeow

Eighth Industrial Exhibition,

UNDER THE AUSPICES OF

THE MECHANICS' INSTITUTE,

San Francisco,

WILL OPEN

Tuesday, August 10, 1871,

And continue for four weeks, in the Pavilion of the Society, on Union Square, in the city of San Francisco.

APPLICATION FOR SPACE can be made at the Library of the Mechanics' Institute any day, between the hours of 1 and 9 P. M., or by letter to the Corresponding Secretary, H. C. KIBBE.
Mr. J. H. GILLMORE is authorized to visit those who intend to exhibit from this city. fcl8-16p-4f

A NEW ARTICLE.

Composition Pipe for Conducting Water.

The attention of Railroad Companies, farmers, dairymen and others, is called to our new Pipe for leading water. It is lighter than ordinary lead pipe, and much cheaper than iron, will stand a heavy pressure, and deliver about one third more water than iron pipe, provided the sizes are the same.
We are now manufacturing all sizes, from half-inch to two-inch, and can fill large orders at short notice and put on reels for shipment, the same as lead pipe. Samples can be seen at our office.

LANE & BODLEY'S

PORTABLE STEAM ENGINES.

From eight to twenty-five horse power, adapted to Farm, Plantation, Saw and Grist Mill use. OUR PORTABLE ENGINES excel in having capacious wrought iron Steam Domes, with Man Head giving free access to the boiler, wrought iron Smoke Head, Lift and Force Pump, and for beauty of design and efficiency.

Also, Stationary Engines, Boilers, Saw Mills, Shafting and Wood-working Machinery.

AGENTS. Catalogues furnished on application.
W. L. Cushing, New Orleans; John P. Dale, Nashville, Tenn.; C. S. Warner & Son, Detroit; LANE & BODLEY, John & Water St. Cincinnati, O.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE RANSOM PATENTS, the most perfect SANDSTONE, specimens of which may be seen in the ornamentation of Dr. Stone's Church, now in course of erection, at the corner of Post and Mason streets. For architectural, ornamental and mechanical purposes, this stone surpasses all natural stone of its class.

SANDSTONES from this factory, which we make of any desired size, may be seen at many of the great mechanical shops in this city, where they are held in high esteem.

The factory is now turning out Architectural Stone, Cemetery Stone, Grindstones, Garden Ornaments, in the way of Vases, Fountains, etc. The nature of the art admits of our moulding the stone in any desirable form, and enables us to compete successfully with all natural stone wrought by hand. In England, where the stone has been manufactured largely for the past fifteen years, it is considered for durability and strength, to surpass the best English Sandstone. The British Government employs it largely in its public buildings, both at home and in its Colonies; and as we have secured the services of MR. ERNEST L. RANSOM, late Superintendent of the home works at Greenwich, England, we are turning out stone fully equal to the English standard.

For particulars, apply at the Factory, corner Turk and Larkin streets. mal8-4f.

Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CAYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction, not likely to get out of order, and very durable.

It is Very Efficient

and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer,

D. V. PHELPS,
San Leandro, Alameda County, Cal.

All Adze-Eyes, of Superior Quality.

13 AND 15 FREMONT STREET, AT NELSON & DOBLE'S, SAN FRANCISCO.

Westfall's Improved Potato Digger.

We ask special attention to this practical and useful invention. Nearly every farmer has felt the want of a machine to dig potatoes. This new invention fully supplies that want. The machine being made entirely of iron and steel, will last longer than the farmer who buys it. It is operated by a man and one or two horses, and digs one row at a time. The shovel part of the digger enters under the potatoes and raises them on to the fingers in the rear, where the dirt falls through and the potatoes roll back on to the surface of the ground. The machine is prevented from clogging by a reel which revolves above the fingers and carries through the potato vines, weeds, etc. A complete model can be seen in our office. Full particulars in regard to Machines or Rights furnished on application.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific Coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.

A few good traveling agents wanted to sell this and other valuable patents.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new, it has been thoroughly tested, and we have strong testimonials in its favor from many of the most substantial men of the East.
We invite manufacturers and others to call at our office and make their own investigations.

New England Spring Bed.

The cheapest and best in the market. Rights for sale and beds at cost. Send for descriptive circular.

Tarbox's Combination Stencil Alphabet.

By the use of this ingenious device, ANY NAME OR NUMBER can be marked well and perfectly, thus saving the necessity of having a number of different plates. The exclusive right to sell said invention in California, and also a small stock of Plates, for sale at a low price. Send for Circular, or call and examine the Plates.

Nut Roaster.

This machine will roast one quart or half a bushel of nuts at once. All that is required is to wind it up and fill with nuts. It roasts evenly and perfectly and will keep nuts warm a whole day and not burn them. The Patent Right to any town or city in the States of California and Oregon, and Washington Territory.
A sample machine furnished to each purchaser. apl-tf-r

Chlorination and Concentration.

The subscriber is prepared to erect chlorination works at mine on a scale adequate to the wants of the mine, for working daily one-fourth, one-half or one ton of sulphur etc. Will cost \$500 to \$1,000 in complete working order. Will erect and run them until compensation is received from the sulphurets worked, allowing \$6 to 90 per cent. of fire assay value, less ordinary cost per ton for working. Will also erect concentrating machinery simple, efficient and inexpensive.
Also, erect cheap and efficient stamp mills suitable for prospectors. Have one which has been running four months, of three stamps, costing less than \$600.

THE
ASPHALTUM PRESSURE PIPE
COMPANY,HAVING ERRECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,Are now Prepared to Take Orders
AND MAKE CONTRACTS.This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.

ranted equal to new. Orders from the country promptly
attended to. 9v19-qy

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

Blakslée & Williams' Patent.—For
Water, Oils, Acids, Etc.The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
bolts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with four water; cost much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Selfies made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

General Agents for the
**NATHAN & DREYFUS
SELF OILERS.**

These Oil Cups are too well known
to require any lengthy description;
the following are the main points
of advantage.

We guarantee a saving of
75 PER CENT OF OIL.

They are composed of a transpa-
rent Glass Cup, mounted in Brass,
provided with a hollow tube, inside
of which is placed a loose acting
solid or hollow wire, which acts as
a Feeder and Regulator. The wire
rests constantly upon the Journal,
thereby acting with the bearing in
its motion. The wire is so regu-
lated inside the tube as to feed ac-
cording to the demand only. There
is no flow of oil whatever while the
machinery is not in motion.

They are as reliable in Winter as in Summer.
Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' con-
stant use.
They are constructed in a very neat and substantial manner.
We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give
perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position
or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you
desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal
that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed
NATHAN & DREYFUS, New York, Jan. 1st., 1871.

**WE ARE ALSO GENERAL AGENTS FOR THE
GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.**

After an experience of eleven years in the manufacture of the above Governor, during which time several im-
portant improvements have been made
and two additional patents obtained
we feel justified in recommending it
to all parties using Steam power, and
warranting it to be the most perfect
regulator in the market.

The Gardner Governor is so well
known that we think it unnecessary to
enter into a detailed explanation of the
principles involved, or details in its
construction, merely giving the leading
objects realized by this important in-
vention. The Governor combines with
the greatest simplicity of construction,
accurate regulation of speed, pos-
itive insurance against all accidents
liable to occur from shipping or parting
the Governor or driving belts, and a
convenient arrangement for adjusting
the speed of the Engine while in mo-
tion, without change of pulleys.

The construction of the Governor is
extremely simple, having no springs,
inside joints, swivels or parts liable to
disarrangement, all the several parts
are duplicates of each other in the same
series; the most skillful workmen are
employed, the best material used and
the machinery employed especially
adapted to their manufacture. Thus

we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheer-
fully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.
When ordering, be particular to say Governor with THROTTLE VALVE on WITHOUT THROTTLE VALVE; and either
BLACK OR FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup
to the public, we desire to call
very particular attention to its
many special advantages.

FIRST.—Nothing but clean oil or
tallow is admitted into the Cylin-
der; no lime or sediment of any
kind.

SECOND.—Its great economy of
both tallow and fuel.

THIRD.—It is self-acting, and
supplies the lubricating material
only while the Engine is in
motion.

FOURTH.—Its certainty and regu-
larity of feeding, and increase of
the power of the Engine.

The principle upon which this
apparatus is founded is that, in-
stead of admitting tallow into the
Cylinder in considerable quantities
at uncertain intervals by means of
tallow cups, grease cups, and other
crude contrivances, and allowing
it to be instantly blown out at
the exhaust (as must necessarily
be the case), this cup, by its pecu-
liar action, delivers the lubricant

in drops into the body of the
steam, which thereby becomes
thoroughly impregnated or greased
before passing into the steam chest
or Cylinder; the consequence is,
that instead of falling to the bot-
tom of the Cylinder, as it does
when admitted through a tallow
cup (which passes the lubricant
from the bottom of the cup to the
Cylinder), it enters into the form
of minute globules, and hence the
whole of the internal parts of the
engine become regularly and con-
stantly greased. The result of its
action has been proved in a very
great number of cases to be an
enormous saving of tallow, a con-
siderable increase in the power of
the engine, a great saving in fuel,
and reduction of internal friction
to a minimum.

These Lubricators will save you
15 per cent. of the Lubricating
Material, and cost no more than
the common Compression Cups.

The above Goods are Sold at
Factory Rates.

For Price Lists or information address **DARLING & Co., 629, Washington Street,**
San Francisco, California.

Traveling Agent—**R. K. COLCORD.**

**THE WILSON
Patent Steam Stamp Mill.**

This extraordinary Mill, now so justly popular in the
East, is now offered to the miners of the Pacific Coast.
Having been in operation now for about two and a
half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill
that has had the severe ordeal of practical working, and
proved itself eminently successful. It is now in opera-
tion in several of the Eastern States and Territories, and
gaining an envious popularity. The whole machine is
so simple as to be readily understood by the most ordi-
nary minds. In fact, its simplicity is its durability.
The expense of crushing rock or cement with this Mill
is less than one-half the expense of any other Stamp
Mill, and less than one-half the cost. For further par-
ticulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of **THE WILSON STEAM STAMP MILL CO., 326**
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manu-
facture or use any Steam Stamp Mills that are an in-
fringement on the Wilson Patents, as they will be
prosecuted to the utmost rigor of the law.

Another Shake—A Suggestion.

Last Sunday, the earthquake returned from its trip to the East, and favored us with a couple of shakes which did no further injury than to frighten a number of people. The shocks were felt more severely on the other side of the Bay, it is stated, and were experienced along the peninsula south; and also to the north.

We have for several years tried to make up a tabular form of the times at which the various shocks have been felt in different places, so as to determine the center of disturbance, the rate at which the shocks travel, etc. But this is impossible on account of the great variation in the times as given. We think that it would be an excellent idea to have the times of various localities corrected to a standard by telegraph, which can easily be done, and thus we might be able to deduce many facts of interest and importance on the subject. There is no country subject to the shocks which has such telegraphic advantages as we have, and it is a pity that California should not benefit by its opportunities to teach the world something in this respect. We commend the matter to the consideration of intelligent men on the coast.

S. F. ART ASSOCIATION.—This new association is rapidly getting under way. A special meeting is called for Tuesday, the 11th inst, at 7 P. M., to be held in a room adjoining the library of the Mercantile Library Association, for the election of members and other business. A full attendance is requested. All lovers and patrons of art desiring membership should send in their names to any one of the members or officers of the Association, or, if not personally acquainted with them, to the Secretary, Frederick Whympier, room 11, Donahoe's building.

CALIFORNIA PACIFIC RAILROAD.—The steamers recently purchased by this company, commenced running under the new management on the 1st inst. The time table shows no change. The *Chrysopolis* and *Yosemite* are on the Sacramento route; and the *Amador* and *Julia* on the Stockton route. The rates of fare to Sacramento and Stockton will be \$1 50 for cabin and \$1 for deck passage, and to Benicia and Suisun, \$1. Rates for freight have been fixed as follows: To Sacramento, \$2 50; to destination for interior points, \$2; Knight's Landing, \$3; Colusa, \$5; Tehama, \$9; Red Bluff, \$12; Stockton, \$2 per ton.

PLOWING IN THE MOUNTAINS.—The *Alpine Chronicle* says: "Our farmers are all busy plowing and putting in their crops. If they do not find a home market next fall for all their products, it will not be because our mining prospects at this time do not warrant a belief that their hopes in this particular will be fully realized." The mountain farmers are happily free from the dangers and damage from drouth which lately so seriously threatened the farmers of the great valleys of the interior and Coast Range.

Improved Hay Rake.

Among the late improvements which California has made in agricultural implements, improvements which have an actual importance for all on our coast in that they aid in the production of the country, an improved hay rake, recently patented by Mr. O. Bonney, Jr., of this city, deserves attention.

This rake is designed for gathering hay or gleanings on any ground, and from its construction, it is claimed, will save double the amount of hay on rough land that can be saved by either the old revolving or the wire tooth rake, besides delivering the article in a superior condition. It is, moreover, very easily handled by both man and horse. The illustration gives a good idea of the device, several of the important points of which may here be touched on.

THE BONNEY PATENT IMPROVED HAY RAKE.

The teeth are adjustable, being held in a malleable shank by set nuts, and can be run out as they become worn, two feet being the length generally used. This is an advantage over stationary teeth which, when worn one season, become so short often that their holding capacity is very limited. The teeth, moreover, are double-pointed, so that they can be changed, point for point, giving the advantage of two sets of teeth.

The spring bar, A, held by the steel spring, B, and a thumb-nut, is designed more especially for cocking or bunching hay, but can be used to advantage in raking any ordinary ground. On very rough ground, the bar should be thrown off, which is done quickly by turning off the thumb-nuts, and raising the lower end of the springs. The bars which hold the teeth are changeable in the frame, allowing the required inclination of the teeth to the ground.

The dumping arrangement, connected with the seat, and operated by the driver's weight, allows one to handle the rake with the greatest ease, being connected with the

lifting beam, C, through the changeable link or strap, I, so as to suit the weight of the party driving. The hand lever, O, is thrown under the seat to take the weight of the driver when simply raking, an operation represented in the cut.

There are several other points in the machine for which superiority is claimed. This rake is now in use at Sherman Island and about Rio Vista, raking tules and working in localities where other rakes have been found impractical. It took the first premium at the last State Fair in Sacramento. Patented Nov. 23, 1869, and Jan. 31, 1871.

The manufacturer is Mr. O. Bonney, corner of Mission and Beale streets, San Francisco, whom address for further particulars.

Steam Plow for Tule Lands.

We have seen the drawings of a new steam plow designed by Mr. George L.

Pierce of this city, and would advise those interested in such matters to visit the Miners' Foundry, on First street, and examine the plans. Mr. Pierce is desirous of securing some aid in order to enable him to put a machine on the market. He is a gentleman of large experience as mechanical engineer, has worked for years at his profession, and appears very well informed. We are unable to devote to his invention the space which it deserves, but would desire to call attention to it. We need greatly some machine of the kind, and may have a very effective one in this, which certainly is worth examining.

A CHANCE FOR MINERALOGISTS.—Messrs. Riotte and Luckhardt showed us lately at their Nevada Metallurgical Works, on First street, near Market, (Golden State Foundry,) a couple of cases of a large mineral cabinet which has been placed there for sale. The collection was many beautiful crystals of foreign ^{rs} ^{ers} and also, what is more interesting, the ^{rs} ^{ers} of all the new minerals and of ^{rs} ^{ers} of our coast. The collection was made by a person of extensive mineralogical knowledge and has been judiciously selected, certainly as far as we can judge from the portions shown us. We are told that it will be sold at a very moderate price. Particulars can be obtained by calling at the place or by addressing Mr. Riotte.

ACADEMY OF SCIENCES.—At the meeting, last Monday, Mr. E. Durand presented specimens of chrome ochre and of cinnabar with asphaltum from the New Almaden mines; also a compound of the sulphates of the binoxide and the protoxide of mercury which is found in the condensing chambers of the quicksilver furnace. Remarks on the earthquake, which occurred here last Sunday evening, were made, and there followed rather an unprofitable discussion as to the cause of earthquakes. A species of small crab, found in Half Moon Bay, was presented by Dr. Gibbons. Dr. Cooper was elected Corresponding Secretary *pro tem*.

SAN DOMINGO.—A certain C. C. Fulton has published what is called the basis of the report of the San Domingo Commissioners. According to this, "every question of enquiry can only be answered in the most favorable manner as to people, soil and climate." As the people are of excellent character, according to the "basis," we are at a loss to understand how the land can be "cursed by man." We fear us that Mr. Fulton is an optimist. The people are represented as anxious for annexation. This may be so, although there are reports to the contrary. But we are very doubtful as to what we should gain thereby.

IMPORTANT RAILROAD NEGOTIATIONS.—The report is circulated that negotiations are in progress for the purchase of the S. F. and Northern Pacific Railroad by the Cal. Pacific.

Pierce of this city. It is intended for use on tule lands and has a number of peculiarities which, it is believed, will render it particularly serviceable for its intended purpose. The engine and boiler are made of a peculiar construction, with the purpose of obtaining the minimum of weight with the greatest stability and power. The device is not intended as a locomotive, but is to be drawn by horses, all the power of the engine being devoted to driving the cutters. The revolving cutters are driven by chain gearing. They consist of thin saw-blades mounted on a shaft in such a way as to be stiff while they can easily be replaced when necessary. These cut parallel furrows. Bolted on to these are curved cross-cutters, also of thin metal, arranged so as to cut in a spiral, there being three, or perhaps four, rows of these last. The cutters are driven at a high rate of speed and cannot well clog, while they must apparently chop up the tule into fine pieces. They can be raised or lowered so as to cut as deep or as shallow as may be desired. From the drawings and the description given us, we are disposed to view

MECHANICAL PROGRESS.

TILGHMAN'S STONE CUTTING PROCESS.—

The *Journal of the Franklin Institute* for March says that Mr. B. C. Tilghman of Philadelphia shows that a jet of quartz sand, thrown by means of steam at high pressure, will bore an inch and a half hole through a block of corundum, (nearly as hard as the diamond) an inch and a half thick, in 25 minutes. He has applied the discovery to grinding or depolishing glass for ornamental purposes; using a moderate air-blast, instead of steam,—the spent sand being reconveyed to the upper part of the apparatus, and the resulting dust being drawn back into the fan and again forming part of the sand shower. Ten or fifteen seconds is time enough to completely grind the surface of ordinary glass. By covering parts of the glass surface by a stencil or pattern of any tough or elastic material, such as paper, lace, caoutchouc, or oil paint, designs of any kind may be engraved. There is a kind of colored glass made by having a thin stratum of colored glass melted or "flashed" on one side of an ordinary sheet of clear glass. If a stencil of sufficient toughness is placed on the colored side, and exposed to the sand blast, the pattern can be cut through the colored stratum in from four to twenty minutes, according to its thickness. The theoretical velocity of a current of air of the pressure of 4 inches of water, he calculates, is (neglecting friction) about 135 feet per second; the actual velocity of the sand is doubtless much less. If a current of air of less velocity is used, say about one inch of water, very delicate materials, such as the green leaves of the fern, will resist a stream of fine sand long enough to allow their outlines to be engraved on glass. By graduating the time of exposure with sufficient nicety, so as to allow the thin parts of the leaves to be partly cut through by the sand, while the thicker parts of the ribs and their branches still resist, the effect of a shaded engraving may be produced. The grinding of such a hard substance as glass by an agent which is resisted by such a fragile material as a green leaf, seems at first rather singular. The probable explanation is, that each grain of sand which strikes with its sharp angle on the glass pulverizes an infinitesimal portion which is blown away as dust, while the grains which strike the leaf rebound from its soft elastic surface. The film of bichromatized gelatin, used as a photographic negative, may be sufficiently thick to allow a picture to be engraved on glass by fine sand, driven by a gentle blast of air. For cutting stone the inventor uses steam as the impelling jet; the higher the pressure, the greater is the velocity imparted to the sand, and the more rapid its cutting effect. In using steam of about 100 pounds pressure, the sand is introduced by a central iron tube, about 3-16 inch bore, while the steam is made to issue from an annular passage surrounding the sand tube. A certain amount of suction of air is thus produced, which draws the sand through the sand tube into the steam jet, and both are then driven together through a tube 6 inches long, in which the steam imparts its velocity to the sand, and finally strike on the stone, which is held about an inch distant from the end of the tube. Under favorable conditions, using steam which he estimated as equal to about $1\frac{1}{2}$ horse-power, at a pressure of 125 pounds, the cutting effect per minute was $1\frac{1}{2}$ cubic inches of granite, or 3 cubic inches of marble, or 10 cubic inches of soft brown sand stone. By means of flexible or jointed connecting tubes, the blast pipe is made movable in any direction; grooves and moulding of almost any shape can thus be made, or by means of stencil plates, letters or ornaments can be cut either in relief or intaglio, with great rapidity in the hardest stone. At a high velocity quartz sand will cut substances much harder than itself as before stated. A hole 1 inch long and $\frac{1}{4}$ inch wide was cut through a hard steel file, $\frac{1}{4}$ inch thick, in 10 minutes, with a jet of 100 pounds steam. A stream of small lead shot, driven by 50 pounds steam, wore a small hole in a piece of hard quartz; the shot were found to be only very slightly flattened by the blow, showing their velocity to have been moderate. Among the curious examples of glass cut by this sand blast was shown a piece of ordinary window glass, which, having been partially protected by a covering of wire gauze,

had been cut entirely through, thus producing a glass sieve, with openings of about 1-12th of an inch, the intervening glass meshes being only 1-16th of an inch wide.

IMPROVEMENT IN HEAVY ORDNANCE.—

The following description of Col. Terrell's perforated reinforce gun, for the manufacture of which a joint-stock company is now organizing in Washington, is from the *Scientific American* of March 25th: "The part which contains the bore is a steel cylinder, cast with walls of a uniform thickness of two inches, which secures homogeneity in the casting, and provides against cooling strains and flaws. To receive this steel barrel, an iron reinforce of great thickness is cast, with a caliber a little less than the entire diameter of the barrel. In the walls of the reinforce are eight rows of perforations, having the outlines of truncated cones, disposed in equilateral triangles, the small end of the openings, two inches in diameter, being upon the internal surface of the reinforce. These perforations and the bore are formed by cores, fixed on the flask or pit when the metal is cast. By thus multiplying the cooling surface, the requisite tensile strength may be obtained with less danger of flaws and neutralizing strains, when the mass of metal 'sets,' as all foundrymen know. To receive the steel barrel, the reinforce is expanded by heat. It may be cast in sections, thus saving the great inconvenience attending the handling of the same if cast entire, and, in case of flaws in the casting, involving only the loss of the section in which they occur. The barrel, when inserted, is firmly compressed as the iron cools, but since it is not otherwise secured, its longitudinal expansion, from the heat of discharges, is not so cramped as to cause a rupture. The radial expansion of heat is partly provided for by the elasticity resulting from the internal support received from the reinforce; but in this regard the main reliance is upon the immense radiating surface, penetrating to the very core of the gun, and preventing the accumulation of heat, at the dangerous points within the walls. A gun thus constructed will, it is claimed, stand the rapid and continuous firing of solid shot indefinitely, without danger of bursting. The theory is, that the rapid firing of a thick-walled gun, made after any of the present models, must produce a degree of heat sufficient to cause unequal expansion in the mass of metal, and thus create cracks, or at least, strains that will result in rupture by the pressure of subsequent discharges. The inventor believes that durability can be obtained by providing for the escape of this force, and that his perforated reinforce supplies this provision."

PETROLEUM AS FUEL.—This problem seems in a fair way of solution,—says the *Chicago Mail*. The new apparatus "consists of a cylinder, like a small locomotive boiler set on end, with a smaller cylinder within it, the intervening space being filled with petroleum. The smaller cylinder is filled with six hundred small copper tubes, and through these the superheated steam passes, producing vapor from the oil that fills the interstices between the tubes. This vaporized oil rises through a layer of prepared sponge, and just at the point of exit is mixed with superheated steam in any required proportion, thus producing hydrocarbon gas. This gas passes through iron tubes to the point where the fuel is needed, and is there burned, very much like common gas. In the case which was shown, the kiln was filled with stone, and in a very short time after the fire was lighted the heat was more intense than can be expressed by comparison. All this time the fire was under perfect control, and by a simple turn of a screw the combustion was made more or less intense."

TEST OF THE 35-TON GUN.—This monster has been fired with an elongated shot of 700 lbs. weight. Says the *Mechanics' Magazine*:—"The highest velocity attained, 1,370 feet per second, was produced by 120 lbs. of powder, and this will no doubt be fixed upon as the regular service charge. The new gun has (at the time we write) fired eight rounds of high charges, ranging from 75 lbs. up to 130 lbs. The velocities attained with charges of 75 lbs. and 100 lbs. of powder were respectively 1,160 feet and 1,250 feet, the penetrating power of the projectiles with the latter being so great that an armor-plate of 13 inches in thickness would only just arrest them at close quarters."

SCIENTIFIC PROGRESS.

A CONSTANT FORM OF DANIELL'S BATTERY.

Sir W. Thomson has devised a form of this battery which will last for years—the only limit being the falling to pieces of the zinc. A late number of *Nature*, copies the paper in which he described it to the Royal Society. We give an extract:—"The cell is of glass, in order that the condition of the solutions and metals which it contains may be easily seen at any time. It is simply a cylindrical or rectangular jar with a flat bottom. It need not be more than ten centimetres deep; but it may be much deeper, with advantage in respect to permanence and ease of management, when very small internal resistance is not desired. A disc of thin sheet copper is laid at its bottom. A properly shaped mass of zinc is supported in the upper part of the jar. A glass tube (which for brevity will be called the charging-tube) of a centimetre or more internal diameter, ending in a wide saucer or funnel above, passes through the center of the zinc, and is supported so as to rest with its lower open end about a centimetre above the copper. A glass siphon with cotton-wick core is placed so as to draw liquid gradually from a level about a centimetre and a half above the copper. The jar is then filled with semi-saturated sulphate of zinc solution. A copper wire or stout ribbon of copper coated with india-rubber or gutta percha passes vertically down through the liquid to the copper plate below, to which it is riveted or soldered to secure metallic communication. Another suitable electrode is kept in metallic communication with the zinc above. To put the cell in action, fragments of sulphate of copper, small enough to fall down through the charging tube, are placed in the funnel above. In the course of a very short time the whole liquid below the lower end of the charging tube becomes saturated with sulphate of copper, and the cell is ready for use. It may be kept always ready by occasionally (once a week for instance) pouring in enough of fresh water, or of water quarter saturated with sulphate of zinc at the top of the cell, to replace the liquid drawn off by the siphon from near the bottom. A cover may be advantageously added above, to prevent evaporation. When the cell is much used, so that zinc enough is dissolved, the liquid added above may be pure water; or if large internal resistance is not objected to, the liquid added may be pure water, whether the cell has been much used or not; but after an interval, during which the battery has not been much in use, the liquid added ought to be quarter saturated, or even stronger solution of sulphate of zinc, when it is desired to keep down the internal resistance. It is probable that one or more specific gravity beads kept constantly floating between top and bottom of the heterogeneous fluid will be found a useful adjunct, to guide in judging whether to fill up with pure water or with sulphate of zinc solution. They may be kept in a place convenient for observation by caging them in a vertical glass tube perforated sufficiently to secure equal density in the horizontal layers of liquid to be tested by the floaters. * * * Two or three cells, such as the one shown to the Royal Society, will be amply sufficient to drive a large ordinary turret-clock without a weight; and the expense of maintaining them will be very small in comparison with that of winding the clock."

HECKEL ON ARCHIOGENESIS.—Prof. Hæckel, of Jena, has done more than any other observer,—says "E. R. L." in *Nature* for March 2d,—to establish the Protoplasm theory by his discovery of organisms of the simplest conceivable structure,—that is, not even possessing a differentiated central nucleus,—and his remarks upon the present condition of the Spontaneous Generation question must possess great weight." The following is a quotation from a recent work by him: "Since in our chemical laboratories, with our exceedingly limited and rough methods, we have succeeded in forming many Carbon-compounds, and have good reason to suppose that we may one day synthetically produce albuminoid bodies, it is not reasonable to suppose that in the great laboratory of Nature, similar but more complex chemical synthesis may go on, such as the formation from inorganic materials of albuminoids and of living protoplasm? If we are to call in a special creative act—superior to mere chemical synthesis—to account for the ex-

istence of Protoplasm because we have not succeeded in forming it artificially, so also must we postulate a peculiar creative act for a great variety of minerals, such as feldspar, fluor spar, heavy spar, augite, &c., since we are equally unable to build up these inorganic bodies. In this way we should divide the whole world into a Natural and a Supernatural group. The former would contain such salts, gases, &c., as we can build up in the laboratory, also alcohol, acetic acid, &c. All these bodies have arisen by Archigenesis, i. e., by natural, mechanical means, solely by the interaction of the inherent physical and chemical forces of their matter. The latter group would contain all minerals not yet formed in the laboratory, also all the complex Carbon-compounds. These bodies would be considered as arising by "Creation," that is, by supernatural means, through a means, through a mysterious creative force existing externally to the bodies. To every philosophic naturalist such a view must appear as untenable as is every assumption of a "Creation." On the other hand the assumption of an Archigenesis for the first living beings from which all others have developed, is a logical postulate of the human intelligences."

THE POLARITY OF THE COMPASS PLANT.

In the *American Naturalist* for March, W. F. Whitney gives a brief history of the discussion upon this plant, and Dr. Gray's explanation of the fact that the radical leaves always present their edges north and south. We quote: "In November last, Dr. Gray received a letter from Mr. Charles E. Bessey, of the Iowa State Agricultural School, in which he says: 'We have the curious 'Compass Plant,' *Silphium laciniatum*, growing in great abundance throughout all this region. The polarity of its leaves is very marked. Use is made of it by the settlers when lost on the prairies in dark nights. By feeling the direction of the leaves they easily get their bearings.' From the record of these observers there can be little doubt that the leaves on the prairies do assume a meridional bearing; and the cause assigned for this by Dr. Gray is undoubtedly the correct one, viz.: that both sides of the leaf are equally sensitive to light. It only remains to be shown what renders its two sides thus equally sensitive. It is well known that the two sides of a leaf usually differ in structure, that the number of stomata, or breathing-holes, is much greater on the under than the upper surface; and that the tissue of the upper is denser than that of the lower stratum. As the two surfaces of the *Silphium laciniatum* appeared somewhat alike, Dr. Gray suggested that it would be well to examine the leaf microscopically in order to see if it corresponded with ordinary leaves in the above respects, or with truly vertical leaves, the two surfaces of which are usually similar or nearly so; also to compare with it the leaves of other species of *Silphium*, in which no tendency to assume a north and south position is shown. * * The observations recorded appear to show that the meridional position of the edges of the leaf is to be explained by the structure of the two surfaces, which being identical, at least in the important respect of the number of the stomata, seek an equal exposure to the light—the mean position of equal exposure, in northern latitudes, being that in which the edges are presented north and south, the latter to the maximum, the former to the minimum of illumination."

LARGE INDUCTION COIL.—W. H. Wahl,

Ph. D., describes, in the *Journal of the Franklin Institute* for March, the induction coil recently constructed for Prof. Morton by E. S. Ritchie, of Boston. It is believed to be the most powerful one now existing. The mammoth coil built for Prof. Pepper by Mr. App, of London, "was nine feet in length, contained 150 miles of wire, and weighed nearly a ton. With a battery of sixty elements, this coil yielded for a while sparks 29 inches in length, but soon failed, and is now, we understand, taken to pieces. The coil, however, now described, containing but $44\frac{1}{2}$ miles of wire, 40 inches in length, and weighing about 250 pounds, gives, with but three cells of battery, sparks 21 inches in length, and after several months of constant use and severe tests, is in perfect condition. * * The battery for exciting this coil consists of three glass jars, 10 inches in diameter and 12 inches high, into which are lowered, by means of a windlass, plates of carbon and zinc, 8x10 inches, five of each occupying each jar. The liquid employed is the mixture of potassium bichromate, water and sulphuric acid, now employed in several forms of battery.

CORRESPONDENCE.

Notes of Travel in Amador County.

[Written for the Press.]

Ione City—Sutter Creek.

Ione City, situated 38 miles from Sacramento and 12 miles from Jackson, the county seat, contains about 300 inhabitants. The valley in which it is situated is very beautiful and productive; but the legalizing of a "Spanish grant," which covered this side of the county, has almost paralyzed its inhabitants. Paying for land a second time at an exorbitant figure explains itself. Some years will elapse before it will have recovered fully.

The Broom and Match Factory at Ione City, owned by John Kirk, Esq., manufactures 3,000 dozen of brooms and 5,000 gross of matches annually.

Hall & Co.'s grist mill, at the same place, has three run of buhrs, driven by an engine of 60 horse-power. Its capacity is about 75 barrels of flour and 50 tons of ground feed daily. About three tons of lignite are used daily for the engine. A mine of this fuel is situated in close proximity to Ione City, and is owned by F. C. Hall. The stratum is from 3½ to 9 feet thick, and can be traced for 10 miles in extent; it lies horizontal, and in many places near the surface.

Sutter Creek, four miles north of Jackson, contains something over 2,000 inhabitants. It is the largest town in the county. Its citizens have just completed one of the finest brick school-houses in the county, if not in the interior of the State, for the education of the rising generation. The structure is 35x55 feet, two stories high, and cost \$10,000; 200 pupils are in daily attendance, and two competent teachers are in charge. This district contains 253 children.

In the Sutter Creek foundry and machine shop, owned and superintended by S. S. Manon, ten men are regularly employed, and for their capacity, they turn out as good work as the larger institutions of the State of the same kind.

Volcano and Vicinity.

Volcano, situated about 12 miles east of Jackson, contains 800 inhabitants. It is situated on what is known as the great lime rock range. Its mines have been worked continuously since '49.

The Amador County Canal and Volcano Ditch, both of which are owned by San Francisco capitalists, supply the district with water. They take their supply of water from the North Fork of the Mokelumne River. This canal was originally a flume, 31 miles in length, with a carrying capacity of 900 inches, and cost \$450,000. It is now being replaced by a substantial ditch. The latter (the Volcano ditch) cost in the neighborhood of \$200,000, and has a carrying capacity of 700 inches, the income of which satisfies its owners.

The following are among the best working placer claims here:—Adams & Co., Podesta & Co., Goodrich & Co., Whitney claims, and Colori & Co.; the latter named using a derrick and working six men. In five days run they washed out \$2,600.

The Marklee mine, owned by Marklee, Nichols & Hanson, is situated about four miles northeast of Volcano, and is considered the best mine in this vicinity. It has been developed to a depth of 300 feet, at which point the ledge will average from one and a half to three feet thick. The rock has averaged from \$30 to \$60 per ton.

The Rodgers mine, owned by the same parties, and situated one mile west of the Marklee mine, promises to equal, if not excel, the former.

The Old Sorocco mine on Elses Creek (in the vicinity), is now being worked by Messrs. Woodcock & Co. The last run of rock taken from the mine, averaged \$60 per ton.

The Douglass mine, on Elses Creek, and the Grass Valley mine on Grass Valley Creek, are both laid up for the present, their owners, Messrs. Sorocco & McLaine, having applied for a U. S. patent for each of them.

Jackson and Vicinity—A Big Ditch.

The Sutter Canal and Mining Co. (incorporated.) Capital stock, \$500,000; C. C. Bowman, President; H. S. Tibbey, Secretary; C. D. Horn, Superintendent; and J. D. Wilson, General Manager. This company are constructing a canal, with a capacity of 5,000 (miners') inches of water, five feet wide on the bottom by eight feet wide on the top, and three feet deep. The water is taken from the North Fork of the Mokelumne river, 45 miles from its destina-

tion. It is being constructed particularly to obtain power to run the quartz mills in this vicinity, and is expected to be completed within three or four months hence. Some 300 men are now engaged in its construction.

The Keunedy mine is situated three-fourths of a mile N. W. of Jackson, and is owned by a joint stock company, the stock of which is all held here. P. Reichling is superintendent. This company claim 2,100 feet on the same lead as the Oneida and Amador. They have a shaft down 500 feet, on an incline of 45°. At this point the ledge will average from six to seven feet thick. Hoisting works upon the same (and very complete) are run by an engine of 25-horse power, and their 20-stamp mill is run by a steam engine of 45-horse power. They crush about 25 tons of rock daily (24 hours), which has averaged thus far \$20 per ton. Thirty-five men are regularly employed.

The Zeile mine, (formerly known as the Coney) is situated one-half mile south of Jackson, and is owned by San Francisco capitalists. This company own 800 feet of a ledge, and have developed it to a depth of 515 feet. Their hoisting works are run by a 20-horse power engine; the shaft is down on an angle of about 50°; their ledge is about 11 feet thick. They have not as yet thoroughly tested the rock in this mine, but the extensive prospecting they are doing, shows at least faith. They now are working 17 men. The rock is highly sulphuretted.

The Kearsings mill, near Jackson, is a custom mill, with four stamps and patent grinder with amalgamating pans, etc., and is owned by the Kearsing Bros. It is run by water power. They crush from eight to ten tons per day (24 hours).

The Oneida mine situated two miles north from Jackson, (and midway between there and Sutter Creek) is owned by an incorporation. A majority of the stock is held in the vicinity. J. D. Fry, of San Francisco, is President, and C. Warkins, Superintendent. The length of the claim is 3,000 feet. They have three different incline shafts down on an angle of 65°; the first is down 200 feet, the 2d 700 feet, and the 3d 800 feet. They are working only through the two latter. The ledge will average 14 feet thick, running from one inch to 20 feet. At present they are working 100 men. Their 60-stamp mill is run by an engine of 60-horse power, and crushes daily 85 tons of rock (24 hours), which averages \$10 per ton. The hoisting works are run by two engines, one of 30, and one of 15-horse power. This mill is complete with all the accompanying pans, machinery, etc., to successfully run a mill of its caliber. More from the same quarter in my next.

L. F. Mc.

Utilizing the Heat of Exhaust Steam.

[Written for the Press.]

EDS. PRESS.—My attention has been called to an item in some newspapers concerning a new method of utilizing the heat of exhaust steam from non-condensing engines which is now lost. This method consists in placing an auxiliary boiler in the smoke flue and evaporating bisulphide of carbon, which is used in a second cylinder, in a similar manner to that of the steam, after which it is condensed and pumped back into the boiler to be used over again. The exhaust steam-pipe from the steam engine is made to pass through a copper coil, which is placed in the bisulphide boiler, and thereby give up all its latent heat to the bisulphide of carbon.

Statements are made of an enormous saving in fuel over the ordinary method without this arrangement, more than 50 per cent.

An illustrated description with some data are published in the *Scientific American* of February 4th, 1871, which would give the impression to general readers and users of steam engines that there was something wonderful in the amount of fuel saved by the addition of a boiler using bisulphide of carbon in the manner stated. The statements in the *Scientific American* are substantially these: That the engine using steam raised 500 pounds 456 feet in 2 hours, while the bisulphide engine raised 500 pounds 528 feet in the same time, showing that the gain in using the waste heat in the chimney and exhaust steam to be 115 per cent.,—which is extraordinary, if we don't look any further. Let us see.

In this experiment, the amount of fuel used in getting up steam and running 2 hours was 5 pounds of wood and shavings, 6 pounds of charcoal and 12 pounds of anthracite coal; all together, 23 pounds.

Let us allow the 5 pounds of wood and

shavings, and 6 pounds of charcoal to be consumed in raising steam, and that the 12 pounds of anthracite only were used to evaporate the steam and bisulphide of carbon during the 2 hours; that would be 6 pounds of coal per hour. Now let us see how much power that 6 pounds of coal generated, or how much useful power was realized by it.

The total work done was 500 pounds raised 984 feet in 2 hours, which is equal to 4,100 pounds raised one foot high per minute. This, divided by 33,000, gives .124 or about ¼ of a horse-power, to exert which required 6 pounds of anthracite coal.

Now in this city, in the National Flour Mills, 1-horse power is obtained by about 4½ pounds of the screenings of Mt. Diablo coal, which is not nearly so efficient a steam fuel as anthracite by at least 12 per cent. And also in the Atlantic States, 1-horse power has been obtained commonly by not exceeding 4 pounds of anthracite coal. It shows that although the bisulphide engine added 115 per cent. to the work done by the steam engine, yet the total amount of work done by the coal consumed was only one-twelfth of the amount performed by ordinary first-class engines; in other words it required 48 pounds of anthracite coal per hour to produce 1-horse power.

That there may be a saving in using a bisulphide boiler and engine in connection with a steam engine and boiler, I do not deny; but until a much closer approximation of results is reached between this method and the present method without the bisulphide engine and boiler, I shall remain doubtful.

W. W. HANSCOM.

San Francisco, March 25th, 1871.

Missouri Tin Mines.

[Written for the Press.]

EDS. PRESS.—I enclose herewith a P. O. money order as subscription for the SCIENTIFIC PRESS. I receive the paper regularly and am well pleased with it; couldn't do without it, in fact.

An item in the PRESS, of March 4th, says: "Missouri has given up hopes of finding tin ore in paying quantities."

The "Tin Mining Company of Missouri" are prosecuting the work of erecting concentrating machinery and building furnaces for smelting, expecting to reduce 40 tons of ore daily. The company have one million stock, 10 per cent. paid up, and not a share for sale. Their hope of success and confidence of having "tin in paying quantities" never were better.

How is the San Jacinto Tin Company, of San Bernardino county, succeeding? Are they getting tin? I had the pleasure of assisting in running out the first bar of tin from their ore, when working in your city about two and a half years ago.

Should you desire any information about Missouri tin mining enterprises, I shall be glad to furnish it. [We should be most pleased to hear again from our correspondent on such matters.—EDS.] I am not interested except so far as I wish the cause success, it being good for the country where I reside.

C. CAVALLIN.

Fredericktown, Mo., March 20th, 1871.

Mexican Mining Words.

The following glossary may be found very convenient to many of our readers. It is sent to us by an able mining engineer who has had an extensive practical experience on our coast, and who says in a private note: "Any miner or mill man who subscribes to your paper, will be repaid many fold, by carefully reading it, in the way of keeping pace with the improvements of the day."

Un Mineral—A mining district.
Las Sierras—Mountain ranges or mountains.
El Cordón—A ridge or spur of a mountain.
El Creston—A crest or outcroppings.
La Guila—A guide or float rock.
Una Vela—A lode or ledge or true fissure vein.
Una Vela tapada—A blind ledge or lode.
El Rumbo—The course.
La Recuesta—The dip.
El Mantlo (mantada)—A flat deposit.
Vela Cata—A new vein. (See *Cata*.)
Una Vena—A Vein—a narrow seam or streak—a "razor blade."
Una Pertinencia—A claim on a lode as allowed by the Mexican Mining Ordinances. It is 200 Varas de Medir (200 yards running measure) (a vara = 33 inches.) The discoverer is allowed three claims together or apart. A Co., is allowed four claims divided into 24 shares (*Acciones*).
Las Medidas—The boundary lines of a claim as marked by *Las Escaleras*—Stakes or *Estacada*—Staked off.
Las Guardas Rayas—Monuments of wood or stone.

La Demasia or *Huaco*—Unclaimed ground between two claims.

La Boca vieja—The mouth—the old month.

Escabar—To strip up a claim on the surface merely.

El Tajo abierto—An open cut.

La Obra—The tunnel—the work.

La Lumbera—Air shaft.

El Socobon—An adit.

El Tiro general—The main shaft.

Un Pozo—A shaft or pit or winze.

Los Canones—Drifts.

Contro-pozo—A "riss" to meet a winze.

Nivel—Level.

La Cata—A small pit. A cayote hole.

El Crucero—A cross cut.

La Tabla—A stope.

El Fronton—A breast.

La Patia (pat-tee-yah)—A narrow foot-road in a mine.

Un Labor—Any portion of a mine from which ore is being extracted.

Guardas de Labor—Roof and walls of a mine in general.

Las Respaladas—The walls of a mine.

El Alto—The hanging wall.

El Abajo—The foot wall.

Contra Mina—An underground connection.

Los Caminos—The traveled roads in any mine, of all kinds.

Los Planes—The deepest workings or bottom of a mine.

Los Pilares—The pillars of a mine—in place of timbers to prevent caving in; to "dispillar" a mine is to knock down the pillars of a mine, contrary to law, and is significant of abandonment.

Un Claro—Any worked out portion of a mine.

De Cielo—Working overhead. The roof.

Barranca—A precipice.

De Pied or *a Pique*—Beneath—sinking or working down—the floor.

A Chiflon—Working down and widening out at the same time.

Los Desagues—The drains of a mine.

Presa—A dam.

Pileta—A snmp or tank.

Paradera—Sluice gates.

Charqueo interior—To lead water to a drain.

Un Tapacalle—(in a shaft) a landing or permanent staging. A gallery.

Tarango—A shifting staging of *Orcones* and *Ladones* (forked poles and rods.)

Echardero—A platform for weighing, sorting or packing ore on. A *Patio* of a mine.

El Patio—The level space at the mouth of a mine.

Las Escaleras—The ladders of a mine of notched pine poles.

Puertas—When a vein pinches—"Cap rock."

Un Quanton—A slip cutting out the ore.

Cavalo—A horse (in a mine.)

Alogar—To gonge a mine—to work narrow, to smother or choke.

Un Amparo—A permit from the Government to quit work on a mine, for any time beyond the customary four months in each year.

Derolada—Gutted, spoiled and abandoned.

Un Clavo—A chimney of ore.

Hilos—Threads of ore.

Un Ojo—A "pocket."

Cinta—A streak of ore.

Una Bonanza—A big rich strike.

Buena Saca—Doing well.

En Frutos—In ore.

En Borra (Emborrescada)—not in pay rock—pettered out, applied to the barrenness of veins—

—not dead work as in a tunnel to cut a vein.

Obra muerta—Dead work.

Fundido—Filled up with water, rock or earth.

Hundido—A settling or sinking.

Una Caida—A fall, a slide.

Chorrera—A cave, a caving in.

Suffocante—Hot air.

Vapor—Foul air.

Un Barrero—A drill hole.

Un Cohete—A blast or "shot."

El Desmonte—The rock left standing after a blast.

Cavassos—Borings.

La Tronada—The rock thrown down at a blast.

El Balo—The dump.

Terrero—A pile of waste rock.

Un Tequio—A task—each cleaners pile of metal.

Bartolina—A room cut in a mine to lock tools, ore, etc., in.

Dispacho or *Dispensa*—An ore house.

Una Adema—A set of timbers.

Ademada—Timbered.

Orcones—Forked poles.

Las Llavas (yarh-beese)—Beams, timbers.

Latones—Small poles.

Cavasal—A cross piece.

Pied derecho—A stud.

Maderas—All kinds of wood used in a mine for any purpose.

Un Malacate—A whim.

Una Manesuela, Argano, Hecho bueno—A windlass.

Calabrote—A large rope.

Una Soga—An 18-thread line of the msgruey plant. (A native rope.)

Mecati—A small line.

Cabreste—A hair rope, or line.

Un Negocio—An enterprise or business.

Destajo—A contract.

El Arroyo—A creek.

La Quebrada—A ravine.

Pedregal—Stony place.

Canada—A gulch.

Risco—A steep rock.

Encampanar—To get under a rival mine, to dig him out.

Abonar—To pay a debt in instalments.

Fueros—Special privileges.

C. B. D.

Durango, Mexico,

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SALE OF ORE.—*Chronicle*, March 25th: Birdsall & Co., of Dayton, Nevada, have purchased 200 tons of copper ore of the Leviathan Co., deliverable at the dump, for \$50 a ton. The ore is used in the manufacture of blue stone. The Leviathan is looking well.

ITEMS.—*Miner*, March 25th: The Monitor Co., on the Tarshish lode, are getting nice ore from their upper tunnel, and are now in a large body of it. The lower tunnel is also following up a good seam. The Schenectady Co., on the same lode, are taking out more and better sack ore than ever before....Grading for the additions to Monitor mill has been commenced, and the carpenters will soon be at work.

CALAVERAS COUNTY.

STRUCK GRAVEL.—*Chronicle*, March 25: Mullen & Co., who for several years have been running a tunnel to strike the Harkins lead, have reached gravel. The tunnel, which is near Worth's hill, below the Junction, is 1,100 feet in length, through solid bed-rock. We are informed that unfortunately the tunnel is 20 or 30 feet too high.

SANDERSON MINE.—Mr. Sanderson, of the quartz mine at Railroad Flat, informs us that the lead is looking remarkably well and improving in appearance. Our readers will recollect that the first crushing of rock from the shaft, near the surface, paid over \$100 per ton.

AMALGAM.—Reed & Hilliary, of West Point, brought a chunk of amalgam to town this week, from their mine. We are informed that \$1,200 were obtained from 14 tons of ore.

EL DORADO COUNTY.

DORAN.—*Placerville Democrat*, April 1st: This mine, near Irish Creek, has a well-defined ledge, four feet thick, and carries free gold with abundant sulphurets.

WHITE OAK TOWNSHIP.—Cor. of same: The Gray boys, while sinking on a quartz lead recently discovered in their inclosure, three miles north-west of Shingle Springs, struck rock at the depth of 15 feet, fabulously rich. It is apparently netted together with gold, and the clay and decomposed quartz intermixed, prospects from 10 to 75 cents to the horn. The ledge is one to three feet in thickness, rich in sulphurets, plainly defined and easily worked. Lahay & Co., working a placer claim in the same field, on Thursday found a nugget weighing 33 ounces—the piece containing not to exceed 3 ounces of rock. In addition to the lump they obtained 7 ounces in fine dust, as the result of one day's work.

INYO COUNTY.

ITEMS.—*Independent*, March 25th: The ditch at the Kearsage is completed, timbers for the tramway are nearly all out, and the machinery connected with the waterwheel is on the ground. The pans, etc., of the San Carlos mill, and of four other mills, have been purchased. The mill will start May 1st with 30 stamps....The Superintendent of the Owens Lake Silver Lead Co. has contracted for 100 tons of silver ore from a mine in the old Keyes district, owned by M. L. Clarke and others, of Bishop Creek....Between 75 and 80 tons of bullion have been shipped from the Swansea works during the past four weeks....P. Lynch and A. M. Edgington recently purchased Wm. Lee's interest in the Kearsage for \$8,400.

CERRO GORDO.—Cor. of same: On the 18th, a party consisting of P. Cassidy, T. McDonough and P. Devlin struck, on the Crowning Glory Hill, a body of ore of the width of 60 feet, and cropping out high above the surrounding ground. Assays by Mr. Senter, of the Belshaw works, resulted in 123 ounces of silver per ton, and a large per cent. of copper.

SILVER SPROUT.—On this lode a 60-foot shaft has been sunk, and a 65-foot tunnel run. Several hundred tons of ore have been extracted, eight lots of which worked from \$28 to \$734 per ton. The mines are 1,000 feet higher than the Kearsage cluster. A tunnel of 550 feet would cut through all the leads. The Co. propose to sell 2,500 shares at a reduced figure to procure a working capital.

MARIPOSA COUNTY.

TO START UP SOON.—*Gazette*, March 31: We learn that the Company will soon commence crushing rock at the Princeton mine. This mill has been idle several years.

NEVADA COUNTY.

ORLEANS.—*Gazette*, March 30th: This Co., on Gold Flat, down 210 feet, commenced hoisting rock this morning. They have their drift opened on the ledge 100 feet. The vein averages a foot in width, and the rock prospects well. Sulphurets have been tested, and yielded \$140 a ton.

PITTSBURG.—This mine has been doing handsomely for eighteen months. The mill and mine give employment to eighty men. Ten stamps are run night and day, crushing twenty-four tons of rock.

MINING REVIEW.—*Grass Valley Union*, April 1st: In the Eureka mine, the main shaft is going down for another level, and the ledge bears mineral as heavily as any part of the ledge above. The mill yields \$2,000 per day, exclusive of sulphurets. The chlorination works are now fired up on a large body of sulphurets, very rich....

The Idaho mine is running night and day with good results....The Allison Ranch has been most of the month on good rock, but lately it is not so good....The Cariboo, an overlay of the main ledge, is doing well. It is very small, but very rich. Rock is being taken out on shares by a company of miners....Perrin's mine has nearly done its dead work. The mill commenced crushing on Friday....North Star rock from 10th level is now going through the mill, and looks splendidly....South Star is developing well....The Combination Co.'s tunnel is in 200 feet....The Coe mine has flattering prospects. Improvements are making in the amalgamating machinery....Greenhorn has a 5-foot ledge north of the shaft, which shows well. On the south, not so well, as yet. The mill is running again....The custom mills of the district have been running more regularly than usual this winter....There is unusual activity in the gravel mines. Locations, and projects, and real work, make the order of the day from Alta Hill to Rough & Ready and even below....The Hope Gravel Co.'s drift northwest is in 700 feet and shows a bed of pay gravel from one foot to two feet thick. The tunnel northeast from bottom of shaft, will be completed in a week or two....Prospects of the Atlanta are encouraging. Water nearly out, and a large ledge at the bottom....Webster Co.'s sluices give out every day much more than expenses. It is estimated that the claim will pay \$20 to the hand. The Co. proposes to put up a mill to run all the dirt through....Baltic are piping into a good breast of washed gravel....Enterprise stopped to repair the engine....Town Talk puts all its gravel through the mill, and pays well.

Same of 2d says Hope Gravel west drift yesterday struck into a larger bed of gravel than yet found in that direction, rich in gold. The bed rock tunnel is also completed. The work ended with greatly improved prospects.

WASHINGTON.—*Transcript*, March 29th: Considerable prospecting is going on with fair results. Same at Rocky Bar. Also on Scotchman's Creek. The people think that these old places will be rich again, when worked with the improved appliances of the day.

NORTH BLOOMFIELD.—Same of 30th: This Co. has made another strike at Malakoff. From 20 to 75 cents to the pan. Some excitement. Lively time in town lots.

ROUGH & READY.—Same of 31st: Landes & Co., Goshen Hill, are piping with 150 feet pressure, and have rich gravel....Portuguese on Squirrel Creek are washing off tailings to work the bed in summer....McSorley & Co. have been washing but now fluming a ditch....Bagley & Co. are opening the same ridge on the south side....Jenkins & Co. realizing good wages....Reynolds & Co. are also running for the channel. They have 200 feet further to go....Topey & Co. have got into the deposit and are making \$5 per day to the man....The Baltic has made one clean up, taking out \$20 per day to the man....Webster Co. taking out \$160 to \$200 every 24 hours....The Picayune adjoining, are running for the same channel through a tunnel.

BIG SALE.—Ed. Williams and Neece & West have sold their claims in the vicinity of Little York, You Bet, and Waloupa, to the Birdseye Creek Gold Mining Co., an English corporation doing business in London. This sale includes the Chalk Bluff ditch.

Same of April 1st says Little York is lively. The new English Co. will commence work at once....Omega is turning out a large amount of money....The report throughout shows an encouraging state of affairs. Capital is seeking investment in gold mines now rather than in silver.

ON THE RIDGE.—Same of April 2d: The prospect was never better. At Birchville

the Bed Rock Tunnel is in 250 feet, and have commenced washing. The Buckeye, at Sweetland, owned by a London Company, clean up every 30 or 40 days \$25,000 or \$30,000, while their expenses are only about \$8,000....The Manzanita Co. are working off the top dirt which is paying well....The American Co. use 1,500 inches of water every ten hours. They run 10 or 12 days and clean up \$10,000 to \$15,000.

SUCKER FLAT.—The Blue Gravel Co. are putting in a diamond drill to be worked by compressed air. The tunnel is in 1,100 feet.

PLACER COUNTY.

GOOD FRIDAY.—*Stars and Stripes*, March 30th: Supt. Purdy has erected very complete hoisting works, and proposes to sink 120 feet before drifting. Everything is in good shape.

DUTCH FLAT.—Cor. of same: The ditches are running full and the mines are under full headway; but few have cleaned up yet. One company on Plug ugly Hill, after washing gravel for sixteen days, cleared up \$2,380. The same ground was claimed and worked on a small scale ten years ago.

RATTLESNAKE BAR.—Cor. of same: The water in the ditch is approaching us slowly. The eliding of the new walls makes it tedious. There are considerable preparations along the line among the miners. From here to Carrollton the ground is etaked off.

SHASTA COUNTY.

THE POTOSI.—*Courier*, April 1st: Hon. John P. Jones, who some time ago purchased this mine at Muletown, is coming up shortly to start work; and if the quartz is found at a certain depth, a mill will be erected.

SIERRA COUNTY.

READY.—*Democrat*, March 30: The American Co. at Morristown have got the water started through their ditch, but not in sufficient quantity to commence work with yet. Their claims are rigged up in splendid shape.

GIBSONVILLE.—Cor. of *Messenger*, April 1st: The Chalcedony bed rock has pitched so far away as to necessitate a horse-power whim. The Bootjack, adjoining, are in a like condition as to bed-rock, and are nearly worked out until they extend their main tunnel, and sink another incline beyond. The Union Co., have a large yard of dirt which they are now washing up. The Nip & Tuck have also a large yard of dirt out, which is expected to pay well. Up Whisky Diggings way, the Nevada Co. claim is paying finely. Dr. Porter and Co. have their claim finely fitted up, and it is prospecting well. The Wild Irish Co. in King Sayers Dominion, are pushing their bed rock tunnel, for the Pilot Peak ridge, with energy, and making fine progress. Pilot Co. 1, are making good headway. The Niagara Co. are opening their ground through the old Vermont tunnel. North American claims have out an extensive yard of gravel, which is expected to wash up largely.

SISKIYOU COUNTY.

ITEMS.—*Yreka Union*, March 26th: Messrs. Edgerton, Spaulding and Bloomer are prospecting on a creek in the Siskiyou Mountains, two or three miles north-west of Cole's. They have found some gold with favorable indications. There is ground for plenty more prospectors, and water is abundant....Moses & Co. are running their quartz mill on Humbug.

TRINITY COUNTY.

ITEMS.—*Journal*, April 1st: At Douglass City, every body is at work. Mason, Marshall & Co. have their bed-rock tunnel in one hundred and fifty feet....Mr. Silcox is crushing quartz at his mill on Indian Creek, and anticipates a good yield....The weather is lovely; miners all at work: no more growling.

Nevada.

COPE DISTRICT.

INDEPENDENCE VALLEY.—*Elko Independent*, April 1st: Mr. J. F. Ford, who showed us rich ore from Independence, gave us the assays of four parcels, as follows: \$307.88; \$118.75; \$15.71; \$120.41. This ore was from Grand Junction district, 20 miles this side of Bull Run.

RECH.—The Independent mine at Mountain City, is improving. The ledge, now three feet, wide, has been drifted on forty feet, and is producing ore worth over \$3,000 per ton.

The Blue Jacket mine, at Bull Run, is being worked successfully. The company has packed its ore to Mountain City for reduction the past winter. After being exempt \$40 per ton for expenses of working, it has paid to the Assessor \$75 for assessment on ore the past three months.

MOUNTAIN CITY.—Among the mines worked at the present time, the El Dorado has a lode five feet in width; Pride of the

West, a ledge four feet wide, and 100 tons of good assorted ore on dump; Little Giant, a two-foot ledge; Monitor, 40 tons of ore on dump; and the Idaho, with 75 tons out.

ELY DISTRICT.

MORE STAMPS.—*Record*, March 26th: Ten additional stamps for the Raymond & Ely Co.'s mill, arrived on Friday.

BULLION IN TWO DAYS.—Same of 30th: Wells, Fargo & Co. shipped, on the 27th inst., via Hamilton, six bars of bullion, from Ph. Felsenthal to San Francisco, valued at \$5,203.06; also, via Salt Lake, seven bars, from the Meadow Valley Co., to New York, \$10,061.31; also, via Salt Lake, nine bars from the Raymond & Ely Co. to New York, \$15,630.32. On the 29th they shipped, via Hamilton, one bar, from B. F. Sides to San Francisco, \$1,392.53; also, via Salt Lake, seven bars, from the Meadow Valley Co. to New York, \$10,315.12; also, via Salt Lake, three bars, from B. W. Field, to New York, \$5,688.82. Total, \$48,381.16.

RICH STRIKE.—We were on Tuesday, shown some fine looking rock from a new mine in Highland district. The rock assays \$100 to \$400 per ton. The ledge is over two feet wide and is known as the Nevada Champion.

FREIBERG DISTRICT.—The Shonte has a large vein of ore at a depth of 900 feet. Workmen had cross-cut seven feet into the vein without reaching the wall. The ore thence is worth \$300 to \$500 per ton. The Morning Star has a supposed average width of 10 feet. A sale of the mine for a large figure is contemplated—two parties being anxious to purchase.

HUMBOLDT.

GALENA DISTRICT.—*Register*, April 1st: The White mine is taking out ore daily, worth \$375 per ton in San Francisco....The Cosmopolitan assays on an average, \$180 per ton. The Butte, lately purchased by a San Francisco company, commenced grading for a 20-stamp mill March 27th. The Boyer boys have struck what is supposed to be the 1st north extension of the Butte. It is two feet in width. The Leidlolph ledge is two feet wide, and worth \$250 per ton.

SHEBA MINE.—*Silver State*, April 1st: Star City has been again vitalized by the recent developments in the Sheba. Old property holders are looking up old titles and erecting landmarks. Some thousands of tons of ore have accumulated during the winter, the concentrating mill having been idle for want of water.

ARIZONA MINE.—We visited this the other day, and followed in the tunnel the 3½-foot ledge 1,200 feet. The ore is chiefly milling ore worth \$75 per ton; but there is a large quantity worth \$3,000 per ton. Whole cost of working, \$7.50. The richest is sacked and shipped.

ITEMS.—The Hope Co. are putting up machinery, and will be ready about the 15th, to work custom rock....Sam King has sold his mine in Central district, for \$20,000.

RESE RIVER.

MONTHLY BULLION SHIPMENT.—*Reveille*, April 1st: There were shipped through Wells, Fargo & Co. during March, to New York by the Manhattan Co. 90 bars of bullion, weighing 10,342 pounds, and of the value of \$125,943.46; and to San Francisco by John A. Paxton & Co., 45 bars, weighing 3,669 pounds, of the value of \$34,288.68—the latter almost entirely the product of the Canfield mill at Belmont. Total, 135 bars, weighing 12,009 pounds, valued at \$160,232.14.

Arizona.

BRADSHAW.—*Prescott Miner*, March 25: Tests made this week, at one of the mills near Prescott, by the Supt., who has worked in several mills at Gold Hill and White Pine, Nevada, are conclusive as to the great richness of the Tiger ore. One piece yielded at the rate of \$2,500 to the ton, and the general average, of all the rock in the ledge, gave between \$600 and \$700 per ton. A test of rock from the big croppings gave from \$50 to \$75 per ton, and when we say that said croppings are 30 feet thick, people can form some idea of this "Bank." Work upon the gold mines was also progressing. The shaft of the Del Pasco was down about 80 feet, and the ore was as rich as ever. The placer miners were making fair wages.

WALKER DISTRICT.—Mr. Shelton is working Vernon ore, and Mr. Pointer, Pointer ore. Both are making money, as every ton of rock is good for \$100 to \$1,000. Mr. Fessel had taken some exceedingly rich rock out of the Victor lode. The Thunderbolt mill will start, next week, on ore from the Davis lode, Hassayampa district. The placer mines have all been doing well. Two men, in two days, took out, with a rocker, \$47.

MORAVE COUNTY.—Some months since, the old Sacramento district was re-organized as the Wallapai; and ore sent to San Francisco gave from \$25 to \$58 per ton. Some miners have undertaken to erect a smelting furnace. Bullion can be carried 24 miles to the Colorado River, and shipped per steamer to San Francisco at a total cost of \$40 per ton. And it is worth \$150 to \$200 per ton.

Colorado.

CARIBOU.—Register, March 29th: The mine never appeared so well as now. It has been a long time since any such magnificent silver ore met our eye, as the lot just sent to us from the Caribou by B. O. Cutter. We are assured that it is but a sample of thousands of tons, already in sight. We fully believe this mine will eclipse anything ever opened in Colorado.

NEVADA DISTRICT.—Whitcomb's mill is kept employed upon ore from the Rising Sun, Indiana and California lodes, running as a regular thing from eight to ten ounces per cord. Martin Lewis is refitting the Gilpin mill. George Wells has taken the Rocky Mountain mill at Mountain city. The Smith & Parmelee mill, under charge of Cochran & Fitzsimmons, is running upon Gregory Second and Fisk ore. The former runs seven to eight ounces per cord, and the latter six. Jack Williams has leased the Kip & Buell mine.

GOLD BULLION.—The gold shipments by the Banks this week foot up to \$20,000 in currency, making a total of \$60,000 for the month thus far.

NATIONAL CO'S MILL.—Herald, March 25: This fine mill in Nevada District has been thoroughly fitted up by the Church Bros. and James Hitchens, and is running to its full capacity on rich ores from Kansas and Burrough lodes. It has 25 stamps, each weighing 800 pounds, with battery and copper-plate amalgamation. In front of each copper table are two boulders, six feet long by two wide; here the tailings from the batteries are partially concentrated. These concentrations are then treated in eighteen (four foot) iron pans.

MOUNTAIN CITY.—The Gregory Second lode, is being worked more extensively than for years. J. H. Johns & Co. have commenced work on two claims in and south of the gulch. Taylor & Co. on the two claims north have fine prospects. Above these on the hill five claims are worked. Three claims are worked in the Fiske lode.

GRAND ISLAND.—The Trojan lode is still yielding rich ore. Eight or ten tons of first-class quartz, worth four or five hundred dollars per ton, are being shipped to Hill, together with a quantity of second class ore, on which a profit will be derived over all expenses. The shaft is down 85 feet.

KANSAS LODE.—The line presents unusual activity. Eleven claims are worked on the Kansas, and five on the Jones & Matteson, its eastern continuation.

GEORGETOWN.—Miner, March 30th: Seven hundred feet below the surface of the earth the Burleigh tunnel, 935 feet in length, has cut a noble true fissure vein, 15 feet in breadth, incased between walls of primitive rock. The vein matter is composed of feldspar, quartz, argentiferous galena, blende and iron pyrites. The breadth of the mineral deposit in the whole vein is about four feet. The highest assay yet obtained is 72 ounces in silver, and 60 per cent. lead. By measurements lately made we are authorized to state that the vein cut is not the Mendota. The beneficial influence that this strike will exert on the mining industry of Colorado, no one can estimate. * * We can safely say that Mr. Burleigh and the friends who have stood by him financially, are the owners of one of the richest inheritances for themselves and their posterity that ever mortal man owned.

Montana.

THE PROSPECT.—New North West, March 24th: That we are to have a good mining season in 1871 is believed by all. The snow-fall is, on the average, the best we have had in years; the ground is in better condition from the fall rains; there are increased facilities for reservoiring and carrying water on the mines; the extent of developed paying mines, in this country, is greater than last year, and no diversion, like that of the Cedar stampede last year, existing this winter, the miners have remained in camp and are preparing to commence in full strength with the first flow of water.

SILVER BOW.—Cor. of same: There are four ditches to carry water on to mining ground in Silver Bow and Rocker. Divide Creek Ditch, capacity 500 inches. Basin Ditch, 450 inches. McMinnville Ditch, 700 inches. Robinson & Turner Ditch, 400 inches. The water in the McMinnville

will be sold very low this season, which will enable plenty of ground to be worked. There will be 15 white companies at work in dry diggings, owning from 1,000 to 4,000 feet of ground. There will be three hydraulic claims worked. Perhaps in all there will be 300 or 400 men employed. The average pay of ground per hand will be from \$6 to \$16 per day. There will also be five miles of the creek worked, which will pay well.

PRAIRIE GULCH.—Cor. of same: There are 12 gulches and 10 bars located in this district. All prospect well. Miners think they will pay \$10 to \$20 per day, at 25 cents per inch for water. There are 500 claims recorded. The area of ground—hills, bars and gulches—that has been prospected and panned out well, is 6 miles square. There are more than 100 miners in camp, and men coming in daily. Harry Adams and George Wessol made a discovery last week, which they named Pilgrim Bar. It prospects 10 cents to the pan. In the vicinity is Leslie Bar, discovered by "Silver Bow Jimmie." He says it prospects 20 cents to the pan. Twenty claims are located on it, and a large extent is open yet. The snow is four feet deep on the level in Uncle Ben's Gulch. Up on the mountains it is seven to ten feet. We expect water in the Miner's Ditch by April 15th.

QUARTZ CREEK.—Cor. of Missoula Pioneer, March 23d: On 17, below the upper discovery, two men, this week, made big wages for four, without counting nuggets, one of which weighed over \$30. There is not a claim in the upper district, thus far, on which bed-rock has been struck, where gold in encouraging prospects has not been found. From the mouth of the creek to No. 6 above discovery, in the lower district, the claims are nearly worked out, and Celestial John has found a footing on 2, 3, 4 and 5. Nos. 6, 7, 8, 9 and 10, in the lower district, have 4,000 feet of lumber sawed, besides rille-blocks in quantities, and will work their ground through a bed-rock flume, using the whole volume of the creek's water. Their pay-streak is 40 feet wide, and yields an average of \$4.50 per day to the man, shoveling into the sluices. The Upper Discovery Co. is running a blind drain to Discovery Claim, and this week averaged \$10 to the set of timbers.

BROWN'S GULCH.—Montanian, March 23: We learn that the new mill in Brown's gulch, erected by Mr. How, will be in running trim in a few weeks, and will make its first run on ore from Hon. Chukky Johnson's Pacific lode.

GRANITE GULCH.—The mills will soon break the monotony of the valley by a run. Mr. Gornley's mill, which is fitted up to run by steam or water power, will commence this week.

ROCKER CITY.—We have been shown a specimen from the Rocker lode, owned by H. A. Gross, opposite Rocker City, which shows free gold in abundance. They are down 85 feet, with a five-foot vein, which is rich.

Oregon.

BOHEMIA.—Jacksonville Sentinel, March 25th: These ledges, on the line between Douglass and Lane counties, 65 miles from Roseburg, were discovered some years since, but the reports were too good, and failed to obtain credence. We see from some of our exchanges, however, that a five-stamp quartz mill has been landed at Eugene City, with the machinery complete, for the Bohemia quartz mines, by Mr. Joseph Knott, of Portland.

Utah.

THE EMMA.—A correspondent of the Colorado Miner, March 16th, writes that the rich ore of this mine is in a "pocket," 28 feet wide and of unknown length. Nineteen-tenths of everything taken out between the walls is sacked for shipment, and is said to be worth \$200 per ton, in lead and silver. About fifty tons is sent daily westward. This will be increased when the roads become good, for there is a large quantity on hand, sacked. The shaft is 180 feet deep. The Flagstaff lode, 500 feet north, has a shaft 200 feet deep, with ore continuous from the surface, varying in width from 8 inches to 6 feet. Five tons worth \$75 per ton, shipped daily.

MONTZUMA.—Salt Lake Tribune, March 18th: Ore was struck a few feet from the surface and has been continuous. The drift extends 265 feet, at which distance the vein opens out in width to an extent that indicates a solid mass of mineral. Being on the same hill, and in the immediate vicinity of the Emma, it is fair to presume that it may prove itself second to it only in extent and value.

Mining Stock Market.

[S. F. Stock and Exchange Board.]

SAN FRANCISCO, Thursday Eve., April 6.

The stock market has continued excited and active during the week, but has been quite irregular. Amador has sold for \$345 to \$350. Crown Point has maintained its position, and even advanced, on Wednesday reaching as high as \$170, which is \$10 better than before (on the 20th ult.).

During March, dividends were disbursed by the following incorporations:

Black Diamond Coal Co., \$25,000; Union Pacific Salt Co., \$2,250; Natoma Water & M. Co., \$3,000; Chollar-Potosi Mining Co., \$280,000; Eureka (Cal.) Mining Co., \$40,000; Eureka Cons. Mining Co., \$37,500; Golden Chariot, (Idaho) M. Co., \$70,000; Hale & Norcross Mining Co., \$40,000; North Star (Cal.) Mining Co., \$9,000; Raymond & Ely Mining Co., \$30,000; Yellow Jacket Mining Co., \$48,000. Total, \$584,750. In 1870, \$144,000; in 1869, \$287,500.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

MULLER'S BRAZILIAN

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING MARCH 21st.

COMBINED ORE CRUSHER AND AMALGAMATOR.—Lyman Griswold, Denver, Colorado Territory.
LUBRICATOR.—Tapping Reeves, Little River, Cal.
ADVERTISING LAMP.—Emil Boesch, San Francisco, Cal.
ANKLE BRACE.—Jacob S. Niswander, Oakland, Cal.
HYDRAULIC NOZZLE.—Henry Shaw, Nevada City, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

IMPROVED WAGON AXLE.—C. R. Donner, Sonora, Cal. An illustration with description of this useful invention was given in the Press of March 18th, 1871.

IMPROVED MOP-HOLDER.—J. Brizee, Alvarado, Cal. This invention relates to an improved mop-holder, which is simple and cheap. It consists in employing strong wires or rods, which are arranged in a manner at once simple, easily of adjustment and durable, and which hold the mop securely to the handle. Housekeepers will find it well worth the trouble to examine the device.

MACHINE FOR MAKING HOOKS AND EYES.—J. T. Ford, S. F. Mr. Ford has succeeded in inventing a valuable machine for making hooks and eyes for toilet use directly from the reeled wire, one of each kind being made at each revolution of the driving wheel and completed ready for use. The mechanism is all driven from one shaft, and is remarkably simple and effective. Without illustrations, a description could hardly be made intelligible. Suffice it to say that the machine has been on exhibition at the Mechanics' Institute Exhibition and has attracted very considerable attention by its simplicity and rapidity. Large offers, we understand, have been made the inventor for his patent right. This is the only machine ever patented in this country for making both hooks and eyes.

SPRING FOR VEHICLES.—J. R. Hiller, Woodland, Cal. This is an improvement on a former patent granted to Mr. Hiller, and relates to an improved system of wooden springs for carriages and light wagons, by which an easy vertical or rocking motion is communicated to the carriage body. By this arrangement, the body is connected at all points directly with the frame work of the carriage, and the strain is received equally by all the springs. The same easy motion obtained by the use of the former device of Mr. Hiller, is here secured by a simpler arrangement of the springs, while the body is more firmly braced but still capable of yielding in either direction with equal facility. Both devices are excellent examples of practical inventive talent.

IMPROVED DOOR CLAMP.—H. O. Hooper, Diamond Springs, El Dorado County, Cal. This invention consists in so forming the movable side pieces of the clamps which hold a door, and their operating screws and gears, that these side pieces will be moved equally at the top and the bottom and will not necessitate an extension of those pieces down through the floor. It is a modification of a former invention of Mr. Hooper's, which was patented in July, 1869. The present arrangement ensures a perfectly parallel movement of the clamps so that they will always stand vertical, whether widely separated or near together, and will thus hold the door more securely. A simplification of the device is also effected.

To Miners and Farmers.

The following letter from the Commissioner of the Land Office to Hon. A. A. Sargent, contains instructions which will enable miners and farmers to adjust their boundaries and treat what is left of forty-acre tracts as enterable as agricultural lands. It is very convenient to both miners and farmers:

I have the honor to acknowledge the receipt of your letter of the 7th inst., inclosing one dated at Nevada, California, the 25th ultimo, from H. S. Bradley, in relation to mineral affidavits, and with reference to the subject would state that, prior to the passage of the amendatory mining act of July 9th, 1870, the local land officers were instructed that when lands were surveyed and parties sought to establish their mineral character, the affidavits alleging particular tracts to be more valuable for mining than for agricultural purposes, should be made to apply to the *smallest legal subdivisions*, which at that time were forty-acre tracts.

Since the passage of said act of July 9th, 1870, authorizing at the expense of claimants the subdivisions of forty-into ten-acre tracts, the latter are recognized as the *smallest legal subdivisions* in mineral regions, where parties have caused such subdivisions to be made agreeably to the law and instructions. And no reason is perceived why the same proof of mineral or non-mineral character should not be made to apply to each one of the ten-acre lots in a forty, that has hitherto been applicable to the forty-acre tract itself, there being doubtless many forty-acre tracts in mining districts of which a part may be valuable for mining, and the remainder clearly agricultural, or containing deposits of mineral in such limited quantities as not to be remunerative to the miner, and which it is the policy of the Government to dispose of to permanent settlers under the homestead or preemption laws, instead of leaving them to remain out of the market indefinitely, by reason of their contiguity to lands containing mines.

It is contemplated to instruct the local officers to that effect at an early date.

The letter of Bradley is herewith returned. Very respectfully, your obedient servant.

WILLIS DRUMMOND, Commissioner.
March 20th, 1871.

Bay District Horticultural Society.

This society held a special meeting last Saturday. It will hereafter hold meetings, open to the public, on the second Saturday of each month, at No. 622 Clay street.

Arrangements have been completed by which the Society will be enabled to give a horticultural exhibition in August next. The Society has negotiated with the Mechanics' Institute, to build a wing to the main building of the Pavilion, forty-five feet wide and 300 feet long, on Geary street, which is to be under control of the Horticultural Society, and is to be connected by three long passage-ways with the main building. This exhibition will comprise plants, flowers, fruits, vegetables, seeds, etc.

The premium list is already completed, and prizes to the amount of six hundred dollars will be offered. It is proposed to introduce some new features in this exhibition, and to make it surpass anything of the kind ever given here. The office of the Secretary is at No. 418 Kearny street. Applications must be made to the Secretary for space in the Horticultural Exhibition. The rules and regulations, together with the premium list will be ready in a short time.

An Unknown World.

When Bret Harte left this coast for the East, some fears were expressed as to the continued excellence of the *Overland Monthly*, of which he had been editor. That by his departure a loss was sustained, no reasonably-minded man can deny, but that the loss was irreparable, is not for a moment to be supposed. The conductors of the magazine have been stirred up to still greater exertions, and the talent of the coast has responded. The *Overland Monthly* sustains well its acquired position.

The April number is not a whit inferior to its predecessors. Freshness and talent, energy and dash, carefulness and accuracy are visible on every page, and the journal still maintains for us its wonted charms. That the public are of this opinion, is shown by the circulation which has increased largely. The young Pacific coast has vigorous talent and, we believe, will be able to supply the older Atlantic coast with other excellent writers besides Mr. Harte. It is a little queer, though, that the younger should be able to supply the older community with this article.

From the *Overland* for this month we clip the following:

How little is really known about the Island World of the Pacific! Who has ever numbered or named these little rims, with a circle of coral and a fringe of cocoanut-trees, rising out of the ocean? An article in this number is devoted to the description of one of these islands (Upolu), of which few ever heard. There is a wilderness of islands unclaimed. Now and then some adventurer tells us strange stories of people who live in these enchanted isles, and know how to roast a pig, and can do a White Man to a turn if he is not too tough, in a way to confound our notions of civilization. Skippers who have committed barratry, fugitives, pirates, and rovers thread these intricate channels, but the story of their going and coming is not known; in fact, many of them, to the great comfort of former friends, never come back to tell the story. But what a field for exploration and discovery! A six-months' cruise in a staunch yacht would be fruitful of strange adventures. There are islands just coming to the surface; others which in some great convulsion have been forced to "duck under," with no prospect of coming up all right in our times. Some there are, thank heaven, where the diabolism of Dr. Faust is not known, and where the revenue tax is honestly paid, in shells, at par value. The Empire of the Sea will one day be organized from a thousand islands, which, as yet, have not so much as a name.

A Great University.

The magazines of the United States are of comparatively recent growth. Twenty years ago we had none,—nothing but a few quarterlies of heavy digestion and two or three monthlies of trash. But thirteen years ago the *Atlantic Monthly* was born in a favored soil, and its wondrous growth resulted in such a success, that it caused the foundation of other like periodicals, many of great merit but none excelling the parent bush. The *Atlantic* is now of a ripe age, and is the standard by which to compare and judge other magazines. Many of its old contributors, writers of world-wide fame, still continue to enrich its pages, while it attracts to it the promising young talent which is of more recent growth. Its pages are fragrant, rich and fresh, retaining all the excellencies for which it has been noted, and containing others new and modern. In the April number, just received, we find a toothsome repast, and we pick out a few crumbs from a dish which is of interest to our coast now that we are working on the University question.

The University at Berlin counts its students by thousands, its professors by hundreds. There is no branch of human knowledge without its teacher. One can study Egyptian hieroglyphics or the Assyrian arrow-head inscriptions. A new pimple can hardly break out on the blotched face of the moon, without a lecture from a professor next day to explain the theory of its development. The poor earthquakes are hardly left to shake in peace an out-of-the-way strip of South American coast or Calabrian plain, but a German professor violates their privacy, undertakes to see whence they come and whither they go, and even tries to predict when they will go to shaking again. The vast building of the University stands opposite the palace of the king. Large as it is, its halls are crowded at the end of every hour by the thousand or two of young men, who presently disappear within the lecture-rooms. Here in past years have been Hegel and Fichte, the brothers Grimm, the brothers Humboldt, Niebuhr, and Carl Ritter. Here now are Lepsius and Curtius, Virchow and Hoffman, Ranke and Mommsen,—the

world's first scholars in the past and present. The student selects his lecturers, then goes day by day through the semesters to the plain lecture-rooms, taking notes diligently at benches which have been whittled well by his predecessors, and where he too most likely will carve his own autograph and perhaps the name of the dear girl he adores,—for Yankee boys have no monopoly of the jack-knife. * * * To crown all, the schools and University at Berlin are magnificently supplemented in the great Museum, a vast collection where one may study the rise and progress of civilization in every race of past ages that has had a history, and the present condition of perhaps every people, civilized or wild, under the sun.

The New Geyser Field of Montana.

According to the Eastern papers, Hon. N. P. Langford has been lecturing on a trip from Helena and along the Yellowstone river, in Montana, to Yellowstone Lake Wyoming. He thus described a remarkable volcanic district:

Judge, then, of our astonishment, on entering the basin of the Madison, at seeing just before us an immense body of sparkling water projected suddenly and with terrific force into the air to the height of 125 feet. We had found a real geyser. In the valley before us were 1,000 hot springs of various sizes, and 500 craters throwing out vapor. The geysers were seen in action in every direction, projecting water to various heights. The one first referred to was throwing from an irregular crevice, about 7 by 3 feet, a column of water of corresponding dimensions to a height of 125 feet. Various names were given to the geysers. One was called the "Fan," as it threw up to a height of 60 feet two radiating sheets of water, resembling a feather fan. Forty feet from this geyser is a vent, connected with it, and two feet in diameter, which during the eruption, expels, with loud reports, dense masses of vapor. One of the party crawled into "The Grotto" from curiosity, not supposing it to be a live geyser, and as he emerged, he was followed by an eruption of boiling water, which, if it had overtaken him, would have cooked him. "The Giant" is a rugged deposit, presenting in form a miniature model of the Coliseum. It has an opening six feet in diameter. A remarkable peculiarity of this geyser is the duration of its discharges, which continued for three hours in a steady stream five feet in diameter and 145 feet high. Opposite our camp was a symmetrical cone, like a bee-hive, about five feet at the base, and with an orifice at the top of 24 by 36 inches. We had not suspected it to be a geyser, till one morning there suddenly shot up from it a column of water which was found, by triangulation, to be 219 feet high. "The Giantess" throws up a column six inches in diameter to a height of 250 feet. This was the highest of all. The rays of the sun falling upon the geysers in action produced an infinite variety of prismatic hues, like broken up rainbows.

The explorers were much impressed by the beauty and grandeur of the valley of the Yellowstone river, and found cañons rivaling those of the Colorado. They proceeded directly up the valley, encountering many wonders on the way, such as immense waterfalls, columns of pillar basalt, like the "Giant's Causeway," and hot, and cold and sulphur springs, until in a few days they reached a summit from which they obtained a view of Yellowstone Lake, and to visit it left the well defined Indian trail and passed through a region never before traversed by civilized men.

The Yellowstone Lake was reached 12 miles beyond the mud volcano, and many days were spent in exploring the country in its vicinity. The lake was ascertained to be 8,330 feet above the level of the sea. It is an expansion of the river, and is about 25 miles long by 15 wide. It abounds in speckled trout of the finest quality, and vast flocks of geese, ducks, swans, and pelicans resort to it. It is surrounded by stupendous mountain ranges, which are approached on all sides by undulating plains and grassy foot-hills. Forests of pine touch its banks at intervals, and its beautiful margin presents every variety of sand and pebbly beach, glittering with crystals, carnelian and chalcedony. Indians rarely approach it on account of the superstition inspired by the volcanic forces of the vicinity.

DURING the siege of Paris, fifty-four balloons have carried two million five hundred thousand letters—a weight of some twenty-two thousand pounds.

HOME INDUSTRY.

Our Sugar Supply.

EDITORS PRESS:—The consumers of sugars in California and the country to the east of the Sierras, deriving their supply through the port of San Francisco alone, pay for this one agricultural product over \$6,750,000 annually. It is therefore of immense importance to know how much of this enormous consumption can be supplied from the industry of our own people.

When the late Geo. Gordon was largely interested in the refining of crude sugars obtained from Central and South America and the Pacific Islands, it became with him a question of great interest as to whether the enormous sums of gold annually paid for foreign raw sugars, could not to some considerable extent be kept at home.

He was a man of comprehensive views, and of great and good judgment, and as his thoughts naturally turned to the consideration of the great sources of sugar supply, he could not but observe that the manufacture of sugar from beets was rapidly gaining in importance in many of the countries of Europe.

This led him to think that perhaps California, able to compete with any country on earth in vegetable productions might also produce her own sugars. His thoughts, study and observations on the subject finally took form and bearing in several articles in which he expressed his firm belief that California could profitably make her own raw sugar from beets.

Designing, however, to make the thing perfectly clear to his own mind, he made a trip to Europe, largely with the view of comprehending the whole subject of its adaptability to a grand industry for California. And what was the result? He found that the manufacture of beet sugar was not only largely on the increase in European countries, but that it was actually driving the foreign or cane sugars from all their markets, in a direct competition in the matter of cost; that raw beet sugar was actually produced at a less cost than cane sugar could be made and delivered there.

Thus far then, all was well, very well; for he saw in prospect cheaper raw sugars for his own refineries, than could possibly be obtained from foreign ports, and also the certain introduction of a new and immensely important industry amongst us.

Evidence of Success at Alvarado.

But what other fact came under his observation while pursuing his investigations? Simply this, that to work a beet sugary successfully and profitably, it should have a capacity for working at least twenty tons of beets per day; and then, that every beet sugary capable of working that quantity of beets per day, was also its own refinery, and a refinery that could be employed upon other raw sugars from cane or beets.

Here was something that put a new phase upon the whole subject of beet sugar manufacture in California. If small beet sugaries working twenty tons of beets a day can supply the country with raw sugars, and every sugary do its own refining, what was to become of the large capital now invested in the San Francisco refineries?

This was certainly an important question to those most interested, and to my mind fully accounts for all the opposition to the beet sugar industry.

Every Sugary its own Refinery.

The Alvarado beet sugar company has been operating upon beets grown on some two hundred acres of land, for the last three months. None but those immediately interested are posted as to the actual profit that has attended the first working campaign of this company, and for a very sensible reason. If the business is to prove a success, the company want more than their original two hundred acres of land. If it is to result in loss, they want no more land. And what appears to be the fact? why simply this, that they have just now purchased two hundred additional acres of land at two hundred dollars per acre. This does not look much like a failure to make sugar profitably. And if they can do well with land at two hundred dol-

lars per acre, what may not others do, who land need not exceed twenty-five dollars per acre?

In proof of my other position that a beet sugary is also a refinery, we see the Alvarado company already in the market for the purchase of raw cane sugars for refining processes.

That this company can successfully compete with the large and costly refineries of San Francisco in the refining of low grade sugars, there is no possible doubt; for what can be and is done in all the beet sugar countries in Europe, can be done here.

With this view of the situation, are not the objects and purposes of those who are opposing the introduction of beet sugar manufacture along the whole extent of our great valleys, perfectly transparent.

Sugar from Melons.

The following is a correct translation from the most recent work in the French language, on the production of sugar from beets, melons, etc.:

The author says: "I have been experimenting on the juices of two varieties of melons, the most noted for their richness in sugar, and find in them a density equal to 9° Baumé, beet juice seldom exceeding 8° Baumé. It produces free, detached crystals, dry, and of excellent flavor.

"I have devoted to this subject a series of experiments on an extended scale, and from them have derived excellent results. The idea of making sugar and alcohol from melons is no new thing. As early as 1837, an enterprising Hungarian, M. Hoffman, obtained from the melon a notable quantity of juice, which he manufactured so perfectly as to be fit for immediate use, without submitting it to the operations of the refinery.

"According to that observer, melons gave as much sugar as beets in that locality; they gave double the yield from a given area of land; they grow willingly in all soils; the fruit produces a considerable quantity of seed, which yields 16 per cent. of good table oil. The manufacture commences in July and is finished in January. The juice is very easy to extract, and is equal to eighty-two per cent. of the weight of the fruit; it keeps better than the juice or pulp of beets, and is more easily worked.

"A member of the Industrial Society of Hanover, M. F. Marquardt, duly appreciated at that time the efforts and method of M. Hoffman, by saying that a Hungarian manufacturer, M. Hoffman, is occupied advantageously in the extraction of sugar from melons. That the plant is cultivated in great abundance in the locality which he inhabits—Zombor—as well as in other countries; that every arid spot, every place in the garden, in the fields and forests, useful for no other purpose, can be utilized for the culture of melons.

"The seed does not require to be planted in ground wholly plowed, or in very rich soil, nor with any particular care, and yet the fruit is produced in the greatest abundance.

"The culture demands but little work or care; the growth of the plant is vigorous, with but a small quantity of manure, even upon old, worn out land.

"An inventor of machinery adapted to the manufacture of sugar from melons, has just obtained a patent for his establishment, a large melon sugary in Hungary. Numerous specimens of sugars from this establishment have been from time to time, during the last three years, brought under the notice of the National Industrial Society of Hungary, and the following are the observations and records of that society in regard to that establishment and its products.

"The brown sugar is but a very little colored, and has a better flavor than the brown sugar from beets. The refined sugar is a clear white, and has a flavor perfectly pure and sweet. It has a fine and beautiful grain; in a word, equal to the best refined sugar from the sugar-cane.

"The melon contains sugar in larger quantities than the beet. By the use of a simple screw press, there is obtained easily six per cent. of sugar, and by employing the hydraulic press, more than seven per cent. In Bohemia, the same area of land, of the same quality, produces 450 quintaux of melons to 200 of beets; and whilst the production of seed in the former requires neither extra labor nor land, the seed from beets requires both.

"Twenty-five pounds of melon seeds will easily yield four pounds of very agreeable table oil, equal to olive, and the oil obtained from the annual crop of seeds, after reserving sufficient for the next year's seedling, will pay half the cost of culture of the entire crop.

"The manipulations in the manufacture of melon sugar are much more simple than in the manufacture from beets. The melon juice does not require the same care and rapid working, for the rasped pulp can rest for six days, and the expressed juice for three weeks, without danger from fermentation or injury to the sugar; but little or no scum rises in boiling, and it is much less liable to burn than the juice of beets.

"The pulp and seed residuo after extracting the oil, is very nutritive and very healthy for animals.

"The syrup and the brown sugars have a slight but very agreeable taste of melon, and is perfectly acceptable for direct consumption, which cannot be said of beet syrup, on account of its disagreeably bitter, herbaeous flavor.

"Do therefore," says the author, "especially recommend to agriculturists the production of sugar from melons, as an industry entirely within the scope of their ability; at the same time that it yields a larger profit than is derived from any other agricultural product from the same area of ground at the same cost."

The foregoing I offer in evidence of the practicability of sugar making from melons.

W. W.

GOOD HEALTH.

How to Prevent Spring Sickness.

Dr. Wood, in the *Herald of Health* for April, gives the reason why so many people are subject to a "bilious attack" every spring, and points out how the trouble may be avoided. This periodical complaint is usually termed "spring sickness." We condense from the Doctor's remarks as follows:

There is no more need of people being sick in the spring than at any other time of the year. This periodical sickness may easily be avoided by a little attention to diet.

During the winter people eat larger quantities of carbonaceous food, such as fat meat, butter, bread, etc.—the system naturally craving such diet more than during the summer, to keep up the animal heat against the greater cold of winter. As a general thing, more is eaten than is necessary, and as a consequence, the system is clogged up, and the excretory organs, particularly the liver, is overburdened in vain efforts to get rid of it. Those who lead sedentary lives, and get but little outdoor exercise, generally suffer most.

This difficulty is greatly heightened in the case of persons who continue this kind of diet late into the spring, after the system stands less in need of it.

Now to prevent this suffering, a person should eat a smaller portion of the food mentioned, substituting instead, an increased quantity of vegetables and acid fruits. To this end persons of sedentary habits, especially, should eat freely of canned fruits, when the natural fruit was unobtainable. [Such fruits we may add should be put up in their own juice, exclusively, not a particle of sugar should be added in the process of canning; if sugar must be eaten with them at all, it is better to sprinkle it over the fruit at the time of eating.]

There is perhaps no one thing better calculated to prevent "spring sickness" than a free use during the winter, and especially as spring approaches, of tart apples, eaten in any manner, cooked or raw—provided they are eaten as a part of the regular meals, and not between while.

HOW TO GIVE CHILDREN AN APPETITE.—Give children an abundance of out-door exercise, fun and frolic; make them regular in their habits, and feed them only upon plain, nourishing food, and they will seldom, if ever, complain of a lack of appetite. But keep them overtaken in school, confined closely to the house the rest of the time, frowning down every attempt at play; feed them upon rich or high seasoned food, candies, nuts, etc., allow them to eat between meals and late in the evening, and you need not expect them to have good

appetites. On the contrary, you may expect they will be pale, weak and sickly.

Don't cram them with food when they don't want, or have no appetite for it—such a course is slow murder. If they have no appetites, encourage, and if need be, command them to take exercise in the open air. Don't allow them to study too much, and especially keep them from reading the exciting light literature which so much abounds in our book stores and circulating libraries. In addition to securing exercise for the children as above, change their diet somewhat; especially if they have been eating fine flour, change to coarse or Graham flour.

TROPICAL FRUITS.—The reason why tropical fruits are so generally unhealthy when eaten in temperate climates, is because they are almost always picked green and allowed to ripen during their transportation. No food is healthier than perfectly ripe fruit—either tropical or temperate—picked and eaten directly from the tree, especially when eaten at and as a part of regular meals.

What Sickness Costs.

The *Medical and Surgical Reporter* estimates the cost, to the people of the United States, of medical services and medicines, at \$100,000,000, and adds \$25,000,000 for the quack medicines swallowed. "Let the people," it says, "study these figures awhile, and then reflect that probably one-half, or certainly a large fraction, of this expense is incurred by a deliberate infraction of the laws of health; that, if they tipped less, smoked less, overworked less, were less 'fast' and less self-indulgent, they would save some thirty or forty millions a year."

If the cost of the loss of time, loss of happiness, loss of ability to do and dare was added to the above, there would be no counting the expense of sickness. And then add to this the expense of those indulgences that make us sick!

The truth is, sickness is the most expensive nuisance on the face of the globe. There may be instances where it makes people better, but generally it makes people selfish, sad, misanthropic, nervous, mean and miserable. The best way to make ourselves happy and good is to keep ourselves well. Then we are apt to be sweet and kind and wholesome. Moral reform societies and tract societies might learn a lesson from this fact, and do more good with less money than they are now doing.

Eating too Fast.

Eating too fast, generally involves eating too much—more than is needed for the support and nutrition of the body, and the reason for this is, that the organs of taste which are our guide in this matter, are not allowed sufficient voice; they are not allowed time to take cognizance of the presence of food ere it is pushed past them into the recesses of the stomach. They do not therefore have opportunity to represent the real needs of the system, and hence allow the crowding of the stomach. I hold that thirty minutes should be spent at each meal, and spent too, in chewing the food a good portion of the time; not in continued putting in and swallowing, but in pleasant chat and laugh instead of a continuance of the intense nervous pressure of the office or library. If you lay out to spend thirty minutes in this way at your meals you may rest assured you will not eat too much, and that what you do eat will be in the best condition for appropriation to the need of the system. You will be healthier in body, happier in mind, and more vigorous in brain—for there are few things that so clog the brain as a meal of half-eaten food put into the stomach.

OPEN THE DOORS.—Where there are children, it is of great importance that rooms and entries should be of the same temperature, for certainly a large proportion of the chest and bowel affections of the young can be traced to sudden changes of temperature, especially when the little ones are in the habit of passing from over-warmed rooms into somewhat under-warmed entries.

There is no need to dilate on the subject of ventilation; but even where stoves are used and a certain ventilation is thus afforded, our remarks hold true; for there is no doubt that all ordinary modes of burning coal pour into our rooms so much of the inodorous, tasteless carbonic oxides and other gases that we can hardly have too much fresh air with which to dilute it.

A GREAT LOSS.—The death of Prof. Ju-
lius L. Weisbach, on February 24th, at
Freiberg, Saxony, has inflicted a most se-
vere loss on the scientific and on the social
world. Dr. Weisbach was born in Saxony
in 1810, and received a position as instruc-
tor at the Freiberg Academy in 1833. Here
he rose rapidly in rank and reputation, and
was an "Oberbergrath" at the time of his
death. He was an excellent teacher, a
most kind and genial friend, a prolific writ-
ter, and a most original and intelligent
investigator, particularly in the depart-
ment of hydraulic engineering where he
was unrivaled. His "Mechanics" is a stand-
ard work which has been translated into at
least five languages, three editions of it
having been published in English. We
have no space to speak of his other numer-
ous and excellent writings, of his pre-emi-
nent good qualities in all the relations of
life. His death is a loss to the whole
world, and a particularly hard blow to the
academy which he so long honored. And of
all mourners, none will grieve more sin-
cerely than his many American friends.

MECHANIC ARTS COLLEGE LECTURE.—
Owing to the indisposition of Professor
Carr, no lecture was delivered last Saturday,
much to the regret of the many. There is
now a vacation of two weeks, and the course
will recommence on April 22d, when Prof.
Kellogg will begin his series of three lec-
tures on Greek and Latin, in relation to
English. Then will follow Professors
Pioda, Welcker and Swinton, and finally,
President Durant.

MINERAL SPECIMEN.—Mr. E. Durand, of
this city, has shown us a specimen of a
chrome mineral, which occurs in considera-
ble quantities at the New Almaden mine. It
is of a green color, is brittle, breaking up
into small scales and splinters, and occurs
impregnated in the rock. It is an impure,
clayey silicate of chrome,—chrome ochre.

THE recent flood swept away 25 bridges
in Morgan county, Illinois.

Ore Shipments.

We occasionally receive letters from
miners in the interior, making enquiries
as to what prices can be obtained for
ore in this city. To their enquiries we
are obliged to return unsatisfactory an-
swers. The purchasers of ores here are
unwilling to publish any price list, partly
from the American quality of secretiveness,
and partly from the fact that they fear to
bind themselves by any statement which,
they think, may be taken advantage of.
They say, therefore, when asked:—Send
the ore to us and we will give the most we
can.

This state of things is unfortunate in some
respects. The miner does not like to trust
to the purchaser and the purchaser cannot
trust always to the assays and statements
of the seller. We doubt not that the
result is that less ore or bullion is sent
here than might be sent with profit to both
parties.

The question then arises as to how we
can better the matter,—a question which
it is by no means easy to answer. The
miner would gladly have a scale of prices
given him by the purchaser,—to which the
latter is averse. He says that the ores are
so different in character, richness and
quality that such a scale cannot be fur-
nished. There is of course much force in
these objections,—all the more that the
nature of ores in any given locality is very
apt to change in time, especially as the
mines are in many instances developed to
only a comparatively small extent. Still we
think that a general scale might be fur-
nished with advantage to both parties.

The smelting works of Saxony publish a
very detailed tariff of prices. These are
regulated by the ingredients of the ore,
and their comparative amounts. The ores
are brought in a state of fine powder to the
furnaces and there weighed in the presence
of a representative of the mine and of one
of the smelting works. Three samples are
carefully taken at the same time, one for
the assayer of each party and one for the
government assayer. The latter is merely
referee in case the two assays differ materi-
ally, and his decision is final. The system
works excellently; but then the circum-
stances are entirely different from those ex-
isting here.

A "Nevada miner" asks whether the
establishment of a government assay office
would not be a "good idea." We are
afraid that it would not have the desired
results, even if we were sure of having a
proper person as assayer, of which fact we
cannot be certain until our civil service
has undergone the needed reform. At
present the buyers and sellers must make
the best contracts they can with one an-
other, until a vigorous competition brings
a change. We believe that the Auburn
Mill at Reno, however, publishes a scale
of prices, and we believe that Mr. Selby
and others here would do well to follow
the example.

During the three months just ended,
quite large shipments have been made to
this city, as shown by the following table,
where we give the amounts for this year
and for the corresponding months of 1870.

	ORE.				BULLION.			
	Interior.	South.	Interior.	South.	Interior.	South.	Interior.	South.
1871.	tons.	lbs.	tons.	lbs.	tons.	lbs.	tons.	lbs.
January	225	900	1	1,000	458	1,800	138	1,400
February	166	900	—	—	350	1,900	140	900
March	256	1,000	19	1,000	432	300	176	1,600
	648	800	21	—	1,242	—	455	1,900

Totals 669 tons 800 lbs. 1,697 tons 1,900 lbs.
Average per month: Ore, 223 tons 266½ lbs.; Bullion,
565 tons 1,966½ lbs.

	ORE.				BULLION.			
	Interior.	South.	Interior.	South.	Interior.	South.	Interior.	South.
1870.	tons.	lbs.	tons.	lbs.	tons.	lbs.	tons.	lbs.
January	169	1,660	4	400	—	—	46	900
February	109	250	—	—	—	—	47	1,500
March	119	326	19	200	45	1,000	26	1,000
	397	230	23	600	45	1,000	119	1,400

Totals 421 tons 830 lbs. 165 tons 400 lbs.
Average per month: Ore, 140 tons 943½ lbs.; Bullion,
55 tons 133½ lbs.

It will be seen from the above that there

has been a gratifying increase especially
in the amount of bullion, which last is due
to the erection of smelting works in the in-
terior. Of the bullion, one Nevada com-
pany alone has shipped at least 526 tons.
Of the ore, 330 tons were shipped as "cop-
per ore," and one lot of 8¼ tons came from
Mexico.

Of the new smelting works which were
to have been started in this city, we have
heard nothing definite of late, although a
lot of land was purchased some time ago at
Hunter's Point, and preparations are said
to be going on. Mr. Selby has, in the
meantime, been active in securing ore and
bullion, and has contracted with parties in
Nevada and Utah for their silver lead.

During the last quarter there have been
exported from this city 204 tons of silver
ore, 70 tons of lead ore, 350 tons of copper
ore and 87 tons various. Total, 711 tons.

A not unimportant item of our exports
during the quarter is that of 656½ tons of
lead to New York.

Ores from Eastern Nevada.

Since the above was written, we see that
the State Mineralogist of Nevada has pub-
lished his report for the years 1869 and
1870. We have not seen the report itself,
but the Sacramento Reporter publishes
therefrom tables showing the amounts of
ores and metal shipped from Eastern Ne-
vada during those years. We take these
data and rearrange them in tabular form to
suit our columns, giving the amount of ore
shipped to California in 1869 and 1870, and
the amounts of bullion shipped to the East
and to the West in 1870.

	Ore Ship'd to Cal.				Bullion Ship'd in 1870.			
	1869.	1870.	West.	East.	1869.	1870.	West.	East.
January	6	186	382	707	59	1,247	—	—
February	7	796	202	788	160	651	—	—
March	18	—	399	1,641	91	782	112	1,937
April	149	1,266	609	303	46	257	168	794

Totals 7,489 tons 144 lbs. 3,867 tons 913 lbs.

The figure with regard to the ore ship-
ment "show two interesting facts: First,
that about all the ores shipped from East-
ern Nevada for reduction comes to Cali-
fornia, either to be worked in San Francis-
co, or to be shipped thence to Europe. The
other fact is that the increase in the yield
of the mines of Eastern Nevada since the
opening of the railroad has been nearly
600 per cent. It will be seen that in 23
months 9,489 tons of ore were shipped,
worth on the average at least \$100 per ton,
or in the aggregate, \$948,900." These last
figures should read 7,489 tons and conse-
quently \$748,900. "During the whole
period (1869-1870) only 3,885 lbs. of ore
were shipped eastward."

In 1869, 51 tons 485 lbs. bullion are
given as shipped west, making the bullion
total 3,918 tons 1,398 lbs. "Here we have
3,918½ tons of metal shipped last year"
(and in 1869) "worth about \$250 per ton
on the average, and in the aggregate \$979,-
625. It will be noticed that while the
shipments in this direction have been con-
stantly on the increase, shipments to the
East have been diminishing since June."

In the Press of January 7th, we pub-
lished a tabular statement of all the ores
and bullion received in this city for 1870.
By a reference to this it will be seen that
the above figures are considerably higher
than ours. Our amounts were taken from
the books of the Central Pacific Company
and were carefully revised at the end of
the year. How the State Mineralogist has
obtained his, we do not know, but we are
inclined to think that ours must be the
more correct.

LAST Thursday, the 50th Anniversary of
the Declaration of the Independence of
Greece from the Ottoman Porte, was ap-
propriately celebrated by the Greek resi-
dents of this city.

Pacific Coast Coals.

We are permitted to publish the follow-
ing analyses of coals from California, Ore-
gon and Alaska, made by C. M. Cresson,
M. D., of Philadelphia. We represent the
coals by the initial letters of the localities:
A., Alaska, 7-foot bed; C.B., Coos Bay,
Oregon; S., Seattle, Washington Territory;
B.D., Black Diamond, Mt. Diablo; B.B.,
Bellingham Bay, Oregon [Washington
Territory.—Eds. Press.]; C.A., "California
Anthracite."

To these Dr. Cresson adds: C., Cumber-
land coal; P.G., Penn Gas coal of Western
Pennsylvania; A., a variety of anthracite
from Eastern Pennsylvania; P., Crude
Petroleum from Pennsylvania.

The first column shows the percentage
of coke; the second, of volatile matter, the
third, of ash; the fourth, the number of
pounds of sulphur in a ton of the coal; the
fifth, the relative heating powers—how
many pounds of water are evaporated by
one pound of coal; the sixth column esti-
mates the relative value of a pound of each
of these coals, the Penn. Gas coal being
assumed as a standard.

	Coke.	Vol.	Ash.	Sul.	H.P.	R.V.
A.	60.0	40.0	12.3	7.96	7.94	.641
O.B.	60.7	39.3	6.2	7.35	10.14	.691
S.	63.0	37.0	16.6	8.57	8.38	.571
B.D.	51.6	48.4	8.0	8.73	8.38	.571
B.B.	67.0	33.0	15.0	6.61	10.68	.721
C.A.	88.6	11.4	5.0	6.12	9.70	.661
C.	88.2	11.8	3.2	3.52	13.92	.948
P.G.	62.5	37.5	3.2	13.78	14.67	1.000
A.	95.6	4.4	7.2	—	7.40	.504
P.	—	—	—	—	20.90	1.424

The specimens from which these analyses
were made, are in marked contrast with one
another. The Alaska coal is a dirty-looking
lignite-like coal, which no one familiar
with Pennsylvania and Illinois coals would
expect to compare favorably with the
shiny, rich-looking Black Diamond, which
nevertheless is very little if at all its super-
ior. The Seattle coal looks very much
like some of our lowest beds in the old
Coal Measures, and the Puget Sound
anthracite is, evidently enough, made out
of it, by volcanic agencies driving off 10 or
15 per cent. of volatile matter. The low
percentage of ash in this anthracite makes
it unlikely that the changed bed is the
same with that from which the unchanged
coal comes, although the inference is not
a necessary one; for the percentage of ash
in the same bed varies with every square
mile of its area, and almost with every
square rod; as, indeed, the theory of the
origin of coal beds would lead us to antici-
pate.—U. S. R. & Min. Reg.

Fata Morgana at Santa Cruz.

The Santa Cruz Sentinel, of April 1st,
says: On Wednesday morning last, one of
the finest mirages that it has been our good
fortune to see made its appearance in our
bay; in fact the picture partook more of
the Fata Morgana than mirage. Standing
on the bluff, near the light-house, we
watched the beautiful scene for hour after
hour. It was one of those scenes which at
times makes its appearance on the coast of
Messin. The entire beach, with its narrow
line of yellow sand extending from Point
Pinos entirely around to this place, and
the many landing places and towns became
visible, looming up like gigantic castles.
The houses in Monterey, twenty-two
miles distant, appear to hang in the air,
and as if gently rocked in a sea of glass.
The mountains back of that city, and the
light-house, formed a splendid back-
ground. Far away on the right could be
seen an ocean steamer, which, at times,
seemed to be four or five stories high, with
heavy roll plowing her way to the Golden
Gate, and the bay towards Moss Landing,
the buildings of the landing constantly
growing taller and taller, the steamer Mon-
terey making her way to this city. In the
immediate fore-ground were five or six
schooners tacking in different directions,
and passing and repassing each other, ad-
ding to the beauty of the scene. We
watched this shifting kaleidoscope, while it
changed into every imaginable shape. The
line of sand beach became rough, and
waves like those seen on the intervening
bay seemed to roll along the shore. The
opposite shore ran up massive columns,
supporting a stupendous entablature,
which grew wider at the top, then
changed and represented beautiful water-
falls or precipitous bluffs. This would
give place to a city, whose magnifi-
cent buildings would appear to rock, then
rising, would remain a moment suspended
high in the air, then disappear, while an-
other picture was forming on the water's
level. A gentle breeze was blowing at the
time, and the day was warm and clear.

ONE firm in Boston does an annual busi-
ness of \$800,000 in proprietary medicines.

How Chromos are Made.

The impatience of a German washerwoman is said to have led to the invention of lithography, and this history of the art to have begun at Munich about 1793. The first patents relating to chromo-lithography bear the date of 1835, but in the last 34 years the art has made a wonderful progress.

We give this week another fine engraving from one of Prang's excellent chromos. It is entitled "Launching the Life Boat," and is after a painting by Edward Moran of Philadelphia. Our readers will remember the picture of "Sunset on the Coast," by De Haas, which appeared in the Press of Feb. 11th. With their success with these two productions the publishers are well content. They do not hesitate to say (we quote) that in the reproduction of these two pictures they have given to the public two master-pieces of American art, such as have never before been approached by the hand of the chromo artist. Although Mr. Moran's picture is in perfect contrast to Mr. De Haas', the two are nevertheless most excellent companion pieces. While the latter is glowing with color, the former is

gray and sombre. Here the storm is yet raging in its fury, and the heavens are covered with black clouds. There it has already spent its force, and through the riven cloud-veil a flood of light is bursting upon the destruction which the storm has wrought. There the work of destruction is completed; the vessel which once bore hopeful hearts towards an unknown goal has stranded; the hopeful hearts, mayhap, are no more; the struggle is over; the brig is abandoned, and no sign of life is to be seen, far or near, with the exception of a few sea gulls and some sails showing faintly on the distant horizon.

Here the struggle is yet going on. The vessel in distress in the offing, the lifeboat just about to be launched, the crowds of men thronging the shore, and eager to extend a helping hand to their suffering fellowmen,—all these tell a story which, although totally different, is yet a complete counterpart of that told by the "Sunset on the Coast." While one may be called the opening scene of the tragedy, the other illustrates its close.

Both of these fine chromos may be seen at the art gallery of Messrs Snow & Roos, at 21 Kearny street in this city.

We have before promised a description of how chromos are made, which promise we now fulfill, using Mr. Prang's "Chromo," therefore.

A lithograph, as our readers are aware, differs from a steel engraving and a wood cut, by the fact that it is printed from a stone, and from a perfectly smooth surface. In a steel engraving the impression is produced from an indented plate. That is, the steel is cut into with a sharp instrument, the incisions are filled up with ink, the paper is pressed into them, and thus an impression is secured. In a wood cut, on the contrary, as with common type, the impression is made by the ink deposited on a raised surface; all the parts that are intended to be blank in the picture having been cut away. An entirely different method obtains in lithography. Here there is neither raised nor sunken surface; everything, as one writer has expressed it, is as smooth as a politician's ante-election promises.

A lithograph is printed on large slabs of stone,—known as lithographic stone,—quarried in Bavaria, containing carbonate of lime, which,

as is well known, has a strong affinity for oils. These slabs are three or four inches in thickness; before they are used they are polished to their utmost capacity, and they readily take an exquisite finish. If it is desired to print a portrait, for example, the drawing is made directly on the stone, either with a lithographic crayon or with a pen charged with lithographic ink. A lithographic pencil is simply a hardened piece of fatty matter, colored black in order to show the marks; and lithographic ink is a black fluid charged with oily ingredients. The oil in the ink or pencil forms a chemical union with the line of the stone, and the application of certain acids fixes it indissolubly. It only remains, now that this result has been reached, to fill up the pores of those parts of the stone which were intended to be blank, with gum, in order to prevent the ink when applied afterwards from adhering to them. This done, which gives a certain enamel to the blank spaces, the stone is placed on a press and wet with a sponge. The ink, or color, is then applied with a roller. Of course, the gummed portions of the stone, having retained the moisture from the sponge, reject the oily color; whereas the drawn or oily

viewed at a short distance, could be detected as an imitation. Prang's chromos, seen at distances of a few feet, have deceived the best artists in the country, who quite as frequently select his work, as the painting, for the original picture.

It may strike the reader as extraordinary that it is possible in a picture which has gone through the press between twenty and forty times to be able to obtain that exactness in "registration,"—to use a technical phrase,—which enables the workmen to print the color in precisely the right place every time. For any one can readily see that if the paper were to shrink a little, or if the pressman were not to hit the exact spot, the eyelashes of the "Barefoot Boy," for instance, might be planted in the center of his pupils, or promoted to the rank of brevet eyebrow. But this difficulty is ingeniously overcome in chromo-lithography.

This first process in making a picture, is to trace a skeleton outline, not of the figure or composition only, but of the shade and colors; and this is transferred to every stone used in the production of a chromo. The artists, therefore, know where to rub in the greasy drawing,

Caribou, Colorado.

A correspondent of the Colorado Herald gives some information concerning the mineral deposits of this place, which, if correct, would make it a very interesting field for investigation, and would give promise of future rich developments.

According to the letter, between that place and Long's Peak, which is near the northern boundary of Boulder county, there are four distinct and entirely different metallic formations, viz: silver, lead, gold and copper. First, along the southern side of Grand Island District is the Caribou silver belt. North of that, some six or seven miles, is a group of lead veins, which can be traced from the mouth of the North Boulder gorge, where the Asbestos lode is located, in an easterly direction, along the mountains of the Four Mile, for about eight or ten miles—the veins preserving their lead character until they wholly disappear. The amount of silver which they carry averages as much as galena ores usually contain.

Next in order come the mines of Ward District, which are worked almost exclusively for gold, the accompanying metal being principally pyritous iron, consequently not valuable at present. This group of gold-bearing veins also appears very close to the foot of the range, and is traceable in an easterly course to "Gold Hill," where it terminates in a cluster of remarkably rich lodes. Adjoining Ward, and further on to the north, is found the copper belt of St. Vrain, which is first noticed at the head of that stream, cropping out along down its valley and adjacent mountains, until it is forced to disappear beneath the sedimentary rocks at the edge of the plains. The veins of this belt are called the great

copper deposits of Colorado, and will eventually be worked for copper as the principal product, though some of them are rich in silver. Sulphur of copper is the predominating ore.

The mines of Jamez Creek, lying between the Ward and St. Vrain belts, at their eastern extremities, partake of the nature of both, or a curious mixture of almost all metals and minerals, the veins running in all directions; and is what might be termed a pseudo formation when compared with the systematic character of the others.

The Southern Pacific Railroad.

We learn on good authority that the work of extending the Southern Pacific Railroad beyond Gilroy will commence on Monday next. Mr. Sturtevant, who was the energetic and able Superintendent of Construction on the Central Pacific, began grading at Gilroy on that day with a force of 500 men, and as fast as the grade is completed the track will be laid. The section of 20 miles required by Act of Congress to be constructed within the year ending in July next, will speedily be completed, and the Company may go beyond that, probably building as much as 50 miles south of Gilroy in time to transport this year's grain crop.

We cannot learn what route will be followed below Gilroy. Two lines have been surveyed and located—one through Pacheco Pass, and one through Panoche Pass via Hollister; but the Company has not yet decided between them. The latter route offers 30 miles of level grade before the hills are reached; the former only 10 miles. The more rapid progress in road building, therefore, could be made by the Panoche route, which would also better utilize the Gilroy road. But whichever route may be decided upon, the public will be gratified with the assurance that the road is to go ahead.—*Bulletin.*

LAUNCHING THE LIFE BOAT. BY MORAN.

portions of the stone, having rejected the water, retain the greasy ink. The paper is then put on, and the impression taken.

In making a plain lithograph, this is the whole process and it is repeated as often as an impression is taken—every time, the stone must be sponged before it is inked. A colored lithograph is first printed as a plain proof, and the colors are printed on the black surface afterwards. This is what Mr. Prang terms a "half-chromo." Such colored lithographs may be, and often are, quite pretty pictures, but they have no depth, and no "feeling of oil" about them—they are good enough for an undeveloped taste, and good only as far as they cultivate a love for something better and more beautiful.

Chromos, on the other hand, "full chromos," are produced by pure color—by carefully printing tint over tint, color over color, here a little, there a little, now deepening, now heightening, now shading, now brightening—following the method although not the tools of the artist with the brush and palette. The first color is commonly a light ground tint which covers all the print, or most of it, excepting, for example, in a figure piece, the spots to be covered by the eye, or to be rendered in white, which a gray or pinkish ground tint would spoil. The next, and every succeeding stone,—up, sometimes, as high as forty-three stones,—each have a separate color, which is applied, as the subject and stage of progress indicates, either to a minute portion of the picture or to nearly all of it. This process is continued until all the effects of the original have been produced; and no chromo is entitled to be regarded as a masterly one which,

in order to print a shade, and where to apply the gum in order to fill the pores of such stones—and know it with an infallible accuracy, in which guessing, or skill of hand has no part whatever. In the same way the pressman, if he is a skillful hand,—and no others are employed,—by simply making sure that he always puts the sheets into the needle-holes of the first impression, is sure to hit the mark in his work; but it depends on his sobriety, evenness of temperament, mechanical skill, knowledge of colors and trained eyes whether all the impressions are of equal value. For, if he should lay on the color too thickly or too thinly, the blemish or defect—the excess or lack of tint—would be instantly detected by the practised eyes of the master in the completed work. After the picture has gone through the press it is embossed, or has imparted to it that appearance of being painted on canvas which every one must have noticed on Prang's chromos. The "loaded touches" of the brush are excellently imitated, and the effects of such tricks of the artists are well rendered in the chromo. The picture is then gummed to pasteboard, cut, trimmed, varnished, touched up by the brush if defective, and sent to the store-room for sale. By a visit to Messrs. Snow & Roos, one can easily satisfy himself how accurately and excellently chromos are made.

ROBERT HOE is said to be making arrangements to establish a manufactory of his largest presses in England, on account of cost of material and price of labor.

DOMESTIC ECONOMY.

Healthful Economy in Bread.

Many people who now use fine flour altogether, would employ unbolted flour universally if it could be as readily obtained as the former and perhaps a little cheaper, as they would thus be able to combine economy with the true principles of dietetics. Millers generally charge as much for unbolted flour, as for that which is bolted; but there is no reason why they should do so. Unbolted meal ought to be considerably cheaper per sack or barrel, than that which is subjected to extra labor, and diminution by having a large proportion of that which possesses the least pecuniary value taken from it.

But there is a way to avoid this imposition—by simply buying the middlings (best shorts) and good bran which have been taken out by the miller, and mixing them together, in the same proportions in which they would exist if the wheat had been ground up without bolting. There is but little labor in mixing, while the cost of the mixture to make a given quantity of bread, will be much less than though the same quantity was made from fine flour alone.

No harm will arise, even if an undue proportion of bran finds its way into the flour, and any good domestic bread maker may produce as light, sweet and wholesome bread from such a mixture as can be obtained from the best bolted flour. Such bread is far more wholesome than the common white bread, and to dyspeptics it is indispensable. It is more digestible, and of the phosphates, so essential to the stamina of the system, it contains 17 pounds in 100; while flour, bolted to the degree of "superfine," contains only 6 pounds in 100—nearly three to one. These facts are of the utmost importance to every person, and deserve far more consideration than is usually allotted to them.

How to Buy Meat.

Dr. Letheby gives the following description of good and bad meats, with which his duties as sanitary officer in the city of London have required him to be very familiar:—Good meat is neither of a pale pinkish nor a deep purple tint. It has a marbled appearance, from a ramification of little veins of intercellular fat; and the at of the internal organs especially is firm, hard and suety, and is never wet, whereas that of diseased meat is soft and watery. The feel of healthy meat is somewhat elastic and hardly moistens the finger. Diseased meat is soft and wet. Good meat has but little odor, and this is not disagreeable; whereas diseased meat smells faintly cadaverous. Good meat bears cooking without much shrinking or losing much of its weight; but bad meat shrivels up and boils to pieces; this is due to the larger proportion of watery and gelatinous material, and the absence of fat and true muscular substance in the meat. Under the microscope the fibre should be clear and well defined, and free from infusorial animalcules; while that of diseased meat is sodden and tumid, as if it had been soaked in water, the transverse streaks are indistinct and wide apart, and animalcules abound in it.

Delicate Hands.

"Why don't my hands look and feel, as it would seem that the perfect Author of all things would have them?"—How many a young man and woman have asked this question; and are troubled to know why it is that some persons have such bloodless hands, perfect nails—so free from *hang nails*, as they are called—while their own hands look so much like duck's feet or bird's claws.

All sorts of cosmetics, the most penetrating oils, rubbing and scouring the hands, paring and scraping the nails, and cutting round the root of the nails, are resorted to, in hopes of being able to make their hands appear natural; but all avails nothing, and many a poor hand is made to perform all its manipulations *incognito*. About the piano, in the social party, in the house and

in the street, the hand—the most exquisite, or what should be the most beautiful and useful part of the human frame—is *gloved*; and why? Because it is not fit to be seen.

Now, we are about to tell you of a positive cure. In the first place, never cut or scrape your finger nails with a knife or scissors, except in pairing them down even to the end of the fingers.

Secondly; use nothing but a good stiff nail brush, soap and water, and rub the nails and hands briskly with these, every morning the *year round*.

In the third place, I would have you know that surfeiting will invariably produce heavy burning hands. An impure state of the blood will manifest itself in the hands sooner than in most other parts of the body. If you have bad hands, be assured that the quantity or quality (or both) of your diet, is wrong.

If you *try* to profit by these suggestions, you will, before one year expires, be no longer ashamed of your hands.

Soups.

Generally the American people are not fond of soups; perhaps because they are seldom well made, and when they are, they are often complicated and expensive, requiring much money, time and attention to prepare them. These difficulties are avoided in the following receipts, and a few trials will enable any one of ordinary understanding, who will follow the directions, to produce cheap, wholesome and agreeable soups, without shins, knuckles, scrags, bacon or drippings.

PEA SOUP.—Put one pint of split peas, which have been previously soaked in cold water four hours, into two quarts of pure soft water. Distilled, or filtered rain-water is preferable when it can be obtained. Let them boil for one hour, then add one carrot, one parsnip, one turnip, two onions, a small head of celery and a little mint, all cut small, and boil the whole another hour. Strain the soup from the vegetables, and thicken it with a little Indian meal, previously mixed in cold water; boil the whole for ten minutes more, and serve in a tureen with toasted or plain wheat-meal bread. (Mix the vegetables well, and put them into a mold or a basin and then into a vegetable dish, and serve it with steamed or baked potatoes, which are better than when boiled in water.)

BEAN SOUP.—Wash and pick one pint of white beans; steep them twenty-four hours in pure soft water, put them into a stew-pan (earthen, enameled is best), set them on the fire in two quarts of water, let them boil for two hours, then add two onions, one parsnip, one carrot, a little parsley and thyme cut small, a little cold boiled rice, and a little salt. Boil the whole gently for another hour, and serve it the same as pea soup.

BARLEY AND BREAD SOUP.—Take three ounces of barley, one and a half ounces of stale bread crumbs, one and a half ounces of butter, one half ounce of salt, and one quarter ounce of parsley. Wash and steep the barley for twelve hours in one-half pint of water, to which a piece of carbonate of soda, the size of a pea, has been added; then pour off the water not absorbed and add the crumbs of stale bread, three quarts of boiling water and the salt. Digest these in a salt-glazed covered jar, in the oven, or boil them slowly in a well-tinned covered pan, for from four to six hours, adding the chopped parsley, with the butter, thirty minutes before the expiration of the time of boiling.

HOTCH-POTCH SOUP.—Take four large turnips, one pound of carrots, one onion, one lettuce, and parsley. Put four quarts of water into a pan, set it on the fire, and put in the carrots and turnips, part of which must be grated, and the remainder cut in small square pieces with the other vegetables, all cut small; season, and let all boil very well together slowly. Young green peas may be added, part of them to be put in with the other vegetables and the remainder about an hour before the soup is ready.

STUFFING FOR FISH.—Butter slices of stale bread upon both sides; saturate them with wine, catsup, or cream, as preferred. Cut again in smaller slices, and lay inside the fish.

TO SAVE FRUIT WITHOUT SUGAR.—Put in wide-mouthed bottles; fill up with cold spring water. Put them in a vessel of water up to the neck; boil half an hour; tie bladders or oil-skin over tight, or cork and seal while hot. Let them set until cold. Keep in a cool place. Use as soon as opened. Pack away around while boiling, to steady them.

Domestic Receipts.

OINTMENT TO SOFTEN THE HANDS.—One and a-half pound of mutton tallow, one ounce of tallow, one ounce of camphor gum, one ounce of glycerine, melted; when thoroughly mixed put away to cool. Rub on at night.

TONGUE TOAST.—Take cold boiled tongue, mince it fine, mix it with cream, and to every half pint of the mixture allow the well beaten yolks of two eggs. Place over the fire and let it simmer a minute or two. Have ready some nicely toasted bread; butter it, place it on a hot dish, and pour the mixture over. Send to table hot.

A **GOOD DISH** may be made, for those who like pork, as follows:—Take slices of home-fed pork and set them over a good frying fire in the spider with a little salt. Core and quarter some nice tart apples and add them to the pork, covering the spider with a lid. Cook till all is of a nice brown and serve hot, with the apples spread upon the slices.

TO PRESERVE FIGS.—Take the fruit when not quite ripe. Soak for ten or fifteen minutes in weak, warm soda water to remove the skin; or peel thinly with a sharp penknife. To one pound of figs use three-quarters of a pound of sugar. When the syrup is made, put in the fruit, and let it boil until half done; take them up, and spread on a dish, and put in the sun. Let the syrup simmer slowly, always carefully removing any impurities that may rise to the surface. When clear, put in the figs; let them cook until transparent, taking them out separately when done. Set in the sun again; if the syrup is not clear, skim again; do not let it boil away too much. Put the figs in jars, and when the syrup is cold, pour it over them.

The small kind, called the Celestial fig, is better unskinned.

Mechanical Hints.

GILDERS' COMPOSITION FOR FRAMES.—The composition at present in use is composed of best black glue, common resin and linseed oil. Some use resin oil, others boiled linseed oil. Nearly every manufacturer has a little change in the proportions. It is a useful material for many other purposes to which it might be applied were its mode of manufacture known. Take 10 lbs. of best black glue, boil it in the usual manner, but with very little water. It should be at least four times as thick as the glue used for general purposes. Take 6 lbs. of common resin, and pound to dust; add linseed oil, or resin oil, to form a thick paste with the dust; dissolve with heat, allow it to cool to about 212°, then add the hot glue together; combine it well. Have sifted whiting prepared, and combine the whole as in making bread; form it into cakes, and allow it to cool; at any time by the application of steam or heat, this composition may be brought into use.

WELL WORTH KNOWING.—It is a matter worth knowing that a tree felled while in full leaf in June or July, and allowed to lie with their tops and lops on till every leaf has fallen, are then very nearly dry, as the leaves will not drop of themselves till they have drawn up and exhausted all the sap in the tree. The time required is from a month to six weeks, according as the weather is dry or moist. Trees so treated will never push again, or show leaves, as the stocks of winter-felled timber almost invariably do if allowed to lie, and thus prove that they have lost that vitality which the latter retains. The floor of a mill laid with poplar so treated and cut up and put in place in less than a month after the leaves fell, has never shown the slightest symptom of shrinkage or other indication of not being perfectly seasoned.

BILLIARD BALLS may be colored red by first steeping in a mordant of nitro-hydrochlorate of tin, and then plunging them in a hot decoction of brazil or cochineal; afterwards placing them in cold water. Experiments will teach the proportions, which influence the shade of color. Tiu mordant—Mix four oz. hydrochloric with one of nitric acid and one of water; dissolve in it, by small portions at a time, two drachms of grain.

TURNERS' CEMENT.—Take Burgundy pitch and resin, one pound each; yellow wax, two oz.; whiting, one ball. Melt in a pot over a slow fire, pound the whiting and add it gradually to the other ingredients when melted. When thoroughly mixed, mould it into balls or sticks.—*Campin's Turning.*

LIFE THOUGHTS.

ENDEAVOR for the best, and provide against the worst.

How to BE NOBODY.—Spend your leisure hours in a drinking saloon.

THE best humor is that which contains the most humanity.

LIFE is hardly respectable when it has no generous task, no duties or affections that constitute an object for loving.

In youth we should cultivate mind and character, that we may reap the ripened fruit thereof in old age.

HEROES may destroy tyrants, but it is wisdom and law that prevent tyranny and oppression.

In every pursuit, whatever gives strength and energy to the mind is favorable to the interests of knowledge and virtue.

WHATEVER limits or enfeebles the power of the mind, is hostile to the best interests of human life.

THE BEST WAY to acquire the faculty of being at home in the best society, is to stay at home with one's wife and children.

REFINED homes are the end of civilization. The work of all races for thousands of years is represented by the difference between a wigwag and a lady's parlor. It has no better result to show.

GENIUS in a man to-day is individualism of character and effort, the power one here and there is seen to have to light his own fire and drive his own engine.

AVOID those who take pleasure in exposing others to contempt by jeering, mocking, or mimicking. Keep off from such as from the heels of a horse that kicks all near him.

FRIENDSHIP, love and piety ought to be spoken of only in the rare moments of perfect confidence be mutually to understood in silence.

SPURGEON says nobody is more like an honest man than a thorough rogue.

If a man sleighs all day, can he be said to kill time.

What is Life?

As we sit at our table to-night, thoughts of the past, present, or future crowd upon our mind, and we naturally ask, what is life? What is there in this world of sin and sorrow that should claim our attention, or cause us to have one wish to continue here? We look around, and we behold suffering and sorrow; there lies the infant baby, who never committed one sin, writhing in pain; over it bends the kind mother weeping and feeling as none but a mother can feel. Youder we hear a wailing which comes from around the couch of the dead. Sickness, sorrow, anxiety, and fear stalk over the earth and meet us on every hand. Why should we not ask, what is life? and the answer comes from the heart, life is one continual scene of sorrow. But the grave awaits us, and in that house which God has prepared for all his suffering children the weary can find rest.

WHAT IS A MAN?—No man is a man till he is tried; till he has passed through the ordeal: through deep water and scorching fires. A man surrounded with comforts, friends and relations, food and raiment; whose barns are filled with plenty, and whose presses gush out with new wines; who eats his fill; sits and reads, doles about taking his ease and pleasure; smoking his pipe and chewing his cud; is he a man? Far from it. A man is not a man until he is proved—has passed the ordeal—drank the bitter cup; risen above life's conflicts; mounted the billows of the sea.

Few traits of character are more valuable than the possession of good temper. Home can never be made happy without it. It is like flowers springing up in our pathway, reviving and cheering us. Kind words and looks are the outward demonstration; patience and forbearance are sentinels within.

TRUE COURAGE.—A learned man has said that the hardest words to pronounce in the English language are, "I made a mistake." When Frederick the Great wrote to the Senate, "I have just lost a battle, and it is my own fault," Goldsmith says, "His confession showed more greatness than his victories."

DR. JOHNSON said, when in the fullness of years and knowledge: I never take up a newspaper without finding something I would have deemed a loss not to have seen; never without deriving from it instruction and amusements.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier.
You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,
For the Variety of Places and Purposes to which it is adapted, the Readiness with which it sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render All other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous.
Please favor us with your orders PROMPTLY, and oblige

NEW BOOKS.

FARM IMPLEMENTS AND FARM MACHINERY, and the Principles of their Construction and Use: with simple and practical Illustrations of the Laws of Motion and Force as applied on the Farm. With 287 Illustrations. By John J. Thomas. New York: Orange, Judd & Co., 245 Broadway. 8vo. pp. 302.

This publication contains very much of general interest and value while intended more especially for the farmer. It commences with the leading principles of mechanics which are applied every day by the farmer, and presents these in a simple and interesting form. They are important in teaching the reasons of success and failure, that the practical agriculturist may not be guided by random guessing. Then follow pages of excellent matter concerning farm implements.

The practical, every day value of such a book as this is very great, and we cheerfully recommend it. It is by the possession of such knowledge as is here given that our agricultural classes are raised above the condition of those of less civilized races. This knowledge not only improves the mind but it saves money, enables the farmer to judge between good and inferior machines, and tells him how to most easily obtain his objects. Nothing shows the advancement of modern agriculture in more striking light than the rapid improvement of farm implements, and perhaps nowhere is the ability to improve on what the farmer uses, possessed to a greater extent than on our coast. In aiding greatly for the still more general diffusion of such knowledge and ability, a book like this is a great help.

HINTS TO HORSE-KEEPERS, a complete Manual for Horsemen. By the late Henry William Herbert (Frank Forester) With additions. Illustrated. New York: Orange, Judd & Co. 8vo. pp. 425. Price, \$1.75.

The basis of the present work is the valuable matter written by Mr. Herbert shortly before his death, comprised within the first thirteen chapters. An extension of the work was undertaken by the author, and the outline of the remaining chapters was being filled out by him, when that strange and fatal mood overshadowed his life, and terminated his earthly labors. In committing the unfinished task to other hands, the publishers have been particularly fortunate in procuring, for each department, competent and experienced aid.

These Hints to Horse-Keepers are intended to include every subject of interest to those who, for pleasure or business, own or use a horse. From their comprehensiveness they are necessarily brief and condensed. More elaborate works on each speciality have previously been in the hands of the public, and this volume is not adapted, nor intended, to supplant them; but by presenting in one volume a compend of our valuable standard works, with the latest discoveries and improvements, it is believed the publishers have answered a demand till now unsupplied.

MONEY IN THE GARDEN.—A Vegetable Manual, prepared with a view to Economy and Profit. By P. T. Quinn, Practical Horticulturist. New York: The Tribune Association. Illustrated. 8vo. pp. 268.

In this work the author aims to give (and succeeds admirably in his aim) instructions on three distinct, although closely connected, branches of gardening—the kitchen-garden, market-garden, and field culture of root-crops—his credentials being a successful practical experience of years. He writes simply, concisely and to the point. The objects, reasons and style may be judged of to some extent by his preface which we here give.

Now-a-days a non-literary practical man, if tolerably successful in any speciality, must do one of two things. He either must keep his own counsel and reticently go on, making what profit he may, or be prepared daily to answer a thousand-and-one questions by mouth, and by letter, conscious that his "pursley" is getting ahead of him, while he casts and recasts multitudinous counsels from his one little mould of experience.

There is a way of evading these alternatives, though it may call for a radical change in the nature of the aforesaid practical man. He can go into a book, there say whatever he has to say, and, going out again (backward at the preface), explain humbly: friends, you will find it in all this volume. I've been as matter-of-fact and explicit as possible, avoiding speculation, and putting down, briefly, things I have learned from daily toil and the wisdom of other men.

This is why these two hundred and sixty-eight pages of simple and conscientious directions are given to all who, by saving or gaining, hope to find "Money in the Garden."

Meteorological Observations.

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D. Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N., Long. 121° 29' 44" W. Height above mean low tide, at San Francisco, 74 feet. Height of lower surface of mercury, 34 feet. The amount of cloudiness is designated by figures, 0 being entire cloudiness; 5, half cloudiness; 10, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 0 being a calm, 1 a very light breeze, and 10 a hurricane. The means are derived from three daily readings at 7 A. M., 2 P. M., and 9 P. M., in conformity with the arrangements of the Smithsonian Institute.

* Thermometograph. † Rain.

REMARKS.—Although the weather of the week has been fraught with disappointment and dismay to the agriculturist, on account of the fierce, desiccating winds that have prevailed, we see no reason yet for despairing of an average harvest. The young grain is not so much injured but that it will revive under the influence of a much less supply of rain than the average fall of April would afford; and at the present writing (April 2d) the prospect is favorable for a speedy contribution of the much needed aqueous precipitation. Within the last 24 hours the barometer has fallen two-tenths of an inch, and the wind is in the right quarter for rain.

Meteorological Report—San Joaquin Valley.

Rain table for a portion of San Joaquin Valley. Prepared for the Press by J. W. A. Wright, from observations since September, 1868, between Tuolumne and Merced Rivers, nine miles south of Empire City and ten miles east of the San Joaquin, in T. 6 S., R. 10 E., Mt. Diablo to meridian and base line.

Lat. 37° 38' N.; long., 120° 55' W. Height above sea, about 100 feet.

MONTHS.	1868.	1869.	1870.
September.....	0.00	0.00	0.00
October.....	0.00	0.00	0.00
November.....	0.95	0.49	0.32
December.....	2.83	0.99	1.89
Total for each year to Jan. 1st....	3.78	2.67	2.46

MONTHS.	1869.	1870.	1871.
January.....	2.62	0.89	0.90
February.....	3.53	2.79	1.44
March.....	3.54	1.17	0.31
April.....	0.99	1.00	—
May.....	0.65	0.00	—
June.....	0.00	0.12	—
July.....	0.00	0.00	—
August.....	0.00	0.00	—
Total.....	15.11	8.64	—

REMARKS.—It will be observed that the amount of rain to April 1st, this season, is 5.11 inches, while to same date, 1870, it was 7.52; and to same date, 1869, it was 13.47 inches. Yet so well has the rain-fall been distributed the past winter and spring, so many cloudy days have we had, and such heavy fogs and dews, that the early sown grain on our loose sandy loam, when well plowed, is forward enough to promise a fair yield if we have a few moderate and well-timed rains in April and May. [The telegraph informs us that the rain of Wednesday reached the locality of our correspondent,—Eds. Press.]

Copper, old.....	— 47 @ —

ALVARADO, March 13, 1871.

Messrs. Dewey & Co.—Gentlemen: I am happy to acknowledge the receipt of my letters sent on Mop Holder. I am entirely satisfied with the manner in which you conducted my case. I can assure you that I shall not fail to recommend your method of business to all others having patents to obtain. Yours, etc., JNO. BRIZEE.

PERSONAL.—Wm. H. Murray, representing the SCIENTIFIC PRESS, of San Francisco, California, called on us this week. He is visiting the principal manufacturing points in the United States in the interests of said journal. The Press is a fine looking sheet, same size as the Scientific American, and is now in its 22d volume.—Iron World, Pittsburgh.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper, or blank slip, WITHOUT the name and residence of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

Readers addressing parties on business, from intelligence given in this journal, will confer a favor by stating the source of their information.

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose \$5 piece in a registered letter, in which case we will be responsible for its safety.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$87.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-hp-ft

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoes, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adopting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills Bruges, Belgium. fe25-ly

Eighth Industrial Exhibition,

UNDER THE AUSPICES OF

THE MECHANICS' INSTITUTE,

San Francisco,

WILL OPEN

Tuesday, August 10, 1871.

And continue for four weeks, in the Pavilion of the Society, on Union Square, in the city of San Francisco.

APPLICATION FOR SPACE can be made at the Library of the Mechanics' Institute any day, between the hours of 1 and 9 P. M., or by letter to the Corresponding Secretary, H. C. KIBBE.

Mr. J. H. GILLMORE is authorized to visit those who intend to exhibit from this city. fe18-16p-ft

Scientific and Practical

BOOKS

—ON—

MINING, METALLURGY, ETC.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Published and Sold by

DEWEY & CO.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price \$2.50 coin, or \$3 currency, postage free.

For single copies of the above works, or for the trade, address

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office, San Francisco.

[No. 2.]

NEW 7-30 GOLD LOAN.

Safe! Profitable! Permanent!

JAY COOKE & CO.

Offer for Sale at Par and Accrued Interest the

First Mortgage Land Grant Gold Bonds

OF THE

NORTHERN PACIFIC R. R. CO.

These bonds are secured, first, by a First Mortgage on the Railroad itself, its rolling stock, and all equipments; second, by a First Mortgage on its entire Land Grant, being more than Twenty-Two Thousand Acres of Land to each mile of Road.

The Bonds are free from United States Tax; The Principal and Interest are payable in Gold—the Principal at the end of Thirty years, and the Interest semi-annually, at the rate of Seven and Three-Tenths Per Cent. per annum.

They are issued in denominations of \$100, \$500, \$1,000, \$5,000 and \$10,000.

The Trustees under the Mortgage are Messrs. Jay Cooke, of Philadelphia, and J. Edgar Thomson, President of the Pennsylvania Central Railroad Co.

These Northern Pacific 7-30 Bonds will at all times, before maturity be receivable at Ten Per Cent. Premium (or 1.10), in exchange for the Company's lands at their lowest cash price.

In addition to their absolute safety, these Bonds yield an income larger, we believe, than any other first-class security. Persons holding United States 5-20's can, by converting them into Northern Pacifics, increase their yearly income one-third, and still have a perfectly reliable investment.

HOW TO GET THEM.—Your nearest Bank or Banker will supply these Bonds in any desired amount, and of any needed denomination. Persons wishing to exchange stocks or other bonds for these, can do so with any of our agents, who will allow the highest current price for all Marketable Securities. Those living in localities remote from Banks, may send money, or other bonds, directly to us by express, and we will send back Northern Pacific Bonds at our own risk, and without cost to the investor. For further information, pamphlets, maps, etc., call on or address the undersigned, or any of the Banks or Bankers employed to sell this Loan.

For Sale by

JAY COOKE & CO.,

Philadelphia, New York and Washington, Fiscal Agents Northern Pacific Railroad Company.

By most National Banks, and by Brokers generally throughout the country. ma25-13t-cow

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points :
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

ma4-2tam

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,
San Francisco.

SCIENTIFIC PRESS.

Fig. 1

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Eagle Quicksilver Mining Company—

Location of mines, Eagle Mining District, Santa Barbara County, California.

NOTICE.—There are delinquent upon the shares of the following named persons, on account of assessment levied on the Eighth day of February, 1871, the several amounts set against the names of the respective shareholders, as follows:

Names.	No. of Certif.	No. Shares.	Amount.
Bankley, A. S.	unissued.	1	\$40 00
Kays, J. C.	unissued.	1	40 00
Kays, J.	unissued.	1	40 00
Benton, Dr. H. A.	unissued.	1	20 00
Smith, Alfred.	unissued.	1	20 00

and in accordance with law and the articles of agreement of said mining company, and an order of the Board of Trustees thereof, made on the eighth day of February, 1871, the whole or such undivided part of each of such delinquent shares in said mines as may be necessary to pay said assessment upon each, will be sold to the highest bidder at public auction, for cash, in United States gold and silver coin, at the office of the company, room 6, No. 302 Montgomery street, San Francisco, California, on Monday, the 10th day of April, 1871, at the hour of 2 o'clock P. M. of said day, to pay the said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. H. WATSON, Secretary.

Room 6, 302 Montgomery street, San Francisco. ap8

Mountain City Mining Company—Location

of mine, Cope District, Elko county, State of Nevada.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment levied on the Eighteenth day of February, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Best, John T.	61	400	100 00
Enright, John T.	63	250	62 50
Greek, H. J.	42	100	25 00
Hobron, W. M. C.	28	60	12 50
Hobron, W. M. C.	24	10	2 50
Hobron, W. M. C.	25	10	2 50
Hobron, W. M. C.	26	10	2 50
Read, Francis.	62	400	100 00
Strong, Harvey.	28	125	31 25
Sharp, Wm. H.	67	900	225 00
Titus, H. W.	49	400	100 00

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of January, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the sales-room of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 17th day of April, 1871, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINOARD, Secretary.

Office, 206 Front street, San Francisco. apl-2w

Marble Falls Mining Company.—Location

of Works: Mammoth District, Nye County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of March, 1871, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room No. 4, No. 405 Front street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the first day of May, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 22nd day of May, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. S. N. STYDAM, Secretary.

Office, Room No. 4, No. 405 Front street, San Francisco, California. apl-1w

North America Consolidated Mining Com-

pany—Location of works, White Pine Mining District, County of White Pine, State of Nevada.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment levied on the 15th day of February, A. D. 1871, (also amount due by original owners on rescinded stock) the several amounts set opposite the names of the respective Shareholders as follows:

**THE
[ASPHALTUM PRESSURE PIPE
COMPANY,**

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.

ranted equal to new. Orders from the country promptly
attended to. 9v19-qy

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all
others in several important particu-
lars. The grinding mullers are near
the center, requiring less power.
The plow-shaped grooves raise the
quicksilver with the pulp regularly,
with less power, without violence,
and with better amalgamating ef-
fect, besides admitting of a larger
charge. The inclined-shaped hous-
ings of the muller-plate openings
efficiently force the pulp directly
under the mullers.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,
Where it can be examined and further particulars be learned; or persons may apply to the inventor and pat-
entee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pan have long
been in constant operation. 15v20-1mr, lamtf

**STEAM JET PUMP.
Blaklee & Williams' Patent.—For
Water, Oils, Acids, Etc.**

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit:—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent
of an engine; it will not
choke up with foul water; it
costs much less to put up
and start; it will not wear
out in a lifetime, or require
repairs; it is reliable, and
certain to work at all times;
it is not liable to injury
from freezing.

Satisfaction guaranteed or the money refunded.

streets, San
Francisco.

DESCRIPTION:—D, is a glass chamber which contains
the lubricant. C, is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F, is the discharge
pipe for the lubricant, provided with an inverted siphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E, a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the expan-
sion of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and C. 1618-tf

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.

California Laurel always on hand.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed
in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and pow-
er. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be
run slow or fast, as may be desired. Will discharge more water
than any others of the same dimensions. Has no leaky
joints, the steam part being cast in one entire piece. The steam
valve is perfectly balanced, is cushioned at each end, and
slides with the greatest facility having no cans, nor complex
rotary arrangements to get out of order. Will start at any
point of the stroke, and will discharge all the water of conden-
sation. The Pump has no crank or fly-wheel, thereby saving a
considerable item of expense to the purchaser. Having no dead
points, it therefore needs no watching, and is consequently
ready to start without using a starting bar or any hand work
whatever. The Blake Pump is extensively used on Railroads
and Steamboats; in Hotels; for Mining and Fire purposes; in
Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and
deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and conse-
quently the best Steam Pump ever built. For sale by **BERRY & PLACE,** Machinery Depot, 112 and 114 California st.,
San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

LANE & BODLEY'S

PORTABLE STEAM ENGINES.

From eight to twenty-five horse power, adapted to

A NEW ARTICLE.

Composition Pipe for Conducting Water.

The attention of Railroad Companies, farmers dairy
men and others, is called to our new Pipe for leading
water. It is lighter than ordinary lead pipe, and much
cheaper than iron, will stand a heavy pressure, and de-
liver about one-third more water than iron pipe, provid-
ed the sizes are the same.

We are now manufacturing all sizes, from half-inch to
two-inch, and can fill large orders at short notice and
put on reels for shipment, the same as lead pipe.
Samples can be seen at our office.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE
Ransom Patents, the most perfect SANDSTONE, speci-
mens of which may be seen in the ornamentation of
Dr. Storer's Church, now in course of erection, at the
corner of Post and Mason streets. For architectural,
ornamental and mechanical purposes, this stone sur-
passes all natural stone of its class.

GRINDSTONES from this factory, which we make of
any desired size, may be seen at many of the great
mechanical shops in this city, where they are held in
high esteem.

The factory is now turning out Architectural Stone,
Cemetery Stone, Grindstones, Garden Ornaments, in
the way of Vases, Fountains, etc. The nature of the
art admits of our moulding the stone in any desirable
form, and enables us to compete successfully with all
natural stone wrought by hand. In England, where the
stone has been manufactured largely for the past fifteen
years, it is considered, for durability and strength, to
surpass the best English Sandstone. The British
Government employs it largely in its public buildings,
both at home and in its Colonies; and as we have se-
cured the services of MR. ERNEST L. RANSOM, late
Superintendent of the home works at Greenwich, Eng-
land, we are turning out stone fully equal to the English
standard.

For particulars, apply at the Factory, corner Turk and
Larkin streets. mal8-1f

DEWEY & CO.,
American and Foreign Patent
Agents, Publishers of
the Scientific Press,
San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Improvements in Railroad Construction.

With the multiplication of railroads on our coast, the subject of preventing accidents increases in importance. While we have been heretofore quite fortunate in the actual number of losses, yet we hear every now and then of something of the kind. When we compare the number of passengers carried and the number of miles traversed with the number of accidents, we find that railroad traveling is by no means to be called dangerous. Yet once in a while a disaster does occur, which, by its suddenness, and, perhaps, magnitude, seems particularly terrible.

The liability to such accidents, whether they actually occur or not, demands that railroad companies should adopt every improvement which tends to safety, and their interests also require that they should by proper devices guard against loss of property.

Our attention has been called to the fact that the California Pacific Railroad has in use a large number of what are called Miller's trussed platforms, compression buffers and automatic couplers. These have been proved by tests on various roads to have acted efficiently in preventing loss of life and property. We give illustrations of this excellent device which seems to us to be almost a requisite for a really good road.

Fig. 1 is an elevation; Fig. 2, a longitudinal section; Fig. 3, a plan of an end of a car to which the arrangement has been applied. The letters refer to the same parts in all the figures. A is the coupling hook; B the buffer; C the stop; D the lever; F the truss beam; G the spring beam; H the suspender beam; I the upward trusses; K the main spring; L the downward trusses; and M the bolster.

The platforms, instead of being located below the centre line of the main sills of the cars, are placed in that line, and held there by the trusses, I and L so that the point of contact (in buffers, B) is in the said centre, and not below it. The coupling hook, A, is attached to the draw spring the same as the ordinary draw head, and at the same height above the track, but in such a manner that the outer end is free to move laterally for a short distance. The coupling hook projects beyond the platform. The stop, C, is placed under the buffer beam to prevent accidental uncoupling. When two cars are brought together, the coupling hooks, from their shape, push each other aside, until the buffers, B, are compressed hard on the buffer springs, then—the points of the hooks having passed each other sufficiently far—the hooks are carried forward by their main springs, and thus the coupling and compression are both effected automatically and at the same time, and without the use of links and pins.

When two cars are thus coupled together, the head of the hook of each car is under the buffer beam of its opposite car, and the platforms are close together (about four inches apart). The effect of this is, one platform cannot be forced over the other, nor can a person fall between the platforms; the dust and rain are nearly all shut out; the compression makes the train run steadily, and prevents all jerking at starting and stopping.

It is said that telescoping and oscillation make up three-fourths of the sum of all railroad accidents, the latter greatly predominating. This construction is affirmed by many railroad engineers to prevent these. It also, however, obviates the liability to many other dangers, as falling between the cars, being crushed when coupling, etc. The testimony in its favor is certainly very great. It is asserted that

MILLER'S TRUSSED PLATFORMS, COMPRESSION BUFFERS AND AUTOMATIC COUPLERS.

its present use saves at least an average of one life a month, even one every week, to say nothing of the amount of property.

Of our western roads, the California Pacific, the Union Pacific and the Utah Central have adopted the arrangement. We believe that it has not yet been introduced on the Central Pacific, but as the management is alive to the interests and advances of the present, and as one of the prominent officers of the road has spoken very favorably of it, we may hope that it will be in use on this road also before long.

ARRIVAL OF SILKWORM EGGS FROM JAPAN. The silkworm eggs, which we mentioned two weeks since as en route to this city from Japan, have arrived. They consist of 135,000 cards, costing in Japan \$675,000. The eggs were contracted for in Japan by a French house, at five dollars per card. Through the embarrassment of the war in France, the house was compelled to cancel all orders by telegraph, and could not meet engagements already executed. The Japanese merchants, eleven in number, on whose hands the eggs were left, immediately purchased a vessel with which they have arrived at this port in personal charge of their property. The eggs are reported to be fresh and in prime condition.

State Geological Surveys.

We learn, through the columns of a valued cotemporary, the *U. S. Min. and R. R. Register*, of two facts concerning State geological surveys, which are illustrative of what we should call practical sense and of profound stupidity. We incorporate the matter furnished by the paper alluded to into the following article.

One fact, which illustrates the fanatic stupidity, is the action of the Senate of West Virginia with regard to the State geological survey. A bill instituting the survey had passed the House, but failed in the Senate,—not on the grounds of practicability or impracticability, of expense or usefulness; but because of the opposition of several profound theologians and senators who declared that Geology was opposed to Religion. A friend suggests that

mineralogical geologist of the country, now the chief of the California survey, Prof. J. D. Whitney, of Harvard College," was his assistant. "It is remarkable that the young State of Iowa should thus have been able to secure the two foremost men in the science together on its survey." The war trouble stopped the work, which was resumed, however, in 1866, under charge of Dr. C. A. White. "The natural increase of population" adds the paper alluded to, "taking up into cultivation always new land and opening fresh treasures hid in the earth, sufficiently explains the fact that none of the United States which has had a geological survey made once, fails to order a second or a third; and it is as certain as that the sun will continue to shine, that every State government will in time embrace as a necessary, integral and perpetual feature of its existence, a standing directorship of mineral surveys, and a bureau of physical and commercial statistics."

IRRIGATION DITCHES.

The Calaveras and San Joaquin Water Company, lately incorporated, propose building a canal, 8 feet deep, 40 feet wide at the top, and 30 feet wide at the bottom from the Mokelumne river, near Camanche, to Bear creek, San Joaquin county, thence to the Calaveras river, and thence to Stockton. It is claimed that the canal will irrigate at least 350,000 acres of land.

The Merced Irrigation Canal is being constructed by Wm. G. Collier & Co., work having been commenced in February.

This is to be 50 feet wide, with a fall of one foot to the mile, and to extend from mouth of the Merced river to Bear creek, the near the Lone Willow, (where the latter stream will be dammed) to Farn's creek. From a point high up on this creek a canal will be cut along the hillside to a point about five miles above Snelling, to the Merced.

The San Geronio Canal Company, of San Bernardino county, has lately been incorporated. It proposes to divert and distribute the water flowing into San Geronio Pass.

The Mormon Slough Canal and Irrigation Company has been incorporated at Stockton.

PATENT EGG CASES.—Persons who ship or handle eggs in large quantities, will find it to their advantage to make use of Steven Bros.' Patent Egg Cases. These cases hold about 30 dozen eggs each, which are self-counting, (so that no mistake can be made) while they can be packed with the greatest ease and facility. Eggs shipped in these cases sell more readily; and are less subject to damage from being broken. No packing material is required. This is a California invention, and was patented through the SCIENTIFIC PRESS AGENCY, February 26th, 1867. The cases sell by the quantity at from \$3 to \$3.50 each. Parties desiring further information, should apply to the proprietors, as above, at the Union Market, on Howard street, in this city.

MECHANICAL PROGRESS.

PURITY OF MELTED METALS DETERMINED BY THEIR DROPS.—Dr. Quincke, of Berlin, has described,—says the *Polytechnische Journal*,—a new method of determining the purity of melted metals, and of various chemical combinations by the height of the drops which are formed by them upon a horizontal surface. By the height of a drop, such as is formed by dew upon a leaf or by quicksilver upon glass, is meant the vertical distance of the horizontal plane from the vertex of the drop surface. This altitude is nearly constant, and is independent of the diameter of the drop if it is not greater than 20 millim. * * * The altitude of large flat drops or bubbles is less if their surface is covered with a thin coat of some fluid. A fluid coat less than the millionth of a millimetre in thickness is sufficient to reduce the altitude of melted drops in a sensible degree. A maximum of depression ($\frac{1}{4}$) occurs when the coat is 50-1,000,000 of a millimetre in thickness, which is about 1-10 of the length of a light wave. The presence of very small quantities of substances may be proved in this way to a degree of delicacy unequalled by any other method of observation except that of the spectroscope. A trace of oil on a drop of dew or a bubble of air in water, and a trace of lead applied to a drop of melted silver, reduced the height from 4 to 2.8 millimetres, so that unpractised eyes could easily discern the difference. Substances which oxidize easily in the air should be melted and tried in some indifferent gas, like carbonic acid gas. Large flat drops of iron from several mills, with surfaces coated with oxide, all had the same altitude of 5.2 millimetres. Workmen in foundries are in the habit of judging the quality of cast-iron by the form and condition of the drops. The speaker thought the careful investigation of the forms and altitudes of melted drops might prove an important aid in determining the properties of metals.

PROGRESS IN STEAM ENGINEERING.—From an editorial in London *Engineering* for March 3d, we clip the following:—"On land and sea the purchase cost of a steam horse power has increased during the past twenty years from 20 to 30 per cent., the pressure has increased 50 to 500 per cent., while the weight of fuel per each horse-power has been reduced from 7 lb. to $2\frac{1}{4}$ lb., and if we take the past ten years only, a pound of coal now develops twice the power it did in 1861. Successful steam engineering does not mean merely the production of an engine economical in working, but the production of one at a cost that shall be remunerative to the purchaser. That the improvement previously named is of this character in marine engineering is easily proved. In 1861, marine engines of 400 indicated horse-power could be purchased in the north for 3,500l., requiring $4\frac{1}{2}$ lb. of coal per each horse-power; in 1871, the same power can be purchased for 4,500l., requiring $2\frac{1}{4}$ lb. of coal for each horse power. Such engines would average at least 200 days' steaming each year, and allowing 20s. per ton for the coal saved and additional cargo—a very low estimate—the owner will receive nearly 2,000l., or 200 per cent. on his extra purchase outlay of 1,000l., while assuming the value of the 1861 ship and engines to be 16,000l., and those of 1871 to be 17,000l., and the first ship just cleared her expenses, the saving in fuel alone would give a dividend of nearly 12 per cent. on the capital of the second and higher-priced ship. This great reduction of fuel, and the certainty that a large margin is left for further saving, gives a most encouraging prospect for the future of steam navigation."

HIGH SPEED COMPOUND ENGINE.—*The Engineer* illustrates a three-cylinder compound engine invented by A. F. Franklin. We quote from the description: "In order to avoid the inconvenience and 'knocking' attending the running of double-acting high-speed steam engines due to the sudden reversal of the strain on the crank pin at each stroke, Mr. Franklin uses three single-acting cylinders with cranks set at 120 deg. The connecting rods being fixed directly on to the pistons, the height of the engine is reduced to the lowest possible limit, a point of much importance in marine engines with overhead cylinders. The eccentric and valve gear is simplified. The course of the steam will be readily traced. When it has done its work it exhausts from the last and largest cylinder into a

condenser; this piston, and this only, using the pressure of the atmosphere as motive power. In order to avoid the evil of excessive cylinder condensation, common hitherto to all single-acting engines, the cylinders are jacketed, and the pistons are provided with trunks, consisting of thin cylinders of steel, lagged with wood inside. These cylinders may be regarded as practically non-conducting, as their weight is too small to enable them to condense much steam, while the quantity of air which can find its way between their sides and those of the cylinders, is too small to have any appreciable cooling effect. It is clear, therefore, that the temperature of the metal of the cylinders will be maintained very nearly as well as though the engines were double-acting."

NEW FEEDING MACHINE FOR PRINTING PRESSES.—*The Tribune* describes a recent invention in which a single sheet from the pile of paper is sucked up at each upward movement of the oscillating table upon which it is placed. An oscillating pipe, furnished with short tubes, or caps, having oblique edges, is exhausted of air at each movement, by means of an air pump attached to the machine,—thus supplying the suction apparatus. A second tube is placed parallel with the oscillating pipe, and is provided with several perforations opposite the table, from which currents of air pass underneath the raised sheet of paper and separate it from the other sheets lying on the table. At this instant the suction of the pipe ceases by the action of a cock cutting off the communication with the vacuum-chamber, and the paper is released from the cups and delivered to the adjusting apparatus. The latter consists of a series of grippers and clamps by which the sheets are adjusted and delivered to the printing-press without manual assistance. The sheet is seized by traveling carriers moving horizontally, and if oblique, or out of place on the back table, the front edge is drawn squarely up to the gauges by means of guides, while at the same time side-clamps, acting at right angles to the carriers, seize the lateral edge of the sheet and adjust it according to side-gauges. The apparatus is not only adapted to printing-presses, but may be used in connection with rolling, folding, cutting, and all other machines which are fed with paper. Its speed is 2,500 sheets an hour.

BESSEMER STEEL CAST GUN BARRELS.—*The London Mining Journal* says Mr. Foster, of Sheffield, has had rifle barrels cast from a hollow bloom. They are cast with a chill centre, and then rolled into the centre instead of being drilled, so preserving the original skin of the metal. By being case-hardened they wear longer without fouling, are not liable to corrosion, whilst the cost is scarcely so much as the ordinary barrel. Mr. Foster has just had a Chassepot barrel cast, and it appeared to be all that could be desired. The invention is applicable to steel hoops for railway wheels, gun barrels, and the casting of cylindrical forms in Bessemer or crucible steel. The object of the improvement is to save the preliminary processes in the production of a "bloom" by casting it in a metal mould, with a movable metal pin centre.

LOCOMOTIVE FEED-WATER HEATER.—*The Springfield Republican* thus describes an arrangement now being tested on the Connecticut River Railroad, for the saving of fuel by utilizing the waste heat:—"The water is pumped from the tank in the tender through a copper pipe, $1\frac{1}{2}$ inch in diameter, to the 'heater,' which is a coil of pipe of the same size around the 'cone-pipe' in the smoke-stack, and from this coil the water, heated to more than 200 degrees Fahrenheit during its passage through the coil, passes in a copper pipe on the side of the boiler opposite its passage when cold, and into the boiler."

SIZE AND SPEED OF BELT FOR ONE-HORSE POWER.—"It is found practically, that a leather belt eight inches wide, embracing half the circumference of a smoothly-turned iron pulley, and traveling at the rate of 100 feet per minute, can communicate one-horse power."—*Jour. Frank. Institute*.

SHEET TANITE.—Such is the name of a new article intended as a substitute for vulcanite, about to be brought before the public by the Tanite Company of Stroudsburg, Pennsylvania.

SCIENTIFIC PROGRESS.

PARTHENOGENESIS.—A. S. Packard reviews, in the *American Naturalist* for March, a work by Prof. Ganin on the early stages of Ichneumon parasites, and at the conclusion says he cannot refrain from making some reflections suggested by the remarkable discoveries of Ganin. We quote:—"In the first place, these facts bear strongly on Cope and Hyatt's theory of evolution by 'acceleration and retardation.' In the history of these early larval stages we see a remarkable acceleration, or hurrying up, of the embryo. A simple sac of unorganized cells, with a half-made intestine, so to speak, is hatched, and made to do the duty of an ordinary, quite highly organized larva. Even the formation of the 'primitive band,' usually the first indication of the organization of the germ, is postponed to a comparatively late period in larval life. The different anatomical systems, the heart, with its vessels, the nervous system, and the respiratory system (tracheæ), appear at longer or shorter intervals, while in one genus, the tracheæ are not developed at all. Thus some portions of the animal are accelerated in their development more than others, while others are retarded, and in others still certain organs are not developed at all. Meanwhile all live in a fluid medium, with much the same habits, and surrounded with quite similar physical conditions. The highest degree of acceleration is in the reproductive organs of the Cecidomyian larva of Miastor, which produces a summer brood of young, alive, and which live free in the body of the child-parent; and in the pupa of Chironomus, which has been recently shown by Von Grimm, a fellow countryman of Ganin, to produce young in the spring, while the adult fly lays eggs in the autumn in the usual manner. This is in fact a true virgin reproduction, and directly comparable to the alternation of generations observed in the jelly fishes, in Salpa, and certain intestinal worms. We can now, in the light of the researches of Ganin, Siebold, Leuckart, and others, trace more closely than ever the connection between simple growth and metamorphosis and metamorphosis and parthenogenesis, and perceive that they are but the terms of a single series. By the acceleration of a single set of organs (the reproductive), no more wonderful than the acceleration and retardation of the other systems of organs, so clearly pointed out in the embryos of Platygaster and its allies, we see how parthenogenesis under certain conditions may result. The barren Platygaster larva, the fertile Cecidomyia larva, the fertile Aphis larva, the fertile Chironomus pupa, the fertile hydroid polyp, and the fertile adult queen bee, are simply animals in different degrees of organization, and with reproductive systems differing not in quality, but in the greater or less rapidity of their development as compared with the rest of the body."

PROGRESS OF THE CALIFORNIA GEOLOGICAL SURVEY.—Some two months since, we noted the issue of the first volume of the Ornithology, containing the land birds of the western side of the continent. *Silliman's Journal* for April has the following:—"The second volume of Ornithology, which will contain the water-birds of the whole country, is in process of preparation. The volume of Conchology, which Dr. Carpenter undertakes, is likewise begun; and Prof. Brewer of Yale, formerly assistant on the survey, is rapidly working up the botanical material for publication, aided by Prof. Gray, and by others specially qualified for the work. The abundant collection of mammalian fossils is committed to Dr. Leidy for treatment. The fossil botany is undertaken by Prof. Lesquereux. The volumes already issued contain descriptions and figures of the invertebrate fossils by Mr. F. B. Meek and Mr. W. M. Gabb. It thus appears that Prof. Whitney has called to his aid the best available talent in working out the results of the survey in special departments. Meantime, the field-work, and the elaboration of the geological and topographical data collected, are going on rapidly under his direction. * * * Of the maps of the California survey, there have appeared hitherto those of the Yosemite valley and of the High Sierra in its vicinity (in the Yosemite Guide Book), and that of the region adjacent to the Bay of San Francisco, the last on a scale of two miles to the inch; a much larger map, including about 60,000 square miles of the central part of the

State (occupied by more than nine-tenths of its population), is far advanced, one of its four sheets (the S. W. corner) being already engraved, and a second (the S. E. one, containing the highest part of the Sierra) in the engravers' hands. This is on a scale of six miles to the inch; it will be issued in duplicate, as geological and as a topographical map. Another, of the whole State, at eighteen miles to the inch, is finished, and is intended to serve as a preliminary geological map, and to accompany the second volume of geology, of which the printing will be begun next summer. Among the regions which have been recently receiving particular attention is that of the ancient river-channels, on the western slopes of the Sierra, which a party has for a long time been engaged in exploring and mapping, and on which a full report is soon to be made; also, the White and Inyo ranges of mountains, east of the Sierra and of Owen's valley; and the vicinity of Clear Lake, in the northern coast ranges."

FUNGOID ORIGIN OF CHOLERA DOUBTFUL.—The report of Dr. T. R. Lewis in, reference to the cholera inquiry now proceeding in India under direction of the Army Sanitary Commission, is noticed in *Nature* for March 16th. The investigation has so far been limited to facts bearing upon the theories of Hallier and Pettenkofer. The former held that cholera was due to the introduction of a fungus resembling the rye fungus of Europe, and probably present in diseased rice in India. "The general conclusions of Dr. Lewis upon this portion of the inquiry are:—1. That no cysts exist in choleraic discharges which are not found under other conditions. 2. That cysts or 'sporangia' of fungi are very rarely found under any circumstances in alvine discharges. 3. That no special fungus has been developed in cholera discharges, the fungus described by Hallier being certainly not confined to such. 4. That there are no animalcular developments, either as to nature or proportionate amount peculiar to cholera, and that the same organisms may be developed in nitrogenous material even outside the body. Lastly, that the supposed debris of intestinal epithelium is not of this origin, but appears to result from effused blood plasma. Unless these conclusions are materially modified on subsequent inquiry, they must be considered as disposing of Hallier's theory of cholera. Should, however, Dr. Lewis's further investigations prove that Hallier's fungus is present in choleraic discharges and in diseased rice as a constant, we should still require scientific proof that cholera was caused by the action of this fungus and by nothing else."

ELECTRIC DISCHARGES THROUGH GASEOUS MEDIA.—At the Royal Society's *soirée*, March 11th, Mr. C. F. Varley exhibited an experiment in illustration of a paper read by him in January:—"In a Geissler's tube, containing highly rarefied hydrogen, a small filament of talc was hung by a single horizontal fibre of silk. Two aluminium rings, separated an inch and a quarter, formed the electrodes inside the vacuum. This tube was placed longitudinally with and over the horizontal poles of a large and very powerful iron horse-shoe electro-magnet, made of a bar four inches in diameter and four feet in length, and wrapped with nearly 2 cwt. of thick copper wire. A small induction coil sent electric discharges from one ring to the other, producing a brilliant blue light around the negative pole, the positive pole being dark. The moment the magnet was charged, by means of thirty cells of Grove's nitric acid battery, each cell containing twenty square inches of platinum foil, the electric luminosity in the tube, which beforehand was diffused, gathered up into an arch extending one and a half inches beyond each ring, forming altogether a well-defined arch about four inches in length. This luminous arch follows exactly the course of those magnetic rays which traverse through the negative pole. By shifting the tube the piece of talc can be brought at pleasure in or out of this luminous arch. Neither the electric action nor the magnet *per se* produces any motion upon the talc; but when the tube is so placed that the luminous arch strikes against the talc, the talc is repelled as much as 30° from the perpendicular. The electric current is passing simply from one ring to the other inside the tube, but the luminous arch in question where it strikes the talc is on the other side of the ring and where no electricity is flowing."

CORRESPONDENCE.

The San Diego Mines.

[Written for the Press.]

EDS. PRESS:—As I frequently see statements in the Press and other newspapers, headed "good return," "rich yield," stating that mines in certain localities in this State are yielding from five to fifteen and thirty dollars per ton, and in one instance the extraordinary yield of seventy-four dollars per ton, I thought I would write you a few facts with regard to our mines in this region, as it seems very little is said, or known, about the richness of our ledges in this far-off country. This, I presume, is attributable to the fact that no capitalist has invested one dollar in the district, and no stock operator or member of the Board of Brokers has any interest here; and whatever we have or can show, has been developed by men prospecting and mining without any means except their hands to open and develop their claims. And yet I believe we can defy competition by any mining district on the coast at the present time or any time within the last ten years, for the number of good claims and rich yield of ore.

Julian District Mines—Working Results.

I will give you a statement of the working of a few of our prominent ledges. The Owens Co. have taken out and worked 400 tons of ore, in different lots, the lowest return being \$19 per ton and the largest \$53 per ton, averaging over \$30; the rich specimen ore, worked in hand mortars, is not taken into account. They are down on the vein 80 feet, and have a good, well-defined ledge two feet in width. The Hayden Co. have worked about 300 tons of ore that has averaged over \$40 per ton, one lot going as low as \$11, while all the rest returned over \$30, and from that up to \$50. A great deal of the best ore worked in hand mortars is not taken into this account. The mine is looking well. The Washington Co. have had nearly 100 tons worked, and averaged over \$40 per ton; lowest return \$12, and highest \$117.50. The Van West Co., has worked 150 tons averaging over \$30. The California Co. have had 250 tons worked, which averaged \$15.37½. This includes about 40 tons of dirt sent to the mill and worked by mistake, which returned about \$2.50 per ton. One lot worked from this mine returned \$58 per ton. The shaft is down 70 feet on the ledge, which, at the bottom, is from one to three feet wide and shows free gold.

The Helvetia mine has had 450 tons of ore worked, the highest run being \$57 per ton, and the lowest \$11, and has 50 tons of ore on the dump. The ledge is one of the best defined in the district and has a shaft down 70 feet. It will average from two to three feet in width, with a splendid showing of ore. The Eagle ledge is also well defined, showing a good width, and prospects as well as any ledge in the country; in fact there are few that prospect as well; but it is lying idle for the want of capital, most of the owners having gone off to work until they can get money ahead to open their claim. The Great Eastern is another ledge that has a shaft on it about fifty feet deep. Two lots of ore have been crushed which averaged \$23 per ton. The ledge has now become quite narrow, but the rock is exceedingly rich, showing free gold throughout. Some of it is estimated to contain one dollar per pound. A contract has been let for taking out 100 tons of ore.

Banner District Mines.

The ledges in San Felipe Cañon, Banner District, however, surpass everything in the way of rich yields. The Chapparel Co. have worked in an arastra 14 tons, which averaged over \$85 per ton. McKean's mine has yielded about 40 tons, at an average of over \$50. The Antelope, or Pat O'Day Co. have been working about 500 pounds of ore per day in their arastra for nearly two months, which has returned them regularly an average of \$100 per day. Two of the owners are now in San Francisco purchasing a mill to work on their ledges. The Madden Co. have just made a clean up of 25 tons of ore, which averaged \$74 per ton.

The Kentucky, *alias* Lady's Leg claim are now having ore worked in McMechan's Mill, some of which is literally filled with gold, from a ledge three feet wide. The Atlantic Cable has had one lot of 13 tons worked, averaging over \$50 per ton. The Redmann ledge and claim has had about 100 tons of ore crushed, returning over \$25 per ton, in McMechan's mills, from which about 25 tons of the richest had been

selected and worked in an arastra, paying about \$75 per ton. This ledge is the first discovered in San Felipe, and shows the largest deposit of ore in the cañon. The Bailey claim on the end of the Redmann ledge is opening finely. They now have a showing of ore eight or ten feet wide, much of it showing free gold. They are now hauling ore to McMechan's mill for crushing. McMechan has purchased one-half (500 feet) of the Redmann claim, and has a fine prospect of keeping his mill running constantly on his own ore. The Blueledge has not had much work done on it yet, except pounding a little of the ore in hand mortars, and is rich in free gold.

New Discoveries.

Much excitement has lately been created here by a discovery called the King Discovery, made about three or four miles south of the Redmann claim. It is extraordinarily rich, there being many tons of specimen ore lying around loose on top of the ground. It consists of three ledges. The upper one is next to a bastard or shelly granite; the middle has a stratum of porphyry along the lower side; and the lower and smallest is in slate, and is the richest of all. Nearly the whole ledge shows free gold, and a portion of the vein is of a decomposed, soft, chalky consistence and pulverizes very easily, in fact, a large portion of it can be pulverized by the pressure of the hand. I took some specimens from the ledge, a day or two ago, to send you, as it is a singular deposit and I would like to have your opinion of it. I will send it by the first opportunity, (as we have no express running here now, Wells, Fargo & Co. having drawn off,) properly labeled. These ledges will no doubt all come together a few feet beneath the surface. The largest ledge (about two feet wide) prospects in free gold splendidly. They have also found the extension South rich at the depth of ten feet.

Two men came here, one week ago, with three sacks of ore, and left a small sample at one of our stores, which contains a good proportion of gold mixed through the entire mass. They could not be induced to tell where their ledge was, saying they were not ready yet, but it is supposed to be still south of the King ledge.

Extent of Mines—Prospects.

All of our richest mines are on the same belt, extending south, from this place, doubtless to the rich mines at San Rafael, Lower California, as old settlers say that for many years gold was known to exist on this belt, all the way down, to Lower California, but no prospecting has ever been done until after this district was discovered. Here is a wide field for the California pioneer miner to prospect in, with more natural advantages than any country I have ever seen, for working mines—wood, water, etc., being abundant in this (Julian District) and San Felipe, and, in fact, for a long distance south.

We hope since the passage of the Southern Pacific R. R. bill, which road will pass within 30 miles of us, and the San Francisco branch within ten miles, that some of the large operators in mines and mining stocks will come to this district and see for themselves; and if any mining district in the State can show a better, or as good, a record as Julian and Banner districts of San Diego county, we would like to hear from them.

The dullness of the mining interests here is attributable to the fact of the Cuymacca grant owners attempting to survey us into their limits, but late decisions of the U. S. Land Commissioner and advice of our attorney, give us reason to believe that the decision will be made in our favor within one month. San Felipe or Banner District is free from grant swindles.

There are many other items of interest that I would like to mention, but I have already monopolized too much of the space in your valuable paper and will therefore close.

Julian City, Mar. 23, 1871.

Notes of Travel in Amador County.

[Written for the Press.]

Amador and Summit Mines.

The Amador Co.'s works are situated in the suburbs of Sutter Creek. The stock of the company is principally held in San Francisco, and Michael Reese and M. S. Latham are the heaviest owners. The company claim 1,800 feet on the ledge. They have two sets of hoisting works, each of which is run by an engine of 80-horse power. The upper (or old shaft,) is down 1,250 feet, on an incline of 71°; at that depth the ledge is 8 feet thick. Their new shaft, now in course of construction, is

down 950 feet on the same incline as the old shaft, and built in three compartments. From its appearance, it is the most substantial shaft in the vicinity. The following are the present officers of the company: M. S. Latham, (President;) David D. Colton, (Vice-President;) M. Reese, (Treasurer;) L. Schumacher, (Secretary;) John A. Steinberger, (Superintendent;) M. S. Latham, A. Goldsmith, D. D. Colton, M. Reese and David Fay are the Trustees.

The company own three quartz mills; one of 40 stamps, run by steam engine of 75-horse power; the other two of 16 stamps each, run by water power, and at present rented to outside parties. The 40 stamp mill is run by the company, and crushes daily (24 hours), 80 tons of rock; 100 men are regularly employed.

This company mined 32,294 tons of rock for the 15 months ending January 1st, 1869, which averaged \$21.56 per ton. Their net dividends for that year amounted to \$340,400. For the year ending December 31st, 1869, 32,510 tons were crushed, paying its stockholders a net dividend of \$384,800; for the year ending January 4th, 1871, the stockholders received \$111,000 in dividends.

The Summit mine (south extension of the Amador), near Sutter Creek, is owned by Hall McAllister & Co., of San Francisco, and superintended by A. Tibbits, Esq. This claim is 1,400 feet in length, and has a fine hoisting works run by an engine of 45-horse power. Two shafts are sunk within 110 feet of each other; one is down 300, and the other 500 feet, on an incline of 45°. This mine was first struck in 1869, and from a chimney down 165 feet, some \$30,000 were taken out. At that time the ore run from \$16 to \$32 per ton. It is now only being kept dry, awaiting the coming in of the Big Ditch (spoken of in my last), so that the works can be run at a less expense. The object will be accomplished by July 1st, 1871.

Maxwell Mine—Chlorine Works.

The Maxwell mine, situated close by the above mentioned, is owned by an incorporated company. Gen. D. D. Colton, of San Francisco, is President; Capt. George Wallace, Secretary, and D. T. Davies, Superintendent. This claim runs north and south, and is 2,000 feet long. The hoisting works are run by an engine of 20-horse power, over a shaft down 750 feet, on an incline of 75°. At that point a cross-cut, of 70 feet reveals a ledge 9 feet thick; they get out from 45 to 50 tons per day, and are working 25 men. The rock is crushed at the Badger and Rose mills, the two 16-stamp mills mentioned above, which they rent of the Amador Co., which are situated one mile distant. This rock is low grade ore, averaging from \$5 to \$6 per ton, but is easily mined and crushed.

Breadlove & Tarr's chlorine works, situated one-half mile north of Sutter Creek, are very complete in every particular, and cost some \$3,000 to erect. The furnaces (three in number) are situated one above the other, like steps. The upper one first receives the sulphurets (after they have been separated from all other foreign matter) for drying; the next below this, receive and thoroughly roasts them. In the third or lower one, the sulphurets then receive the amount of heat that, in the judgment of the operator, is necessary. In this last furnace, a heat sufficient to melt any kind of ore can be produced. After this the ore is put into the leaching tubs, and subjected to the action of chlorine gas introduced from the bottom of the tubs. The time for this portion of the process to work depends entirely on the quantity and quality of the sulphurets. The metal is dissolved in this tub by the gases, and from there is run off into the settling tubs, thence to the retorts. The capacity of the works is 2½ to 3 tons daily; the charge is \$20 per ton.

Messrs. Belden & Jones are the possessors of the same kind of works, of similar capacity, situated three-quarters of a mile up Sutter Creek, from the village.

LUMBER.—Geo. Allen, Esq., of Sutter Creek, furnishes (or disposes of) 1,000,000 feet of lumber annually to the inhabitants.

Inventions.

Messrs. Wildman & Marble, of Sutter Creek, are the general agents of the Pacific coast for Wolf's Patent Wood Horse Collar, a few of which I saw in use. They claimed for it that it was very convenient, haims and collar being both in one, and there being only one fastening instead of three. Once fitted to the horse, it will not make the shoulders sore, nor will it change its position; while it will last five times as long as the common kind.

The "Mystic Protector" is a very ingenious contrivance for protecting the vital parts of a watch in case of accident by fall-

ing or violent concussion. By no possible means can the pivots, jewels or ruby-pin be broken (without demolishing the entire watch) by falling, with the above protector attached. Geo. Ramsey, of Clyde, Ohio, is the inventor, and H. T. Barnum the agent for the Pacific coast.

Medeon and Keystone.

The Medeon mine, situated midway between Sutter Creek and Amador City, is owned and superintended by L. R. Ponndstone; hoisting works are erected upon the same, and run by horse power. This mine was worked as early as 1857, and paid, as far as worked at that time, about \$30 per ton. Since that time it has been idle until now. Six men are at present employed sinking a new shaft, which is now down 75 feet. At this point they have found a ledge four feet thick, and still increasing, the prospects of which are quite favorable.

The Keystone mine is situated at Amador City. The stock is principally held in San Francisco. James M. McDonald, of S. F., is President, and S. Moore, Esq., Superintendent. The Co. claim 3,000 feet of a ledge; their improvements consist of two sets of hoisting works and a mill; the latter, containing 40 stamps, is run by an engine of 125-horse power. The hoisting works are also run by steam—one by an engine of 20 and one by one of 80-horse power. They have two principal shafts sunk upon the ledge. The north shaft is down 346 feet, on an angle of 30°, and the south shaft is down 500 feet on the same angle. Four hundred feet down, the vein runs from ten to 30 feet thick. They regularly employ 100 men, and crush daily (24 hours) 80 tons of rock, which, for the past year, has averaged \$16 per ton.

Orig. Amador—Fiddletown—Ditch.

Original Amador. This mine is situated in the suburbs of Amador City, and is owned by J. A. Faull & Co., (a joint-stock association). J. A. Faull is Superintendent. They claim 1,200 feet of ledge; have a fine set of hoisting works run by a steam engine of 25-horse power. A shaft is sunk 360 feet; at that point a ledge 3½ feet thick is found. Twenty-one men are regularly employed, getting out from 10 to 15 tons of rock daily. They are not crushing at present but are preparing to erect a mill of their own. The rock is said to average \$30 per ton.

Fiddletown, distant from Drytown ten miles, contains about 300 inhabitants and is very improperly named—there not being a musical instrument in the place. This town is the only one I recollect of now that has passed through a series of 18 years without a fire. Purinton's ditch (formerly known as the Consummes), which furnishes this district with water, receives its supply from the South Fork of the Consummes river 22 miles from its destination. Its capacity is 1,000 inches. Thirty miles of distributing ditches are connected with the same. This ditch was begun in 1853 and finished in 1856, and cost \$100,000 to construct. It is still a good piece of property for its proprietor (Mr. C. A. Purinton), although this district does not contain over one-third as many inhabitants now as it did five years ago. L. F. MC.

Crystallized Carburets.

[Written for the Press.]

EDS. PRESS:—Many years ago I read in a reliable German paper an article explaining the way to obtain crystallized carburets. Not having had the opportunity of trying it myself, I give you the particulars for the benefit of those readers of your valuable paper who may wish to try it.

If the sulpho-cyanides of iron, copper, lead, zinc, bismuth, silver, tin or manganese, are heated in a closed vessel, nitrogen and sulphurets of carbon will escape, and the residue will be a simple carburet. If the cyanides of the above metals are treated in the same way, only nitrogen escapes, and the residue consists of a carburet with two equivalents of carbon. These carburets form a fine, dark powder, which is very combustible, but is neither fusible nor soluble in water.

But if you wish to obtain them in a crystallized shape, place the above cyanides or sulpho-cyanides, after having dried them completely, in a glass tube (whose extremity has to be bent at a right angle) and heat them on a small sand bath, until the temperature required for its decomposition is reached. At the first sign of decomposition, diminish the fire, and keep only a gentle heat, until the decomposition is completed. After this treatment the carburets will not appear as dark powders, but as brilliant, transparent and colorless octahedrons, which optically resemble diamonds and also cut glass. E. PRIQUE.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, April 1st: Globe on Monday next will be running in good shape. The ore coming out is said to be fair grade and easily crushed and concentrated.... Mt. Bullion tunnel, now in over 1,800 feet, is passing through a porphyry containing iron pyrites.

TARSHISH.—The two leading mines of the lode are carrying on a smart rivalry as to which shall show the richest ore. The Schenectady and Monitor No. 3, are nip and tuck.

ITEMS.—*Chronicle*, April 1st: We learn that a body of good ore has been struck in the Alpine tunnel. The work is progressing satisfactorily.

AMADOR COUNTY.

ITEMS.—*Ledger*, April 8th: On Saturday, the Marklee mine after a run of twenty days with twelve stamps, cleaned up thirteen thousand dollars' worth of amalgam.

NEW DRIFT.—The Kennedey Co. have commenced the survey of a ditch from their mill to Sutter Creek, where water will be procured for the Amador Canal Co. The Kennedy mill, which has been lying idle for a long time, may now commence crushing again in four or five weeks.

CALAVERAS COUNTY.

MINING JOBS.—*Chronicle*, April 8th: Mullen & Co., near Worth's hill, who recently struck gravel through a 1,100-foot tunnel find that they will have to sink a shaft thirty feet to reach the bottom of the channel. Water is troublesome.... Paul & Co., near the Junction, are employing twenty to thirty hands and doing tolerably well. Their tunnel is nearly three thousand feet in length. The lead is wide and the gravel easily mined.... Colby, Currier & Co., in Old Woman's Gulch, are getting their hydraulic in shape.... Nothing done at the What Cheer mine. Work will be resumed as soon as timber can be procured.

....The Hughes Bros., below, have been obliged to suspend operations on account of water.... Shaw, of Chili Gulch, has cut Stockton ridge nearly in two, and shows no signs of letting up.... Brackett & Co., on the opposite side of the gulch are again working regularly. The lead is very crooked, and difficult to trace. The gravel is rich, however.... We understand that the parties working the old Calaveras Tunnel claim are doing well.... The French Co. that purchased the old Paul claim is reported making money.... The Union Shaft Co. have again been compelled to shift their quarters, sink a new shaft and are now bailing out the water. Corral Flat, in which the Co. is working, is perforated with shafts filled with water, a number of which will have to be drained before the bedrock can be reached.... Megaw & Co., on the west side of Stockton ridge, are running their main tunnel ahead and getting gravel that contains some gold.... At Sport hill all the hydraulics are in active operation.

THE "BIG MINE."—The parties in San Francisco who recently purchased, have made arrangements for continuing the development of the lead. H. H. Sheldon, who has had large experience, has been selected as Supt. A shaft ninety feet in depth has been sunk, and we understand it to be the intention to continue the sinking, as long as practicable, before erecting machinery. Parties inform us that the lead shows splendidly in the bottom of the shaft. The price paid was \$25,000.

MACHINERY.—The Lewis Bros. are erecting an arastra, of the Thoss pattern, to operate in conjunction with their mill. A portion of the machinery is now in town awaiting transportation.

CLARK'S QUARTZ MILL, at Railroad, is kept constantly running. We understand that the machinery works to a charm. Rock from Poe's mine is being crushed.

ELDORADO COUNTY.

CLARKSVILLE.—*Placerville Democrat*, April 8th: We miners are not all dead yet. Some are doing well. Taylor & Brown not long since found a piece valued at \$205, and they have been making good wages all along. To-day they cleaned up and had about \$40.

INYO COUNTY.

CYCLOPS.—*Inyo Independent*, April 1st: "Happy Jack" left at this office specimens of gold rock from the Cyclops mine, which surpass anything in the way of rich ore. The owners of the Blue Bird contribute several beautiful specimens from the tun-

nel, at a depth of eighty feet from the surface. These are of silver, and resemble some of the best Cerro Gordo ores.

SAN CARLOS.—The last run of the mill, was made on 30 tons of ore from the Romelia, one of the company's mines, and resulted in a net return of \$64 per ton. The company are taking steps to procure a United States patent.

DEEP SPRING MILL.—The furnace of Hiskey & Walker fires up to-day, and the mill starts on Monday. Prospecting is going on with great activity, and new strikes are daily reported.

LASSEN COUNTY.

BIG VALLEY.—*Cor. of Sage Brush*, March 20th: The Providence Co. have sunk a shaft thirty feet west of their ledge five feet square and forty-eight feet deep. The rock is very hard, and appears to be the casing of the ledge, containing considerable gold, and some silver. Experts here differ in opinion about the value; some say it will work two hundred and others two thousand dollars to the ton.

NEVADA COUNTY.

EMPIRE.—*Grass Valley Union*, April 4th: The main shaft is 1,000 feet deep on the incline, and there are ten levels. In a short time sinking will commence for the 11th. The mine employs 100 men, of whom 30 work on the night shift. All the hoisting of ore is done in the day time. The mill is kept running night and day. A few days ago very rich specimen rock was struck; the pieces being rich in free gold. The new mill operates to the satisfaction of the owners.

GOOD GRAVEL.—Yesterday the Webster struck into richer gravel than they have yet found. This prospect for four bits to a dollar to the pan. The gravel in W. & Co.'s claims is 8 to 10 feet in thickness in all the drifts which have been run.

ALTA NUMBER THREE.—We yesterday saw a fine specimen of cement from the northeast drift of the Alta No. 3 mine. The mass of cement shows grains of gold stuck around upon it.

EUREKA MINE.—Same of 7th: The Mill for twelve days' run, including Saturday, gave \$22,000 worth of gold. This does not include any from the sulphuretted works. The twenty four days' run gives \$44,000, which is less than any previous run for a long time.

NORTH BLOOMFIELD.—*Cor. of Transcript*, April 5th: The youth of this place is returning. New buildings are going up. The N. B. G. M. Co., the cause of this change, are taking out large amounts of the shining metal. The Yuba Co. are putting up substantial machinery. They will commence sinking in a few days. Fred de Beaur & Co., the Artesian Co. and the Wales Co. are all getting their claims in condition to work. R. C. Black has been running his claims, with splendid gravel, and would have made an excellent clean up had not Chinese robbers appropriated two-thirds.

BIRDSEYE CREEK CO.—Same of 6th: The English Company which purchased the claims and water ditch of Ed. Williams, and the claims of Neece & West, at You Bet, entered in possession on the 1st inst.

Sixty tons of quartz from Burns' claim, the old Potosi on Gold Flat, is being hauled to Stiles' mill to be crushed. This is the third crushing from this lead.

BALTIC.—*Gazette*, April 10th: This Co. on Randolph Flat, began to clean up after a three weeks' run, on Sunday. Their claims are opposite those of Webster Co. The last clean up showed \$30 per day to a man. On Saturday Mr. Walker panned out two pans-full of dirt from which he obtained about \$2 in gold.

PLACER COUNTY.

OPHIR DISTRICT.—*Stars and Stripes*, April 6th: Our report—based on estimates—of the last clean up at the St. Patrick, set the amount at \$12,000 to \$13,500 as the yield from much less than 200 tons of quartz, which was considered the best crushing that had ever been obtained in this section, of unselected rock on an extensive scale. But we have since been informed that the final returns much exceeded the highest of those estimates. At Greene's (the old "Mallet") ledge, supposed by some to be on the Good Friday ledge of the Ophir Co., they have within the past week taken out a large quantity of surpassingly rich rock. Many specimens seem to be almost half gold. The amount of gold in the quartz extracted within the week is variously estimated at from \$12,000 to \$20,000.

The same says that the mining interest in the county generally, shows more life than for 15 years past, not in quartz only, but in tunnel and hydraulic operations as well. The prospect of the Tahoe Canal has given new life to the divide between the North and Middle Forks of the American. The Yule claims, above Last Chance, have

been incorporated, and are in shape for work on a vast scale. The Morning Star claim, adjoining, will also be incorporated. So will the Weske claim, at Turkey Hill. The Mountain Gate claims, at Damascus, which have paid for 15 years, still pay about as well as ever. The Jersey, at Forest Hill, will be incorporated. A large interest has been sold at a round price, the former owner and present manager agreeing to expend \$75,000 in putting the claim in shape for larger operations. The Morning Star claims, at Iowa Hill, still pay well.

DILLON.—*Herald*, April 8th: This ledge was recorded two years ago, but never opened until a few weeks since. The owners, Dillon, Cowan and Himes, have a shaft down thirty-five feet. They had six hundred and fifty pounds of the quartz run through the Empire mill the other day, which yielded within a fraction of \$700, or at the rate of about \$2,000 to the ton. They are now taking twenty-five tons to be worked, which Mr. D. thinks will go \$100 to the ton. The ledge is three miles from here on Rock Creek.

The Graves-Putnam quartz mill, on Baltimore ravine, is running on ore from the Croesus ledge, for the Greek boys, with a prospect of a good clean up.

SISKIYOU COUNTY.

ORO FINO.—*Yreka Union*, April 5th: We learn that the miners at Oro Fino and Mugginsville have more water than they can use. It is thought there is more snow on the Salmon mountains, than for four or five years.

HUMBURG.—The miners on this stream are busily ground sluicing. They will be able to make a tolerably good season's work. It will be sometime yet before they commence to wash up.

TRINITY COUNTY.

JUNCTION CITY.—*Journal*, April 8th: Wm. Clothier & Co. last week struck a very rich deposit on the bench below Keno Flat, and it is believed have just as good ground as that above them. Keno Flat is paying well, and so are all the claims that are being worked.

CANYON CREEK.—J. A. Berger is doing better than ever before. He manages to pick up about \$50 per day to the hand in nuggets, and lets the "small fry" pass into the bed-rock ditches and flume. Adam is certain that this pay will hold out, as he has already prospected several hundred feet in advance of where he is now working.

BAD.—On Wednesday, the reservoir of Sheridan Brothers on Simpson Gulch, broke and the water passed through their claim, carrying everything before it. Their sluice boxes, containing their whole winter's work, were swept away, together with tools and other mining appurtenances, at one blow.

NEW RIVER.—From a private letter we learn that the miners generally are doing well, and have had a great deal more water than in other portions of the county. John Keach is reported to have done exceedingly well.

Nevada.

COPE DISTRICT.

ITEMS.—The Elko *Independent* of April 8th gives these items from a private letter:—The Argenta is getting out splendid rock from its old tunnel; its new shaft is down and it has commenced running for the ledge at a depth of 250 feet. The Independent is the richest thing ever struck in the camp. I have a specimen of half a pound, all horn silver, no rock about it. I saw a specimen that weighed a pound and a half, all horn silver. The owners of one of the mills offered \$3,000 for a ton of this ore which had been hauled to their mill. The Robert Emmet is turning out splendid ore. Samuel Hendy is taking out No. 1 ore from the Pride of the West. Great Eastern, U. S. Grant, Idaho and Nevada, are all turning out splendid rock. Mr. Poole is chloriding near the Excelsior, and getting some of the richest float I have ever seen.

MINERAL HILL.—*Cor. of same*: In March were shipped, per Wells, Fargo & Co., 79 bars of crude bullion, valued at \$120,781, and this from one 15-stamp mill.

ELY DISTRICT.

REVIEW.—*Record*, April 2d: The mills at Meadow and Dry Valleys are running day and night but do not appear to reduce the amount of ore. With a few more mills we could make quite a respectable showing. We do pretty well as it is—shipping more bullion than any camp in the State outside of Virginia City, and that by the employment of only four mills, one of 20, two of 10, and one of 5 stamps.

The bullion shipped for the week ending April 1st, amounts to \$60,693.39.

ITEMS.—Meadow Valley Co. is shipping 60 to 70 tons of ore daily and turning out

more bullion than ever. They are putting up the finest ore dump in the district.... The new stamps and pans for the Burks mine are in place.... The Bowery has begun again and has richer ore than ever.... Washington takes out 30 tons of \$300-ore daily.... Sale of the Washington fell through; the \$30,000 not being forthcoming on time.

SILVER PARK.—Same of 6th: We learn that the camp has now only about fifty inhabitants and is very dull. Sam Ferguson is running his 12-stamp mill in the daytime on rock from Pioche and neighboring districts. The ledges still show well.

EUREKA DISTRICT.

THE BUTTERCUP CO.'S MINES.—*Sentinel*, April 8th: The ledge itself was cut last week in the Mountain Boy. It is five feet wide and very rich. That the ore will smelt \$700 to the ton of base bullion there can be no doubt; as all the assays indicate a much higher figure. About one ton per day, to the man, can be obtained. It would seem to be inexhaustible. In the Kentuck, another of the Co.'s mines, a tunnel 600 feet in length, to strike the ledge 100 feet below the present workings, will be run. Col. Robbins, the Co.'s General Superintendent, has a piece of carbonate ore weighing 800 pounds which is valued at \$600 per ton. It was taken from the last workings of the Mountain Boy, and but for the difficulty of handling in the incline, and transportation to the wagon road, pieces of several tons weight could be obtained.

EUREKA CONSOLIDATED.—*Cor. of Reno Journal*, April 8th: The furnaces of this company turned out \$100,000 worth of bullion during the month of March, netting about \$40,000 to the credit of dividend account. The furnace, separating and refining works of Ogden, Dunne & Co., are the best in the district. The furnace will commence running out bullion to-day, and the separating and refining works will be in operation in a week or two.

HUMBOLDT.

GALENA.—*Cor. of Register*, April 8th:—The White mine gives from three to eight tons of \$400-ore daily. The Blue Leds tunnel is in 125 feet. The ore is worth \$375 per ton. They will commence shipping ore for reduction as soon as the roads will permit.

CENTRAL.—The King and Dennison mines is doing remarkably well. The ledges is three feet in width and shows a splendid body of ore. They are shipping to Reno, and the results are satisfactory. Clark Bros., of the Railroad ledge, are taking out considerable ore.

STAR.—The Sheba is looking better than ever. The Arizona ships fifty tons of \$700-ore per month to San Francisco.

GOLCONDA.—L. D. Webb, of the Second South extension of the old Golconda, states that the more it is developed the better this ledge looks. This vein is well-defined and the average width 3½ feet. He has on this dump several hundred tons.

ARIZONA CO.—*Silver State*, April 8th:—The new mill will be finished by the middle of May. It will run through 40 tons of tailings daily. Of these there are thousands of tons on hand. Six Wheeler pans, three settlers and two concentrators will constitute the mill at present. When the tailings are exhausted, stamps will be put in.

REESE RIVER.

MONTEZUMA DISTRICT.—*Reveille*, April 5th:—Rich discoveries are being made. Veins four feet, the ore of which, without sorting, will work \$500 per ton, sounds incredible; but this is told us by gentlemen lately arrived, who are perfectly sincere. The mill of McGlew & Dawley is doing first-rate. A large lot of bullion was brought here by Mr. McGlew. Everything from that quarter has a healthy appearance.

STAR OF NEVADA.—Same of 7th: This mine, on Union Hill, is yielding ore of high grade. It has long been the property of J. C. Bauer who, in addition owns other parallel veins south. The mine is being worked through a tunnel which it is contemplated to push far enough into the hill to intercept the other veins. A lot of thirty tons just extracted has been worked at the Manhattan mill. We have seen the mill returns of ten tons, and they show \$1,125 92 per ton for first class, and \$302 77 for second class.

WASHOE.

HALE AND NORCROSS.—*Enterprise*, April 2d:—Daily yield 200 tons.

SAVAGE.—The only item of interest is the connection of the drift on the lowest level with the Hale and Norcross. The work of repairing the two north compartments of the shaft, will be completed in two weeks. From 100 to 120 tons of very good milling ore is daily extracted.

FOUR TONS OF SILVER.—Same of the 4th: Yesterday the Yellow Jacket mine, deposited with the Bank of California four tons of silver, worth \$200,000.

GOULD AND CURRY.—On Friday the hoisting works shut down for repairs, only the pump being kept going. The foundations of the two hoisting engines are being made more substantial.

WOMEN MINERS.—Same of 8th: A tunnel is being run south of the old Central Mining Co.'s, tunnel, for the purpose of prospecting the Comstock, which has never been explored in that section. A company of ladies have the entire management, the work being superintended by a lady of this city.

MILLS.—The Gold Hill News says the Rhode Island mill is running steadily on ore from the Crown Point mine. The Pacific mill is being repaired. The Petaluma is shut down for a complete overhauling.

ITEMS.—Same of April 8th: The Kentucky is yielding very good ore from the central portion of the mine, where the fire was. The Chollar-Potosi is yielding better ore and more bullion than ever, and the Halo & Norcross shows well in all its ore resources. Our mines, generally speaking, are looking and doing better than they have for a long time. The Chollar-Potosi pays a dividend of \$10, the Halo & Norcross \$5, and the Yellow Jacket \$2.50 per share. The Kenosha Mining Co. have put an injunction upon the Sierra Nevada Mining Co. The drift from the Daney shaft is progressing at a satisfactory rate toward the ledge, although in hard granite at present. It has about 87 feet further to go in order to reach the ledge.

WHITE PINE.

ITEMS.—News, April 8th: The tramway is not yet ready, owing to the rough weather. Shaft in Original Hidden Treasure is 48 feet deep. The mine looks well. The new ore-house of South Aurora is nearly completed. Very high grade ore in Ward Beecher Consolidated. Noonday is down 128 feet, and the ore looks better than ever. Genesee has improved steadily for six weeks. Bourhon is not worked out; looks as well as in its best days. Empire has a good showing. Six tons of ore taken out, worth \$100 per ton. A larger force will be put on Silver Plate. Work to be started on Grant & Colfax. Four men at work on El Dorado. The ledge is very large and runs \$30 to \$40 per ton with very little assorting. Of the base metal mines, Miner's Dream pulped \$111.50 per ton at Big Smoky mill. Trench has on dump a large quantity of high grade ore.

TEM PIUTE.—Good reports from this district. The Crescent mill, of 10 stamps, 16 miles from the mines, is running steadily. Col. Baker has opened three mines, which look promising. The McMurray and Thompson mines are both opened, and ores from the McMurray assay \$1,000 per ton. This, it is claimed, without selecting. There is a drawback to the district, owing to the great distance to wood and water; but citizens there feel confident of the future, and claim that Tem Piute will in time overshadow Pioche.

Arizona.

BRADSHAW.—Prescott Miner, April 1st: New discoveries are every day being made, and the numerous shafts and tunnels that are being driven in the Tiger, Eclipse, Cougar, Del Pasco, Hunter, and other lodes, are developing said lodes to the entire satisfaction of owners. Among the latest discoveries is the Yreka, a lode containing immense quantities of gold and silver. Specimens brought in by Revoirs and others, are as rich as any we have ever seen. Near the Del Pasco, every gulch was filled with placer miners who were making \$5 to \$20 per day, with rockers and pans. The dirt below the Yreka lode, also, prospects big.

HASSAYAMPA DISTRICT.—Work upon the Davis lode is being pushed. Last week two men in three days, took out 25 tons of ore. The ledge is 8 feet thick. Messrs. Clark and Davis gave us less than a pound of rock, which we crushed, getting therefrom a teaspoonful of silver and gold. R. W. Groom says it is the richest ledge he has ever seen.

WALKER.—Arastros working away. Sluice-head of water in the creek. Placer miners making from \$5 to \$20 per day.

Colorado.

ITEMS.—Georgetown Miner, April 6th: A large number of lodes in Clear Creek county have lately been sold by W. B. Rockwell, of Central City, for \$1,000,000 to the Colorado Smelting and Mining Co., of New York. The silver lullion from Georgetown during the past week aggregates in value \$15,551.53, coin. Mo-hawk furnishes ore that assays \$2,200 to

the ton. The Brown Co., shipped last week a button of silver weighing 4,184.46 ozs. Troy, valued at \$5,140, coin. The returns for the last six days, shipments from the Stewart Co., aggregate \$9,157.06 coin, the largest weekly shipment since the mill commenced treating ores. We have never seen the time in the history of silver mining in Colorado when as many mines being successfully worked as now.

ITEMS.—Register April 5th: The Kansas lode has eleven shafts going down, all in fair pay. Miley's mill and the Black Hawk Co's are each dropping stamps upon it, and ten more are kept busy at the New York mill, all for Wheeler & Sullivan. The Gregory Second, is turning out 300 ounces of gold per week. Mead's mill is returning ten ounces per cord. Six different parties are working upon it. The Roderick Dhu ore is running five ounces in the upper level, and the ore from the main shaft, now 350 feet deep, promises much better. The new vein in the bottom of the shaft in the Caribou is 3 1/2 feet wide, and carries from 150 to 200 ounces of silver per ton.

Idaho.

ITEMS.—Avalanche, March 18th: A. P. Minear informs us that the parties who purchased and incorporated the Minnesota will soon arrive from San Francisco to commence operations, among them the well-known Bill Lent, Geo. Hearst and Johnny Boyd. The latter is Supt. We also understand that Mr. M. is about to purchase the Allison mine for a San Francisco company.

MORE JUMPING.—We understand that O. H. Purdy & Co., have taken possession of what is known as the Minnesota mine, which they claim as an extension of the New York.

The Idaho City World says the mining season is very backward and miners are anxiously waiting for the melting of the snow and the opening of the spring work.

WARREN'S DIGGINGS.—Cor. Walla Walla Union, April 1st: Big Meadow has an excitement. Two parties have got down to bed rock, and found fifteen cents to the pan. The McLane new mines produce well. Fifty feet of McLane's claim sold for \$500.

Utah.

The New York Iron Age of March 30th learns that the "Emma" was bought by Messrs. A. V. Stout, A. A. Selover, Gen. Baxter, and Duncan, Sherman & Co., for \$1,500,000, and \$200,000 has been deposited with H. B. Clafin, who is trustee for the owners, to bind the bargain.

Montana.

RADERSBURG.—Helena Gazette, April 3d: We are told that the Iron-clad is now thought to be the richest claim in Montana, and that there are shares which could not be purchased for \$100,000. Nave's claim is paying \$40 per ton from the plates, without including the deposit in the batteries, which were a network of gold last week, and the tailings, several feet below the mill panned out rich.

VIRGINIA CITY.—Montanian, March 30th: McGovern & Co. have commenced work on their bar claims, opposite Nevada, and by the time the frost is out of the ground will have everything in readiness for sluicing. Walt Seovill has been driving a tunnel into the bar on the Nevada side of the gulch, and has struck what he thinks will pay fair wages. Sedman & Co.'s flume will be ready for the first flush of water.

BLACKFOOT.—New North-West, March 31st: Mining began on Monday—Horan & Co., Martell & Kimery, and the Ah Sing Company started up. If the weather is moderate nearly all the claims will start up in a week or ten days. There are 400 or 500 inches of water in the gulch.

CEDAR CREEK.—Mr. Noys returned yesterday. He reports work lively about Forest City, which is absorbing Louisville. It is anticipated work will soon be retarded by an excess of water.

The Independent of April 1st, reports plenty of water and great expectations for the season among the miners of several different localities.

COOKING FOOD FOR ANIMALS is denounced by Prof. Smith in the Rural New Yorker. He contends that it is against Nature, which has fitted their organs for raw food; and the meat is unwholesome. We are sorry to say we think the Professor is learned overmuch. Our domestic animals are taken from Nature and put into artificial life. Much rest is required for the digestion of raw food, which animals, in their native condition, can command; but that rest is denied them when trained to the service of man; hence cooking their root food and their corn is a kindly consideration for their deprivation of liberty.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., April 13.

The Stock Market has been weaker during the past week and very irregular. Amador has sold at \$350. Crown Point has reached its highest point (\$180) and Halo and Norcross its lowest (\$63) for years.

Last Saturday the following local mining incorporations paid dividends for March: Amador, \$14,800; Halo and Norcross, \$40,000; North Star, \$9,000; Yellow Jacket, \$60,000.

Wells, Fargo & Co.'s treasure report for the quarter ending March 31st shows as follows:—

	Silver Bullion.	Gold Bullion.	Coin.
January.....	\$1,237,509	\$1,202,649	\$1,308,089
February.....	1,198,295	1,117,780	1,024,712
March.....	693,838	1,477,946	904,156

Totals..... \$3,039,642 \$3,805,375 \$3,236,957

Of this, \$8,528,962 were from northern and southern mines, \$531,691 from northern coast route, \$212,246 from southern coast route and \$809,075 from Mexico. By other consignees, \$355,250 were received from foreign sources.

The above amounts include all the treasure received in this city through Wells, Fargo & Co.'s Express, as well as the amounts remitted directly to the East from Virginia City through the same channel. No returns of the Virginia shipments East for March have been received, but the amount thus sent is estimated at \$690,000, to be added to the above, to make the report for the quarter complete.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock:

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING MARCH 28TH.

MECHANICAL TELEGRAPH INSTRUMENT.—James Gamble, San Francisco, Cal.

WHEEL FOR VEHICLES.—James Harris, San Francisco, Cal.

SKATE.—David Kerr and Asa Ebenezer Hovey, San Francisco, Cal.

GANG PLOW.—John Murray, Silveyville, Cal.

GRINDING MILL FOR ORES.—Jacob S. Niswander, Oakland, Cal.

AXLE AND AXLE BOX FOR VEHICLES.—Ernest Von Jeinsen and James Monroe McDonald, San Francisco, Cal.

SASH-HOLDER.—Barnet M. Whiting, San Francisco, Cal.

ANIMAL TRAP.—James William Fishback How, Douglas County, Oregon.

CHLORIDIZING SILVER ORE.—Eugene N. Riette, San Francisco, Cal., assignor of five-fourteenths interest to Charles A. Stetefeldt, same place, and five-fourteenths to John H. Boalt, Sandusky, Ohio.

TRADE MARKS.

WHISKY.—Daniel V. B. Henarié, San Francisco, Cal.

WHISKY.—E. Martin & Co., San Francisco, Cal.

TEA.—Williams, Blanchard & Co., San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

APPARATUS FOR BURNING HYDRO-CARBON OILS.—J. R. Lee, Grass Valley, Cal. The object of this invention is to provide a device by which a more perfect combustion of hydro-carbon oils is secured, when they are employed in the furnaces of steam boilers, and also to assist and promote such combustion by the employment and utilization of exhaust steam within the furnace. A series of shallow troughs are placed in the furnace, preferably in a transverse position. The oil is fed into these troughs, so as to have little depth, and there burned. A pipe, or series of pipes, arranged around the interior of the furnace, receives a portion of the exhaust steam and throws it into the fire in fine jets; while steam, introduced in like manner behind the bridge wall, serves to increase the draft as may be desired.

BALE-TIE.—J. E. Perkins, S. F. This device for securing bales of cotton, wool, hay or other material which is to be held together in a bundle, consists of a strap of iron which is folded back upon itself at one end and holds a stout link in the bight. The strap being passed around the bale at the desired point, the other end is passed through the link, and after being drawn as tight as possible, is bent back upon itself, forming a bight over the link, and is secured by slipping a movable band over this bight.

GANG PLOW.—J. W. Sursa, San Leandro, Cal. The object of this invention is to provide an improvement in gang-plows, in which, by a peculiar arrangement of the axles of the bearing wheels and their connecting link, the plow frame is maintained in a horizontal position at all times,—when one wheel runs in the furrow and the other on the land, or with both wheels on a level,—and this by the use of the single lever which raises and depresses the plows, without altering a bolt or other part of the device. The simplicity of the device, together with its great efficiency, will recommend it highly to the attention of farmers.

HOSE-SPRINKLER.—W. Anderson, S. F. This very neat, simple and effective device is illustrated and described on another page.

Hose-Sprinkler.

The accompanying illustration shows an exceedingly neat and useful apparatus, which is used as a sprinkler for vegetation and wherever a spray is beneficial or useful. The device is the invention of an engineer of this city and is manifestly a great improvement on the sprinklers which are commonly used. The drawing shows the sprinkler in operation, and also the essential part of the device which is represented as lying on the walk in the foreground.

The apparatus consists of three or more hollow curved arms, attached to a central cylinder which revolves upon the upper end of a vertical pipe to which the hose is attached. Holes are made at intervals through the vertical pipe in the track of the openings in the curved arms. These allow the water to be forced out through the arms when the holes in these arms are opposite the holes in the vertical pipe, but cut off the supply at other times.

The reaction of the water escaping from the ends of the arms, causes these to rotate, but instead of the stream being thrown in a circular track, as would be the case were

ANDERSON'S IMPROVED HOSE SPRINKLER.

the water fed into the arms continuously, the alternate cutting off and letting on the supply, effected by the means above given, causes the water to be distributed in a fine spray over the whole area from the center to the circumference. The apparatus is mounted on a neat tripod, and its effect when in operation is exceedingly pretty.

This sprinkler is economical of water, which it uses to the best effect, throwing the water in a fine spray so that it is all absorbed in the ground and does not run off. Hence, also, it does not need to be changed so often as other devices of the kind. It will water an area ten to fifteen feet in diameter with an easily obtained pressure, say, from a tank twenty to twenty-five feet high. It is an ornamental appendage to any grounds; is very durable, being entirely of brass; and is not liable to get out of order. The only possible danger is from overturning the stand, when one of the arms may be bent; but these are easily replaced.

These sprinklers may be seen in operation on the Plaza or on the grounds of Mr. Milton S. Latham, in this city. Mr. R. H. McGill, at Alameda, and Mr. Tubbs, at Brooklyn, are using them. At Oakland, Dr. R. E. Cole, Messrs. G. W. Armms, J. De Fremery, R. Gibbons, N. W. Spaulding, and others employ them. They give the best satisfaction wherever used and are rapidly increasing in favor.

A patent has been granted for the device, through the SCIENTIFIC PRESS Patent Agency, to Mr. William Anderson, of this city. The sprinklers are manufactured and sold by W. T. Garratt & Co., corner of Mission and Fremont streets, S. F., to whom apply for further information.

The Ferret and its Usefulness.

EDITORS PRESS:—I beg to offer you a few lines with regard to the ferret, which is a most useful little animal, both for town and country. It is the natural foe of the rat and rabbit tribe, and as such must be a friend to every farmer, besides which it offers every one an hour's amusement whenever they want it, or rather, I ought to say, an hour's exercise and excitement. Squirrels and gophers are poisoned and caught by means of traps, but these are slow, expensive and dangerous methods; the money expended in a dozen traps would purchase a ferret, and would catch five times as many animals in a less space of time. Poison is dangerous to other animals, as well as expensive.

A ferret put into a gopher or squirrel hole would master its inmate in a minute or two. For ferocious courage they are not even excelled by the thoroughbred bull-dog, which, with their great activity, gives them an advantage over much larger animals than themselves. Put a ferret into a corn stack and the rats leave *sans ceremony*,—aye, quicker than illicit distillers with an exciseman after them. You have

ject to a disease of the feet, if bred in, or not kept clean. They have a very strong smell, and consequently require to be kept in an outhouse or stable, and the sand or straw in their cage should be changed once a day. They are all harmless, unless teased at feeding time or hurt, when they will bite their master as soon as look at him; but then, though painful, there is no attendant danger thereupon. The largest are about 20 inches in length from tip of nose to end of tail; but they are not above 2 to 2½ inches in height, their legs being very small; wherever a good-sized rat or gopher can go, they can. A small bit of meat is all they require each day. In conclusion let me say that this is indeed a valuable animal to every farmer and country resident, and I trust it will not be long ere they will be as common as they now are scarce.

E. W.

Agricultural Operations in Montana.

EDITORS PRESS:—We have not got fairly about our spring's work here yet, though it is well under way in some of our valleys. As for that matter, however, we might have been doing "spring's work" all winter, for the weather has been mild and delightful, and our roads dry and dusty. Indeed, strange as it may seem, the lack of snow is our great drawback here in the Rocky Mountains. We have not had two inches of snow on the ground at any time in our valleys and foothills this winter, though it is said that there is enough in the mountains to make a more prosperous mining season than we have had for some years, and our farmers are preparing for an increased demand for agricultural produce, that a successful mining season will develop, by cultivating an increased area of land. In fact our people have been steadily paying more and more attention to agricultural pursuits, as their preconceived opinions in regard to climatic difficulties, etc., have vanished before demonstrated facts, which prove that, for bounteous yielding of the staple agricultural products, our valleys are second to no land on the continent.

We have raised as high as 87 bushels of wheat to the acre, and other grains in proportion, and I will not here go into figures in regard to potatoes, onions, cabbage, etc., for fear that I might shake your faith in the old proverb; but they yield enormously. But while Montana is great in an agricultural point of view, as a grazing and stock-raising country she is pre-eminent. Our cattle fatten on our foot-hills and in the mountains the year round, never having to be fed. Manage to live, you suppose? They are rolling fat all the time. Our "bunch grass" for fattening stock, exceeds anything that ever grew, and its great nutritious quality is maintained through the winter, as we have no rains after it ripens to bleach it out.

Still, notwithstanding our unrivaled advantages for stock raising, I would suggest to our herdsmen and farmers whether they are not over doing the business at present. Our people, seeing a money making business, are apt to go into it "all over," and from that very reason, by over doing it, are pretty sure to come out "all under."

Fair dairy cows are worth \$75 here now, and have been for the past year, while scrub cows—inferior, and that have never been milked—are worth \$50 and upwards. Now this is a higher price, taking into consideration the quality of the stock, than is obtained in the most thickly settled States of our Union to-day; and it is a question for our people to consider, whether such a state of things can be sound and permanent. While stock raising must be a highly remunerative occupation here, when carried on under proper conditions; still it seems that the present high prices cannot long rule, especially after we have railroad communication with the East, which it now seems probable we soon shall have; and when the crash in the present inflated prices comes, as come it surely must, those who have invested largely at present figures, will find they have made an unfortunate speculation; while those who commenced when prices were moderate, and depended on the increase of their stock, will find that they have made money at whatever figures prices may go down to.

MILTON.

LAKE WASHINGTON COAL MINE.—The *Alaska Times* learns that a Mr. Dinsmore has arrived at Seattle to close the bargain for the sale of the Lake Washington Coal Mine, which was sold some weeks ago to a company of capitalists in San Francisco, for the sum of \$51,000.

The female has only one or at most two litters of young during the year, from two to five at a birth. They are sub-

Grape Growing, etc., in the Mountains.

EDITORS PRESS:—Grape grafting has become general in El Dorado county. The "V" knife spoken of some time ago in a communication to the Press, by Mr. Briggs of Alameda county, is not in favor here; although the inventor is a resident of this place. The manner of grafting the vine is to dig the earth from around the roots to the depth of about four inches, saw off the vine, then split or saw the stump to the depth of about one inch, and with a sharp, thin-bladed knife, smooth each side next to the bark, and fit the scion which should have about three buds; after which the earth should be closely packed around the stump and graft, leaving one bud just at the top of the ground. I am told that from ninety-five to ninety-seven per cent. of vines treated in this manner grow and in most cases bear a small crop the same year.

Mr. W. B. Othick, of Coloma, informed me that he has taken 15 lbs. of flame colored tokay, from a graft of that kind, set to a California Mission grape root or vine; but from three to five pounds is a fair estimate for the vine to produce the first year.

Are Vineyards Valuable in the Foot-Hills?

In an action of B. N. Bugbey, of the Natoma Vineyard, in this county, against the Natoma Canal Co., for damages in going through Mr. B.'s land, that gentleman showed by several witnesses that his vineyard was worth more than \$250,000; that 85,000 to 90,000 vines produced from 600 to 800 tons of grapes worth at least \$50 per ton, or more than \$30,000; and after the Commissioners had taken testimony for more than twenty days, and had also visited the premises, they rendered an award in favor of Bugbey and others, of over \$19,000 or nearly \$2,000 per acre for the land used by the Canal Co.

C. D. Brook, of Diamond Springs, whose vineyard and peach orchard I have spoken of in a former communication, in a contest before the Land Office at Sacramento, in proving title, testified that his place was worth more than \$12,000 and a witness for Brook, an old resident of the county, testified that in his opinion the place was worth \$19,000. B. N. Bugbey, said in his examination that he could afford to pay \$25 per ton for grapes delivered at Shingle Springs and considered them worth twice that amount when delivered at his place in Folsom.

It is no wonder, that in view of such facts as these more vines are being planted out this year than at any other time before.

Fruits of all kinds paid the producers better last year than over before; hence the effort at this time to increase the number of vines and fruit trees.

For the year ending the first of May next, there will have been manufactured from 10,000 to 12,000; gallons of brandy, in this county, which at this time finds a ready market at from \$1.50 to \$4.00 per gallon. This wide margin in price is caused by the amount manufactured and its reputation in the market. B. N. Bugbey's make, distilled by the Johnson process and put up in nice eighth pipes—22½ gallons, of uniform strength and color, readily commands the highest figure. Many manufacturers pay no regard to the size or condition of packages, allowing them to range from 10 to 200 gallons capacity each, and the strength varying from 8° below to 30° above proof, some with and others without coloring; and under a combination, it is said, of liquor dealers in San Francisco, the price has run little if any above \$1.25 at the manufactory.

But the combination game of the dealers is now played out; for I know that orders have been received here from the East to purchase all that can be procured in the county—the price ranging from \$1.50 to \$2.00 in coin, per gallon.

J. W. Foster & Son., of this place, ship their wine to Chicago, where it nets them about \$4 currency. That manufactured by B. N. Bugbey, of the Natoma Vineyard, Foster & Son., of Placerville, R. Chalmers and W. D. Othick, of Colman, and C. G. Carpenter, of Diamond Springs, is sought after by Eastern purchasers.

In a former communication to the PRESS I spoke of J. W. B. Dickson's shipment of two car loads of brandy and wine to his brother at Meadville, Pa. Dickson has now filled another order from his brother

for 2,000 gallons of brandy at \$1.50 per gallon, he furnishing the packages. This, he tells me he is going to ship by Panama, believing it will go quicker by that route than by rail, and at much less freight. By contract the last shipment was to have been delivered in 17 days; but was over 40 days in transit.

Fruit trees are late this spring in putting forth their blossoms, but appearances indicate a full crop.

Wheat in the Foot-Hills.

T. J. Patnt, a farmer residing near Gold Hill, last year raised on five acres of ground, 166 bushels of fine seed wheat, said by judges to be the finest ever raised in the county. Patnt summer fallows, and this year he has one field of 17 and another of 23 acres of wheat sown on land prepared in that manner, and from present appearance he will harvest 40 bushels per acre. All who have adopted this mode—summer fallowing—unite in saying that a good crop of wheat or barley can be grown with certainty every alternate year in our foot-hill counties.

The "Early Rose" Potato

Has been grown in this vicinity with success. From 27 lbs. planted by Mr. McKay in May last, in nine weeks he gathered 490 pounds.

The Mines.

Notwithstanding the small amount of rain the past winter, mines have been more successful about here than for a long time previous. The Hook and Ladder company has not cleaned up in six months; but have paid thousands for water in that time. Blacklock & Co. are doing remarkably well, so are Hancock & Co., each using some 300 inches of water when at work. I know of one claim that has paid over \$200, for every ten hours they have used water, and their water bill amounted to thousands in the last year at \$20 per day. Some of the porphyry claims, I wrote you about when they were first discovered, one year ago, have paid enormously to the owners—while some have been a total failure.

There is quite a flattering prospect of a new canal being constructed the coming summer, which will insure a large and lasting supply of water. If my hopes are realized El Dorado will take an advanced position that will be hard to check, and will make her one of the wealthiest mining counties in the State.

Through the Press you invite your correspondents to send their photographs. To that invitation I intend to respond, it being about the second time that such a request has been made of me; the first having been made by a young lady of the "Hub City," some twenty-five years ago; but I palmed off the original on her, and although we have resided in California near twenty years, she has not as yet applied to the courts for redress. E. N. S. Placerville, April 3, 1871.

Wood Preserving.

There was laid on our desk, last week, a thin piece of wood, on which was pasted the following information:—

This piece of Stow Foundation Pavement was preserved by the Pacific Wood Preserving Company, and laid in New Montgomery street, in the city of San Francisco, during July, 1869. It was taken up March, 1871, and was cut from one of a hundred blocks laid in a body, to show the durability of the Stow pavement preserved by the Robins' process. All the blocks of preserved wood were found to be sound. The blocks are worn not to exceed one-eighth of an inch by the twenty months' service, which would give a durability of not less than twenty years, without repairs.

Works for preserving wood are on Berry street, near Fourth, San Francisco.

The wood is certainly in an excellent state of preservation and but slightly worn on the upper surface. The Robins' process, alluded to above, consists in placing the wood in air-tight chambers, connected by a goose-neck with a large still containing the oil of coal-tar or crude petroleum, as may be desired. The coal-tar or petroleum vapors, generated in the still, pass into the air-chamber, drive the air out of the wood, it is claimed, coagulate the albumen of the sap and fill the pores of the wood with creosote or carbolic acid. The wood is said to be thoroughly saturated with the preservative elements and protected against moisture.

Good Health.

Water in the Stomach.

The first effort of nature when water has been received into the stomach, is to remove or take up from it all the elements of nutrition which it may contain. If it contains sugar or meat or anything else which may go to feed the system, those elements, if the stomach is in a healthy condition, are first abstracted and digested, and whatever of inorganic matters, it may contain, not needed in the system, are cast off by the excretories, or at least the effort is made to so dispose of them by those organs.

Sometimes minerals or other poisonous substances are taken into the stomach in such a form that the assimilative organs take bold of them and distribute them throughout the system, before the excretories can act. Poison is thus diffused in the system, more or less rapid in its action, according to its nature and the quantity present.

We often drink infinitesimal quantities of poison—generally disorganized vegetable or animal matter—in the water which we imbibe. The sickness in low swampy neighborhoods is generally due more to the water than the atmosphere. It was the deleterious substances in the waters of the Chickahominy swamps, drank by the soldiers, which decimated our army there—not the malaria of the atmosphere.

We have already alluded in previous issues, to the unhealthy nature of partially decayed food. Nothing but organized matter seems to aid in building up the system. Meat, flour, corn, barley, etc., when taken into the stomach in their natural condition, undecomposed by either cooking or any other exposure, are immediately digested; but when decomposition commences before they enter the human stomach, that decomposition is only accelerated there, and they are converted into poisons.

Sugar is produced from the cane or beet without decomposition, and is therefore a healthy nutriment. Alcohol is the result of the decomposition of sugar from molasses, corn barley, etc., and, is therefore poison. Medicines are generally poisons, taken into the system to accomplish certain specific objects, apart from building it up; alcohol is thus employed as a stimulus—its origin from decomposition precludes the possibility of its utility as nutriment. If taken in excess, like all other stimulants—which are always poisons—it is followed by a more than corresponding depression of power. Alcohol is a goad, a whip—good for proper use, but dangerous in proportion to its excessive employment. People cannot be ever careful in selecting good water, nourishing food, or too cautious in avoiding stimulants.

In-Growing Toe Nails.

We described a mode of treating this painful trouble, a few weeks since, by filing the nail down, on the principle that one cause of the disease was an unnatural thickening of the nail. We now append the following upon the same subject from the *Herald of Health*:—

The most painful of the diseases of the nails is caused by the improper manner of cutting the nail (generally of the great toe), and then wearing a narrow, badly-made shoe. The nail beginning to grow too long, and rather wide at the corner, is often trimmed around the corner, which gives temporary relief. But it then begins to grow wider in the side where it was cut off, and as the shoe presses the flesh against the corner, the nail cuts more into the raw flesh, which becomes excessively tender and irritable. If this state continues long, the toe becomes more and more painful and ulcerated, and fungus (proud flesh), shoots up from the sorest point. Walking increases the suffering, till positive rest becomes indispensable.

Treatment.—We omit all modes of cut-

ting out the nail by the root, and all other cutting and torturing operations. Begin the effort at cure by simple application to the tender part of a small quantity of perchloride of iron. It is found in drug stores in a fluid form, though sometimes in powder. There is immediately a moderate sensation of pain, constriction, or burning. In a few minutes the tender surface is felt to be dried up, tanned, or mummified, and it ceases to be painful. The patient, who before could not put his foot on the floor, now finds that he can walk upon it without pain. By permitting the hardened, wood-like flesh to remain for two or three weeks, it can easily be removed by soaking the foot in warm water. A new and healthy structure is found, firm and solid, below. If thereafter the nails be no more cut around the corners or sides, but always curved in across the front end, they will in future grow only straight forward; and by wearing a shoe of reasonably good size and shape, all further trouble will be avoided.—*Bostwick's Medical and Surgical Journal.*

An Important Surgical Success.

On Thursday last, it was our pleasure to see, "bottled up," in the office of Dr. E. J. Fraser, at No. 108 Stockton street, an immense cancer, which he had a few days previously removed from the breast of a lady, from Alameda county.

We were so much interested in the ease, that we visited the lady in person, (as she is still in the city under treatment) and from her received the following history:—

She is now 52 years old. About a year ago she discovered a small lump in the left breast. As it grew rapidly she employed the best medical skill she could find, to remove it if possible; but it continued to grow till it involved the entire breast, making a dark red tumor, as large as a child's head. It also extended across the breast-bone, and was rapidly progressing towards the other breast. The left arm was swollen to twice its ordinary size, was very painful and so nearly useless, that she could only with great difficulty, dress herself without assistance. The glands of her neck were swollen and very sore and painful, and there was a severe burning pain between the shoulders and under the shoulder blades. A large crack, half an inch deep and three inches long, extended across the breast, which discharged the peculiar cancer juice quite freely. It was an open cancer.

She had applied to several surgeons to have it removed, but no one could be found who dared to undertake so formidable an operation.

The whole mass was removed by the aforesaid surgeon in 17 days, by the use of a paste, of his own fabrication, without the loss of a drop of blood or a night's rest.

It is now sixteen days since the tumor was removed. The sore is fully two-thirds healed and looks healthy. The pains and swellings are all gone, her appetite is good and general health very much improved. On the whole it looks to us as though the cure would be perfect.

We are informed that all the different varieties of cancer, as well as lupus, are treated by this method with a success equalled by no other.

BONE FELON.—Of all painful things can there be any so excruciatingly painful as bone felon? We know of none that flesh is heir to. As this malady is quite frequent and the subject of much earnest consideration, we give the latest recipe for its cure, which is given by that high authority the *London Lancet*:

"As soon as the disease is felt put directly over the spot a fly blister, about the size of your thumb nail, and let it remain for six hours, at the expiration of which time, directly under the surface of the blister, may be seen the felon which can instantly be taken out with the point of a needle or a lancet."

GOOD HEALTH is essential to a well-directed mind.

Artificial Appetites; Milk and its Adulteration; Sugar, Starch, etc.; Domestic Receipts; Me- chanical Hints.	234

Notices to Correspondents.

COMMUNICATIONS RECEIVED.—From I.
Richards on Transcontinental Traffic;
from "Crowquill," on the Inyo County
Mines; from "G. M. W.," on Improve-
ments in Locomotives; from "Index," on
Flint Creek District, Montana.

GONE EAST.—Mr. A. T. Dewey, the
senior member of our firm, has gone East
for a short time, to visit the "old folks."
Any personal communications to him dur-
ing the next two or three weeks, should be
directed to Westfield, Massachusetts.

NAHL'S ART GALLERY.—The "opening
day" of this gallery brought hosts of lovers
of art to the new photographic rooms of
the Nahl brothers, on Montgomery street,
opposite the Lick House. A visit to the
place, last Wednesday, by invitation of the
artists, whom the coast honors, formed a
delightful episode of the week. The
paintings, drawings and photographs,
nicely and artistically arranged in the well
appointed establishment, were convincing
evidences of the talent and taste of the pro-
prietors, to whom we wish the reward
which they merit.

THE HOWE SEWING MACHINE.—We give in
another place an interesting history of the
sewing machine and of its inventor. In the
article, allusion is made to the "Howe ma-
chine," one of the very best, as there indi-
cated. In the new building adjoining the
"White House," on Kearny street, near Post,
—at No. 113, one of the finest commercial
buildings in this city—is the office of the
machine and also of Buttericks pattern
agencies. The elegant fittings, extensive
display of goods and excellent machines
render it one of the most attractive sales-
rooms on the coast.

THE late rains are everywhere reported
as having given new confidence in a con-
siderable yield; but another rain will soon
be needed as much as the last one to secure
crops from nearly a total failure through-
out a large portion of the State.

Narrow Gauge Railways.

Not many years ago the battle of the
gauges was waged fiercely, but the narrow
gauge came out victorious. Then the nar-
row gauge was 4 feet 8½ inches. Now
we are having a contest between gauges as
to whether the still narrower gauge is ad-
missible.

The success of the narrow gauge is again
indisputable for mountainous lines and in
sparsely settled countries. In such cases
the construction of the broader gauge, un-
less on trunk lines with large traffic, will
result in disaster.

We are certain to have several narrow
gauge lines on our Pacific coast before
long, Nevada promising to be the first to
have one or more lines completed. Every-
thing, therefore, bearing on the subject is
of interest, and we have from time to
time published articles relating to narrow
gauge roads.

We learn from the *American Railway
Times* that the Railway Committee of the
State of Massachusetts have had the gauge
question under consideration, and have
made a report in which the general subject
is discussed with ability and fairness by
the chairman, who is a civil engineer of
considerable eminence. The report ad-
vises the authorization of the construction
of roads with three-foot gauge. It gives
estimates of the cost of building and
equipping roads with 2 foot 9 inch and 4
foot 8½ inch gauge in this country, and we
copy the portion of the report relating to
this, as one of the best which has been
made with reference to our wants.

Let us estimate the cost of building and
equipping one mile of a cheap railway, 25
miles long, of 2 foot 9 inch gauge, where
the average depth of cuttings and embank-
ments may be reckoned at four feet. The
sectional dimensions, and the bridging,
masonry and sidings being deduced and
averaged from a surveyed line, and the
equipment conformed as nearly as practi-
cable to the recommendations of the India
committee and of practical builders in this
country, the prices being actually guaran-
teed by the latter, viz:

Rails.....	\$4,243 00
Sleepers.....	352 00
Spikes.....	175 00
Joint fastenings.....	400 00
Laying track.....	250 00
Embankment, 6,062 cubic yards.....	1,513 00
Cuttings, 5,629 cubic yards.....	1,480 00
Rock cutting, 1,611 cubic yards.....	1,611 00
Ballast.....	1,000 00
Sidings.....	200 00
Masonry and bridges.....	1,140 00
Rolling stock for whole road, say:	
Engines, 3.....	\$18,000 00
Passenger cars, 5.....	5,500 00
Mail and baggage cars, 2.....	1,200 00
Merchandise cars, 35.....	6,125 00
Merchandise cars, 25.....	4,000 00

\$34,825 00÷25=1,393 00

\$13,757 00

And the estimate of cost of same road
with similar grades and alignment, with
a gauge of four feet eight and one-half in-
ches, with the usual provision for rolling
stock, viz:

Rails.....	\$6,600 00
Sleepers.....	924 00
Spikes.....	264 00
Joint fastenings.....	700 00
Laying track.....	325 00
Embankment, 8,604 cubic yards.....	2,151 00
Cutting, 11,703 cubic yards.....	1,927 00
Rock cutting, 2,085 cubic yards.....	2,085 00
Ballast.....	2,000 00
Sidings.....	334 00
Masonry and bridges.....	2,000 00

Rolling stock for whole road, say:	
Engines, 3.....	\$48,000 00
Passenger cars, 5.....	20,000 00
Mail and baggage cars, 2.....	2,600 00
Merchandise cars, 30.....	30,000 00
Merchandise cars, 20.....	16,000 00

\$116,600 00÷25=4,664 00

\$23,974 00

The difference is that of nearly one
to two, and shows that where cheap roads are
practicable, the use of the narrow gauge
may reduce the cost about one-half, with-
out reducing necessary efficiency.

STRAWBERRIES are beginning to come in
quite freely. The small fruit crop prom-
ises to be very abundant, the present sea-
son in this vicinity, if not generally,
throughout the State.

Mining Dividends and Assessments.

The remark is only too common that
mining absorbs two dollars for every dol-
lar produced. This remark is true only in
the sense that the two dollars absorbed
have been for the most part thrown away.
The manner in which persons have invest-
ed in the wildest schemes and the biggest
stock gambling operations, would go far in
a jury trial to prove the insanity of the in-
vestors. But such things have nothing to
do with legitimate mining. A like manner
of conducting any business operations
would result as disastrously,—would ruin
the Rothschilds in a year. And, again, on
this coast, a mine is not considered a suc-
cess unless it returns the enormous divid-
end of five per cent. a month,—at least,
our capitalists are unwilling to invest at
lower rates. Now what other business
will do this to the extent that mining has
done?

We have already asserted, and still as-
sert, that our mines, properly and legiti-
mately worked, will give as good returns
as any other operation,—will do far better
than most.

Considerable matter of interest is shown
by a statistical table published last week
by Richard Wheeler, editor of the *Stock
Report*. This contains a statement of the
assessments levied and dividends disbursed
by fifty-three of the leading mining com-
panies whose stocks are chiefly dealt in by
the S. F. Stock Board. We give the table
(in part) below, as valuable for reference.

CALIFORNIA COMPANIES.

This table of itself does not give an ex-
plicit idea of the profits of mining on this
coast. It treats only of those mining en-
terprises which are largely represented in
the Stock Board, and no account is taken
of the disbursements from the several
mines before the incorporation of the com-
panies, which disbursements were in cer-
tain instances very large. But the figures
go to show that the dividends far exceed—
are twice as much in amount as—the as-
sessments, that many of the operations
have returned a splendid interest on the
money invested, and that no other specu-
lation has been more or even as profitable.

Now add to this, the fact of early reck-
lessness and extravagance, the fact that the
management of a mine has often gutted the
property, has taken out every cent in divid-
ends to bull the stock, sell out at high
figures and make a fortune in a day regard-
less of the future of the property, consider
all the fraud and ignorance—and it cannot
but be astonishing that such results as
those here given have been possible. No
other business than mining could have
done so well.

Mines and Mills.

Under this heading the *Eureka Sentinel*,
of March 25th, gives a number of examples
to prove its statement that mills should be
erected at Eureka. It commences its article
as follows. We should like to ask, how-
ever, whether it has seen any quartz ledges
under the carbonate deposits.

The explorations in this district have
proven that there is much ore that is very
profitable to reduce by mill process, and at
the greatest depth many of the mines that
produced ores with a large per cent. of base
are becoming more rich in silver, and the
carbonates are giving way to regular
ledges of quartz ores. The confidence that
miners have heretofore had in the district
is increased, as the certainty of continua-
tion in ledges is considered greater than
when mines produce carbonates. Several
of the mines that were at the surface out-
croppings of smelting ores, are now good
milling ores that will pay a large profit to
the miners when milled. In the first dis-
coveries, about two-thirds of the mines
were of a kind of ore that would smelt
most successfully, and many persons were
of opinion that the establishment of mills
would be hazardous on account of the
quality of the ores. Since that time, ex-
perts who have examined the ores have de-
clared that a great quantity of ore will
yield, by mill process and proper roasting,
a per cent. unequalled by any district in
Nevada. In the mineral belt of this dis-
trict there seem to be some places where
the smelting ores are very rare, and many
mines are being worked that are producing
silver and gold quartz with very little base.

Prospect of the Comstock Lode.

It is within the recognition of every citi-
zen of Storey County that the future of the
Comstock never looked more promising
than to-day. Recent developments seem to
have established the correctness of the the-
ory that the great Comstock vein is limit-
less in depth, and the cheering effect of the
discovery is beginning to be observed in
every avenue of trade and industry. While
some have contended that the bottom of the
deposit would in time be reached, others
have adhered to the opinion that, although
the vein might be without limit in depth—
being a true fissure vein—it would become
poorer in the precious metals as it descend-
ed, and finally become barren, or so nearly
so as to render the working of it profitless.
Neither of these opinions seems to be cor-
rect. Development has demonstrated not
only that the deposit is inexhaustible, but
that it is not an invariable rule that it be-
comes poorer in its lower depths. In some
of the mines, it is true, the ores have de-
creased in value with the depth, but this
has not been the case in every instance,
and the theory of gradual impoverishment
cannot be accepted in a general application
to the entire line of the Comstock. The
lowest depths reached are showing bodies
of ores as vast and valuable as were
found nearer the surface, and im-
proved machinery, which ingenu-
ity will apply as necessity requires, will
enable ores to be raised and profitably re-
duced at a depth ten times greater than has
yet been attained. Nor this only. The
Comstock lode has been traced a distance
of over two miles, yet not one quarter of
this length has been worked at all. It
abounds in great stretches that appear to
be barren. But are they really so? This
is a question which will in time be an-
swered. We do not believe them to be
barren. In formation the Comstock is ex-
ceedingly irregular. It has a general di-
rection and connection, but in some spots
it is rich near the surface, while a few
paces to the north or south it is barren at
the same depth. Like the billows of the
ocean, the rich deposits of the vein seem
to rise and fall, but the opinion is rational
that, somewhere along the vein, in every foot
of it, either at the surface or at the depths
of hundreds or thousands of feet, valuable
ores may be found. Extending from the
Gould and Curry to the Ophir, one of these
barren stretches is to be found, from which
but little ore of value has ever been taken.
A systematic search is now being made
along it, and we are not permitted to doubt
that the labor applied and money expended
will find abundant reward in the end. It
is this belief, strengthened by recent de-
velopments elsewhere along the line, that
warrants us in predicting a prosperous fu-
ture for Storey county.—*Virginia Enter-
prise*.

NUMBERS of Swiss emigrants are coloniz-
ing in Tennessee, and are going into the
manufacture of cheese, with all the neces-
sary implements for which they are fully
provided.

Iron and Wood Bench Planes.

We here give representations of improved styles of planes for carpenters' use, manufactured by the Stanley 'Rule and Level Company, of New Britain, Conn., who now offer them to the Pacific coast market.

In explanation of the ents, it may be said that the plane-iron is secured in position by the iron cap or lever, which has a cam with a thumb-piece at its upper end. A screw, passing down into the iron bed-pieces, serves as a fulcrum upon which the lever acts in clamping the plane-iron. The lever may be placed or removed at pleasure without the use of any tool, being properly slotted for the purpose; and the pressure required for the best working of the plane can be adjusted at any time by driving or slackening the central screw upon which the lever operates.

The thumb-screw, under the bed-piece, operates a simple device by means of which the plane-iron may be easily set forward or withdrawn, while it is clamped down to the bed-piece; and without removing the hands from the plane, or the plane from the work, any desired thickness of shaving

may be obtained with perfect accuracy. The iron bed-piece is attached to the stock of the plane by two screws; and can be moved forward or backward, sufficiently to open or close the mouth of the plane, as the owner may desire.

The plane-iron and the cap-iron are fastened together in the usual manner, by a screw passing through the center of each. The curve in the cap-iron being brought directly under the lower end of the clamping lever, while the plane is in use, the greatest pressure is exerted at the extreme cutting edge, and at a point about an inch back from the same, where the plane-iron is most likely to buckle, or rise from its bed. The remainder of the pressure is distributed from this point to the heel of the iron, in a manner which secures its perfect solidity upon the bed, and avoids any chattering.

These planes have stood the severest tests applied to them by practical workmen, and are becoming great favorites. A mechanic at Sacramento tells us that he has used a set for six months, and now wouldn't use any others. We consider the extended use of iron in these instruments as one of those steps in the march of improvements not likely to be retraced. The plane is an instrument almost as general in its use, as the hammer or saw, and which should occupy an important place among the tools of every farmer. Good tools are always the cheapest in the end. Hence recommend the above to the attention of both farmers and mechanics, and all who may desire such an instrument. Any further information, with regard to prices, etc., may be obtained by addressing the manufacturers, as above.

A DEADLY POISON.—It is acknowledged by some of the medical journals of the day that there is a poisonous compound so deadly and active, that a letter containing some of it in an imperceptible quantity, will cause the reader to fall dead almost instantly with all the symptoms of asphyxia. One or two well authenticated instances are recorded.

The Inventor of the Sewing Machine.

It is said that we are producing the astounding number of one thousand sewing machines every working day at an average cost to the purchaser of sixty dollars each. Sixty thousand dollars daily paid for this substitute seems almost incredible. Yet we are told that there are single establishments which employ over five hundred machines; we know that there are millions of families in the United States, most of whom have or intend to have one; and we cannot visit any city of large size in the civilized world without stumbling across the familiar article.

To the man whose face appears on this page, is due the credit of inventing the machine which annually saves millions of dollars in labor. Prof. Renwick said on oath, in 1860, that he believed the saving of labor then amounted to nineteen millions per annum.

Elias Howe, Jr., the inventor of this wonderful machine, was born at Spencer, Massachusetts, in the year 1819. As a youth, he

months he took a course which drove off his benefactor, and Elias Howe was left almost penniless in London, with a sick wife and three children in America.

After suffering extreme want, this inventor returned to America in 1849, with \$2½ in his pocket, to see his wife die. Among his friends again, however, he was enabled to get the means for a proper subsistence, and to war against the infringers of his patent right. Nine years after making his first machine, his right was legally established, and from that time fortune commenced to smile on him, and at the time of his death, Oct. 3d, 1867, he was a wealthy man.

While it has been proved incontestibly that Howe was the first inventor of the sewing machine, it is allowed that one or two others also invented a like machine, without knowledge of Howe's work, but at a later day; and that many valuable modifications have been since made. Yet it is agreed by disinterested and competent persons that Elias Howe, in his first machine, carried the invention farther on towards its

was considered a jolly fellow, disinclined to extra exertion or steady labor, and not at all of the stuff to make a hero of. Yet he passed through a most dramatic life, underwent the toils and privations reserved for the inventor and made the more poignant by the knowledge of the great yet unrequited merits of his device, and produced one of the revolutionizing inventions of the age. It is a satisfaction to know that he finally received his reward.

In 1843, he set to work to invent a machine which should do what his wife was obliged to do daily, and in 1844 he had made a model which would actually sew. Aided by a kind friend (for he was poor) who wished to help him and was not disinclined to make a sudden fortune,—by George Fisher, a coal and wood merchant of Cambridge, Massachusetts,—he completed in May, 1845, a working machine, one which could be put into a box of a capacity of a cubic foot and a half, but which could sew at the rate of 300 stitches per minute. But this mechanical success was far from being a financial success. Although he proved the utility of the device in practice and before the public, he could not sell a single machine.

Failing to introduce it in the United States, Elias Howe, with his brother, went to London, where a certain William Thomas bought a part right for a mere song and engaged his services. For the sum of \$1,250, William Thomas secured that which enriched him. Yet after a few

complete and final utility than any other inventor has ever brought a first-rate invention at the first trial.

Among the late inventions of importance the "Mill's Treadle" must be mentioned. Many objections have been made to the use of the sewing machine by women, on the ground that physical injury results only too often. The treadle in question, which is attached to the Howe machine, according to the positive certificates of many prominent physicians of this city, entirely obviates the objections mentioned, and must therefore be awarded an important place in the history of the machine.

The sewing machines now offered to the public are really wonderful. They perform nearly all that the needle ever did. They seam, hem, tuck, bind, stitch, quilt, gather, fell, braid, embroider and make button holes. They are used in the manufacture of every garment worn by man, woman or child, from the stoutest to the most delicate. A very interesting collection of shoes, gaiters and lady's boots was sent to the Paris Exposition. There were all degrees of delicacy, from the stout Balmoral to the boot of kid, satin or velvet; and every kind of stitch had been employed in their manufacture. Some of the stitches were so small that they could not be distinctly seen without a magnifying glass, and some of them were as coarse and strong as those of men's boots. The special wonder of the display was that every stitch in every one of the beautiful shoes was executed by the machine,—by what is called the "Howe Sewing Machine."

We could speak at much greater length of this device, of its capabilities, its great

utility, the saving of labor which it effects. But we have no space for more. Among the literature on the subject may be mentioned a most interesting article contributed some years ago by James Parton to the *Atlantic Monthly*, which we have used in part in our remarks.

New Books.

SCENES OF WONDER AND CURIOSITY IN CALIFORNIA.—Illustrated with over one hundred engravings. A Tourist's Guide to the Yosemite Valley, etc. By J. M. Hutchings. New York and San Francisco. A. Roman & Co., Publishers, 1870, 8vo. pp. 232.

In this handsome little volume, Mr. Hutchings has managed to give very much of interest concerning the beauties and wonders in our State, described in a pleasant manner and handsomely illustrated. The book is well suited for a place on the parlor table, and will help to give a better idea of what there is on there on the Pacific coast to allure travelers. We could make many an extract, in order to give a clearer idea of the book, had we the space, and we open it at random for one—a short one. We hit upon an illustration of how the big tree was cut down in the Calaveras grove.

"This tree employed five men for twenty-two days in felling it—not by chopping it down, but by boring it off with pump augers. After the stem was fairly severed from the stump, the uprightness of the tree and breadth of its base sustained it in position. To accomplish the feat of throwing it over, about two and a half days of the twenty-two were spent in inserting wedges and driving them in, until at last the noble monarch of the forest was forced to tremble and then to fall, after braving 'the hattle and the breeze' for nearly 3,000 years. In our estimation, it was a sacrilegious act; although it is possible that the exhibition of the bark among the unbelievers of the Eastern part of the continent and of Europe may have convinced all the 'Thomases' living that we have great facts in California which must be believed sooner or later. This is the only palliating consideration with us for this act of desecration."

THE ARCHITECT'S AND BUILDER'S POCKET Companion and Price Book, etc. By Frank W. Vogdes, Philadelphia, Henry Carey Baird. 1871. For sale by A. Roman & Co., S. F.

This convenient little book is designed to afford to the building fraternity those facilities and advantages provided for civil and mechanical engineers by similar works. It is neatly and carefully prepared and has very much of practical utility to architects and builders. It contains a short but comprehensive epitome of decimals, duodecimals, geometry and mensuration; with tables of U. S. measures, sizes, weights, strengths, etc., of iron, wood, stone, and various other materials, quantities of materials in given sizes and dimensions of wood, brick and stone; a full and complete bill of prices for carpenter's work; and rules for computing and valuing brick and brick work, stone work, painting, plastering, etc.

A COMPLETE GUIDE FOR COACH PAINTERS. Translated from the French of M. Arlot, Coach Painter, for eleven years Foreman of Painting to M. Eherler, Coachmaker, Paris, by A. A. Faquet, Chemist and Engineer. To which is added an appendix, containing information respecting the materials and the practice of coach and car painting and varnishing in the United States and Great Britain. Philadelphia, Henry Carey Baird. London: Sampson Low, Son, & Marston. 1871. 8vo. pp. 173. Price \$1.25. For sale by A. Roman & Co., S. F.

This excellent work cannot fail to be appreciated by the class for whom it is intended, being so pregnant with useful information for every day practice. There is no attempt at literary execution, but facts are given in a clear, comprehensive and impartial manner. In addition to the matter furnished by the French writer, a large amount of valuable material is given touching the practice of the profession in our country and Great Britain, which adds very largely to its great usefulness for American builders. Mr. Baird says in his preface:—"The undersigned cannot withhold an expression of the pride and satisfaction with which he, as a friend of American Industry, welcomes the day on which he is able to print such facts as are here given in regard to the successful establishment of the manufacture of the finer qualities of varnishes in this country. The industries are the mile-stones along the grand highway which leads to true civilization and National Power and Independence."

RECEIVED, to be noticed next week: Report of the Regents of the N. Y. State University; Iron Railway Bridge designs, of Phenixville Bridge Works; Bicknell's Village Builder.

DOMESTIC ECONOMY.

Artificial Appetites.

The tone of the stomach may be destroyed by insensible degrees—that is, without the individual experiencing any pain or any considerable uneasiness. Most people think their own experience or appetite the best test in regard to the fitness of any suitable food for their own use; and yet it is a well established fact, and patent to every medical man, that oftentimes things which appear to set well on the stomach, really produce very important disturbances, if not in the stomach, at least elsewhere in the system. In fact, the “tone of the stomach” may thus be entirely changed or destroyed. Such a condition of that organ is often caused by an excessive use of spices and stimulants of various kinds. It is thus that the taste for putrid food, to which we made reference last week, is acquired.

In support of the position that many of our tastes in civilized life are artificial rather than natural, it is quite common to refer to the same thing in domestic animals, who are taken away from the teachings of nature, and compelled to acquire artificial tastes and appetites, in order to render them more useful to man. Cows, sheep and horses are thus, in some places, as a matter of necessity, economy or convenience taught to eat fish—which, in their natural state, they will not touch.

As an instance, in case of the horse: Many years ago, when hay was scarce in the upper portion of Michigan, and along the shore of Lake Superior, the settlers were compelled to feed their animals, even horses, upon fish; and it is related of this region by Capt. Maryatt, in his “Diary,” page 55: “You will see horses and cows disputing for offal; and our landlord told me that he had often witnessed a particular horse wait very quietly while they were landing fish from canoes, watch his opportunity, dart in, steal one, and run away with it in his mouth!”

GREASY FOOD.—Hamilton, in his “Men and Manners,” makes a remark, the truth of which must strike every thinking man who has witnessed the propensity for grease which is so common among Americans generally. “The national propensity for grease,” he says, “is inordinate. It enters largely into the composition of every dish, and constitutes the sole ingredient of many. The very bread is, generally, not only impregnated with some unctuous substance, but when sent up to the breakfast table, is seen to float in a menstrum of oleaginous matter.

This is floating toast, we suppose, which some people fish for with a fork, or a spoon, in an ocean of butter. Luckily he has said nothing of the ‘short bread’ and ‘puddings’ stuffed with grease; and of the Yankee ‘doughnut’ fried in grease. In Alabama they grease everything with pork fat. Even bacon swims in pork grease. The negroes actually drip with greasy perspiration.”

Milk and Its Adulteration.

The climate and season of the year have much to do with the amount of milk rendered by each animal; those contingencies also materially affect the nature and composition of the milk. In hot and dry seasons the quantity is less, but the quality is richer. Cold weather favors the production of sugar and cheese in milk, while hot weather increases the yield of butter.

An animal milked three times a day will yield a larger quantity than one milked twice, and more at two milkings than one in a day. But milk drawn but once a day is richer than that drawn thrice or twice.

From these observations it will be seen that the detection of adulterated milk is extremely difficult. The truth can be comparatively reached by ascertaining the minimum density of pure milk, and seeing whether the density of the suspected samples be above or below that. A lactometer—the instrument employed to determine the density,—costs but a trifle, and any child that can read figures can be easily taught to use it. By the use of such an instrument, a standard degree of specific gravity can be fixed, up to which all must come, and down to which anyone may adulterate, without detection.

Milk is variously adulterated—by the addition of water, chalk, starch, gum, etc.,

or by the extraction therefrom of cream. When water is added or cream extracted, the fluid has a bluish, flimsy look, which the adulterator endeavors to mask by the addition of chalk, starch, or a peculiarly prepared gum. The lactometer fails, for reasons well known to the expert, to detect, with any degree of certainty, any of these adulterations; but they can all be detected and their quantity determined by careful chemical examinations. The cost of such examinations, however, preclude their general practicability.

HOW TO DETECT WINE MADE FROM CIDER.—Evaporate slowly a small quantity of the suspected wine to dryness; then gradually expose the residue to a slightly increased temperature, and if it has been made from cider or largely adulterated therewith, a peculiar smell of baked apples will be apparent.

HOW TO DETECT CHICORY IN GROUND COFFEE.—Pure coffee when sprinkled on the surface of water, remains there for sometime, and does not sink; but if chicory is present it will almost immediately sink, and tinge the liquid a brownish yellow. Again: Chicory contains so much gummy matter that if the fingers be moistened, and a little of the suspected coffee be taken up between them, and well pressed together it can be moulded into a slightly adhering plect, while pure coffee will not adhere at all.

Sugar, Starch, Etc.

Sugar and starch have very nearly the same chemical composition, but in some of their physical properties they are very different. Sugar is soluble in water, while starch is only diffusible through it. Sugar undergoes the process of fermentation, starch does not; sugar has a sweet taste, starch is almost tasteless. Starch, however, is convertible into sugar, and then assumes all the characteristics of other sugar, being capable of fermentation and of thus being converted into alcohol.

It is converted into sugar by the juices of the mouth and stomach, and this is the first process of digestion, with starch. Sugar, therefore, is more quickly prepared to be absorbed into the blood, and better adapted as a heat-giver for the young, and in warm weather, when the digestive organs are enfeebled. This is indicated in children by the almost universal love which they manifest for food containing it, and Nature furnishes it in the milk of all animals, and in the summer in fruits and berries and green vegetables, clearly indicating the importance and the appropriate use of sugar.

Sugar assumes three different forms in common articles of diet, which are very nearly alike in chemical composition, and have also the same peculiarities. These are called cane sugar, grape sugar, and milk sugar.

They vary in composition as follows:—

	Carbon.	Hydrogen.	Oxygen.
Cane Sugar.....	12	10	16
Grape Sugar.....	12	12	12
Milk Sugar.....	11	12	12

They are all alike sweet and soluble in water; but the cane and milk sugars differ from the grape in that they do not ferment till they have first been converted into grape sugar.—*Philosophy of Living.*

Sugar is found in almost all plants at certain periods of their growth and development. It circulates largely in the sap of trees and plants, just before they unfold their buds, and in some species—as the maple—in such quantities that the sap is drawn off for the manufacture of sugar.

Vegetables also contain more or less sugar, as the beet, the melon, etc. All grasses contain sugar just before the seed is formed, but it is nearly all used up by the plant in forming the seed; hence the importance of cutting grasses in the bloom. By so doing, the sugar is retained in the stalk for the use of the cattle. If allowed to go into the seed, it would be converted into starch, which, though almost identical with sugar, as shown above, is much less nutritious. The sugar cane is nothing but a huge grass, and holds the same relation to other grasses, in the amount of sugar which it contains, as the maple does to other trees. If the cane was allowed to ripen its seed, it would contain very little or no sugar.

Domestic Receipts.

TO PREVENT MOULD.—It is a remarkable fact, not as generally known as it should be, that mouldiness is effectually prevented by any kind of perfume. Paste strongly impregnated with any of the essential oils will not become sour or mouldy. Books will not become mouldy in the presence of Russian leather.

SURE DEATH TO BED BUGS.—Take a teaspoonful of quicksilver, beat it up with the whites of two eggs, as for frosting, till the two are thoroughly and finely united, then apply with a feather to every crack or crevice in the bedstead or wall, where a bed bug can hide. Repeat it three or four times, and your work is done for two years at least.

TO MAKE A CANDLE BURN SLOWLY.—When, as in case of sickness, a dull light is wished, put finely-powdered salt on the candle, till it reaches the black part of the wick. In this way a mild, steady light may be kept through the night by a small piece of a candle.

ICING FOR CAKES.—Take of the best white sugar one pound, and pour over it just enough cold water to dissolve the lumps; then take the whites of three eggs, and beat them a little, but not to a stiff froth; add these to the sugar and water; put it in a deep bowl, place the bowl in a vessel of boiling water, and beat up the mixture. It will first become thin and clear, and afterward begin to thicken. When it becomes quite thick, remove it from the fire, and continue the beating until it becomes cold, then spread it on with a knife. It is perfectly white, glistens beautifully, and is so hard and smooth when dry, that you may write very well upon it with a pencil.

HOW TO KEEP BUTTER SWEET.—It is the easiest thing in the world. Simply put it in clean jars and cover with a strong brine. This will keep pure butter a year, fresh and sweet, as we know by experience. It is almost equally good to put in oak casks, headed tight. This is equivalent to canning fruit. The brine, in case of jars, acts as a heading, keeping the air out. Butter to be thus preserved should be made properly. The buttermilk should be thoroughly worked out till you have only pure “beads” coming out as clear as rain water. Care should be taken, however, not to work so much as to destroy the “grain,” else your butter will be tough, and “heavy” in winter and “greasy” in summer. Such butter cannot be kept in good order for any length of time by any possible expedient.

Mechanical Hints.

HOW TO STRAIGHTEN SAWS.—If the saw has a “back” take it out by placing it between two pieces of wood in your bench-screw, and knocking the back with a piece of hard wood from the end that comes up to the handle. Take the the blade, and see where the buckle is in the front; it wants hammering upon the back of the blade upon a smooth flat iron or anvil, with a smooth-faced hammer, commencing from the back in a line with the centre of buckle, in this wise: one blow outside edge, then so that the blows may fall in a triangle, then one, two, three, a little farther; and by taking particular notice of the effects of each blow you will very soon find out where to expend your labor to the greatest advantage to obtain your end. Do not hurry, but take it quietly. It is a thing that has puzzled a great many, but nothing is easier, with a few effective blows well directed. But one in the wrong place and you may put four cross buckles where there was only one; if you lose temper and hit at random, your saw will be spoiled.—*Cabinet Maker.*

THE RAILWAY CAR is the advanced and improved form of carriage. It represents in its finest forms what may be called the highest degree of perfection of the carriage. The other extreme is probably best illustrated by the old-fashioned drag which is merely a frame of wood that is drawn along bodily on the ground. An interesting paper might be written on the gradual development of carriages from the drag to the finest approved silver palace car. Upon the application of steam to traveling purposes, the ordinary stage-coach first answered the place of a vehicle. Then a train of coaches became necessary. Then as the train grew longer, several coaches were united, but they still retained their old form of construction and the same arrangements of wheels. One by one these original traces of the coach disappear, the wheels were placed on trucks, the framework of the body was changed, and now the railway car is essentially original.

LIFE THOUGHTS.

The greatest of all mistakes is to live for time, when any moment may launch us into eternity.

Success rides on every hour—grapple it and you may win; but without a grapple it will never go with you.

Never ridicule sacred things, or what others may esteem as such, however absurd they may appear to be.

Never show levity when the people are professedly engaged in worship.

Work is the weapon of honor, and he who lacks the weapon will never triumph.

Always take the part of an absent person who is censured in company, so far as truth and propriety will allow.

Borrowed garments seldom fit well. Haste often trips up its own heels. Men often blush to hear what they are not ashamed to do. What is not needed is dear at any price.

It was a saying of Socrates that every man had need of a faithful friend and a bitter enemy; the one to advise, the other to show him his faults.

A man should never put a fence of words around his ideas, because many who would otherwise give him a fair hearing, lack resolution to climb over such a rugged enclosure.

They who doubt the truth of religion because they can find no Christian who is perfect, might as well deny the existence of the sun because it is not always noonday.

He who waits to do a great deal at once, will never do anything.

Men who Live Forever.

Mr. Beecher, in a recent sermon, said: “Men who establish academies, colleges, universities, live forever, and live, too, in a way that an angel might be proud to live. They who established Harvard—who, with heavenly arithmetic, can compute what their money has done since they have gone home? Is the name of Yale not familiar to every intelligent man on the continent because he endowed that college? His name will be carried down thousands of years. Cornell’s name is rescued already. Vassar’s, Astor’s and Drew’s names would not have sounded far down, had they not a due inspiration that taught them to found seminaries for the discovery and propagation of knowledge among the masses of men. And this is the reason, I say, that men ought not to be poor if they can be rich. There is a power in wealth when it is guarded by benevolence which should not be despised. Having such a sword as that with which to slay ignorance, no man ought to refuse to draw it from its sheath. Whoever can organize wealth and endow institutions of learning, is using wealth to a good purpose. We may rise to a higher grade and to more familiar ground, since it is more frequently inculcated in the pulpit. As virtue and spirituality are higher than physical qualities, as the wealth of society lies more in the goodness of Christian families and Christian institutions than in ease, or abundance, or pleasure, so the most worthy prolongs his life to an afterday, who so lives as to give force and perpetuity to spiritual influences.”

A WORD TO BOYS.—Truth is one of the rarest virtues. Many a youth has been lost to society by allowing falsehood to tarnish his character and foolishly throwing truth away. Honesty, frankness, generosity, virtue—blessed traits! Be these yours, my boys, we shall not fear. You are watched by your elders. Men who are looking for clerks and apprentices have their eyes on you. If you are profane, vulgar, saloon going, they will not choose you. If you are upright, steady and industrious, before long you will find good places, kind masters, and the prospect of a useful life before you.

COURAGE IN EVERY-DAY LIFE.—Have courage to discharge a debt while you have the money in your pocket.

Have the courage to do without that which you do not need, however much your eyes may covet it.

Have the courage to speak your mind when it is necessary you should do so, and hold your tongue when it is prudent you should do so.

Have the courage to make a will and a just one.

Have the courage to tell a man why you do not lend him your money.

Have the courage to “cut” the most agreeable acquaintance you have, when you are convinced that he lacks principle. “A friend should bear with a friend’s infirmities,” but not his vices.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third time. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier. You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,

Economy in the use of Oil,

Freedom from Smoke or Smell,

Reliability in Wind and Motion,

Coolness of Burner and Oil Cup, and

Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the

Complete Satisfaction it Gives

to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render all other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous.

Please favor us with your orders PROMPTLY, and oblige

Chicago Manufacturing Company,

*Thermometograph. †Rain.

REMARKS.—In our observations last week we encouraged the hopes of a speedy fall of rain, in which we have not been disappointed, as our table shows. Although partaking of the character of spring or April showers, of circumscribed extent, still about an average of an inch has fallen over the greater part of the agricultural region of the State, which is enough to relieve the present needs of the growing crop. In only one season (1856-57) of the past 21 years has the rain failed in April; so that if we receive but half the average of this month, which is one and a quarter inches, and are spared by the fierce north winds, a reasonable harvest may yet be expected.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth, price, (very low) post paid, \$1.00, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

AN INTELLIGENT NOTICE.—The *Deutsch-Am. Gerber* und *Industrie Zeitschrift*, Philadelphia, New York and Leipzig, gives our enterprise the following credit: "The SCIENTIFIC PRESS is really one of the richest in matter of the Anglo-American technical journals. In its department of 'Mechanical' and of 'Scientific Progress' it gives rich and well chosen selections. In its department of 'Correspondence' it adds very considerably to a better knowledge of the country, and particularly of the mining industry. In its 'Mining Summary' the journal gives a careful review of this subject as far as concerns the Pacific Coast and, in part, the West. Under the headings of 'Agricultural Industry' and 'Household Reading' very useful and complete matter is again given; likewise in its miscellaneous is very much of interest, as, for example, concerning railroad matters, patents, inventions, etc., together with illustrated descriptions of inventions and the like."

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$6 piece in a registered letter, in which case we will be responsible for its safety.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the *Scientific Press*, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Caution.—Eagle Quicksilver Mining Company.—Location of mines, Eagle Mining District, Santa Barbara County, California.

Notice is hereby given to the public not to purchase or negotiate for the following named shares, designated by the names of the delinquent owners in the Eagle Quicksilver Mining Company by law, and the articles of agreement provided. They were duly advertised and sold in full at public auction, by John Middleton & Son, auctioneers, on Monday, the 10th day of April, 1871, for delinquent assessments thereon and accruing costs of advertising and sale, and will not be transferred by said company.

Names. Shares sold.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE Ransom Patents, the most perfect SANDSTONE, specimens of which may be seen in the ornamentation of Dr. Stone's Church, now in course of erection, at the corner of Post and Mason streets. For architectural, ornamental and mechanical purposes, this stone surpasses all natural stone of its class.

GAINSTONES from this factory, which we make of any desired size, may be seen at many of the great mechanical shops in this city, where they are held in high esteem.

The factory is now turning out Architectural Stones, Cemetery Stone, Grindstones, Garden Ornaments, in the way of Vases, Fountains, etc. The nature of the art admits of our moulding the stones in any desirable form, and enables us to compete successfully with all stone wrought by hand. In England, where the stone has been manufactured largely for the past fifteen years, it is considered, for durability and strength, to surpass the best English Sandstone. The British Government employs it largely in its public buildings, both at home and in its Colonies; and as we have secured the services of MR. ERNEST L. RANSOM, late Superintendent of the home works at Greenwich, England, we are turning out stone fully equal to the English standard.

For particulars, apply at the Factory, corner Turk and Larkin streets. ma18-tf

IMPROVEMENT IN

HUBS AND AXLES.

This new patent is for an improved manner of uniting the steel spindle, I, with the iron portion of the axle, J, with the double collar, K, and also in the formation of a sort of hub on the holding-nut, F, which hub can be shortened so as to bring the new collar, and thus compensate for any end wear of the box; also in the use of secondary steel boxes, A, C, within the main axle-box, B, and a series of oil-cups, C, d, arranged on the hub and an outer nut, which opens at various points within the box. A cap and protecting-ring are secured at the outer and inner ends of the hub, respectively, to protect from dirt.

An operative model and full description are necessary to show fully all the merits of the invention. The patentee can prove the value of the invention from actual working; that it is an easy mode of construction and furnishes a durable and more complete hub and axle than any other that has yet been devised.

The attention of Manufacturers is solicited. All persons are cautioned not to infringe on the above patent under penalty of the law.

CARLES R. DONNER, Inventor and Patentee, Sonoma, Cal. apl6-m

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for Lea & Perrins' Sauce, and see that their name is upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcester-shire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see names on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Croese and Blackwell, London, &c., &c., and by Grocers and Others universally. Agents: CROSS & CO., San Francisco. 1v22-lycow

Ahead of the World.

THE NEW TREADLE POWER,

Just Invented, and used exclusively on the HOWE SEWING MACHINE.

EXCELSIOR IMPROVED DOUBLE-ACTING SUCTION AND FORCE PUMP.
HOOKER'S PATENT. August 13, 1865, and January 15, 1867.

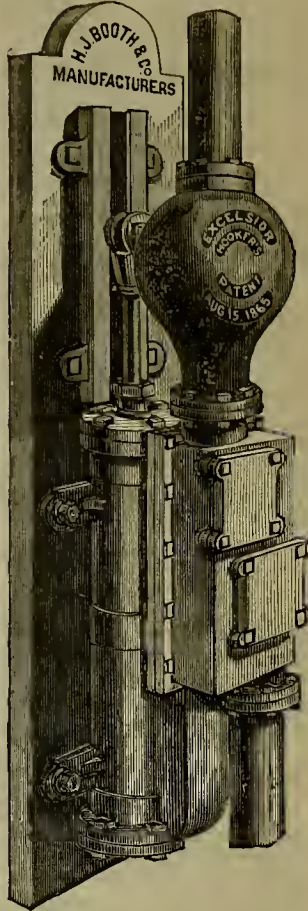

IT IS WELL KNOWN THAT THE EXCELSIOR PUMP IS THE BEST ARTICLE IN THE MARKET FOR ALL PURPOSES. IT BEING FITTED FOR ANY KIND OF POWER AND ALWAYS RELIABLE EVERY PUMP IS WARRANTED.

FOR DOMESTIC USE FIRES OR IRRIGATING PURPOSES IT IS FAR SUPERIOR TO ANY OTHER PUMP.

STANDARD DURABLE AND PERFECT AND SUBSTANTIAL IN EVERY RESPECT.

We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pumps of equal caliber. It has Poppet Valves, which can not be wrongly placed in the Pump. The Fair of the Mechanics' Institute, held in the city of San Francisco, awarded the owners of this Pump, for its SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Suitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. See circular for particulars.

General Agents.—MESSRS. BRITTAN, HOLBROOK & CO., 111 and 113 California street, and 17 and 19 Davis street, are Agents for the sale of the Excelsior Pump, who make liberal discount to the trade. H. J. BOOTH & CO., Union Iron Works, First Street, corner of Mission, San Francisco, who manufacture and have the sale of the Excelsior Pump.

V. CUSHING, Proprietor, San Francisco.

We have BRASS-LINED, BRASS PISTON and BRASS VALVE PUMPS, at greatly reduced prices. Also STEAM PUMPS.

The California Powder Works

No. 314 CALIFORNIA STREET,

Manufacturers and have constantly on hand
**SPORTING,
MINING,
And BLASTING
POWDER,**

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m
JOHN F. LOHSE, Secretary.

A NEW ARTICLE.

Composition Pipe for Conducting Water.

The attention of Railroad Companies, farmers, dairymen and others, is called to our new Pipe for leading water. It is lighter than ordinary lead pipe, and much cheaper than iron, will stand a heavy pressure, and deliver about one-third more water than iron pipe, provided the sizes are the same.

We are now manufacturing all sizes, from half-inch to two-inch, and can fill large orders at short notice and put on reels for shipment, the same as lead pipe.

Samples can be seen at our office.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

Commission,
AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known to
require any lengthy description;
the following are the main points
of advantage.

We guarantee a saving of
75 PER CENT OF OIL.

They are composed of a transpar-
ent Glass Cup, mounted in Brass,
provided with a hollow tube, inside
of which is placed a loose acting
solid or hollow wire, which acts as
a Feeder and Regulator. The wire
rests constantly upon the Journal,
thereby acting with the bearing in
its motion. The wire is so regu-
lated inside the tube as to feed ac-
cording to the demand only. There
is no flow of oil whatever while the
machinery is not in motion.

They are as reliable in Winter as in Summer.
Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' con-
stant use.
They are constructed in a very neat and substantial manner.
We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give
perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position
or upon an angle of 45 degrees. Permit the Rod to rest upon the Journal, and have a perfectly free action. If you
desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal
that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed
NATHAN & DREYFUS, New York, Jan. 1st, 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several im-
portant improvements have been made
and two additional patents obtained
we feel justified in recommending it
to all parties using Steam power, and
warranting it to be the most perfect
regulator in the market.

The Gardner Governor is so well
known that we think it unnecessary to
enter into a detailed explanation of the
principles involved, or details in its
construction, merely giving the leading
objects realized by this important in-
vention. The Governor combines with
the greatest simplicity of construc-
tion, accurate regulation of speed, pos-
itive insurance against all accidents
liable to occur from slipping or parting
the Governor or driving belt, and a
convenient arrangement for adjusting
the speed of the Engine while in mo-
tion, without change of pulleys.

The construction of the Governor is
extremely simple, having no springs,
inside joints, swivels or parts liable to
disarrangement, all the several parts
are duplicates of each other in the same
series; the most skillful workmen are
employed, the best material used and
the machinery employed especially
adapted to their manufacture. Thus

We warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheer-
fully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.
When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either
BLACK OR FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup
to the public, we desire to call
very particular attention to its
many special advantages.

FIRST.—Nothing but clean oil or
tallow is admitted into the Cyl-
inder, no lime or sediment of any
kind.

SECOND.—Its great economy of
both tallow and fuel.

THIRD.—It is self-acting, and
supplies the lubricating material
only while the Engine is in
motion.

FOURTH.—Its certainty and regu-
larity of feeding, and increase of
the power of the Engine.

The principle upon which this
apparatus is founded is that, in-
stead of admitting tallow into the
Cylinder in considerable quantities
at uncertain intervals by means of
tallow cups, grease cups, and other
crude contrivances, and allowing
it to be instantly blown out at
the exhaust (as must necessarily
be the case), this cup, by its pecu-
liar action, delivers the lubricant

in drops into the body of the
steam, which thereby becomes
thoroughly impregnated or greased
before passing into the steam chest
or Cylinder; the consequence is,
that instead of falling to the bot-
tom of the Cylinder, as it does
when admitted through a tallow
cup (which passes the lubricant
from the bottom of the cup to the
Cylinder), it enters into the form
of minute globules, and hence the
whole of the internal parts of the
engine become regularly and con-
stantly greased. The result of its
action has been proved in a very
great number of cases to be an
enormous saving of tallow, a con-
siderable increase in the power of
the engine, a great saving in fuel,
and reduction of internal friction
to a minimum.

These Lubricators will save you
75 per cent. of the Lubricating
Material, and cost no more than
the common Compression Cups.

The above Goods are Sold at
Factory Rates.

For Price Lists or information address DARLING & Co., 629, Washington Street,

San Francisco, California.

**Richardson & Co., Copper Ore Wharves,
SWANSEA.**

RICHARDSON & Co. have been for thirty years established
in Swansea as Agents for the preparation, Sampling, Assay-
ing, and Sale of Copper, Silver, Gold, Lead, Zinc, and all
other Ores and Metals, for which they have extensive Ware-
houses and Wharves under cover, 1,000 feet of Quay Front-
age within the Floating Dock, and the most complete Ma-
chinery and Appliances. They are also prepared to make
advances against Ores in anticipation of realization, and to
guarantee all payments when required. 5v22-lyrs

LOUIS FALKENAU,

STATE ASSAYER,

Analytical and Consulting Chemist,

421 Montgomery St. up stairs.

Particular attention given to the Analysis of Ores,
Minerals, Metallurgical Products, Mineral Waters,
Soils, Commercial Articles, Etc.

One or two pupils can receive theoretical and prac-
tical instruction in Assaying, Analysis, or any particular
branch of Chemistry at the laboratory. 11v21-3m

NEVADA METALLURGICAL WORKS,

Ores Crushed, Sampled and Assayed.

Having added Pans, Assay office and Chlorination A p-
paratus to our establishment, we are now prepared to
make working tests by any process, assay ores and pro-
ducts. Returns guaranteed. Answers to all metallur-
gical questions given. 25v21-3m

Dewey & Co., U. S. and
Foreign Patent Solicitors
and Counsellors, Scien-
tific Press Office.
Principal Agency
in the Pacific
States. Es-
tablished
1860.

Plate V of Illustrated Mechanical Movements, described in Dewey & Co's 48 page circular of Information for Inventors. Sent post paid on receipt of stamp.

Patent claims for Pacific Coast Inventors fully secured in less time than through any other agency in the United States, and at less cost. If you think you have a valuable invention, consult none but the best and most reliable counsellors. They will obtain a valid patent if new, or save you expense, if old, by giving you honest and intelligent advice. All business relating to patent soliciting transacted confidentially and thoroughly.

DEWEY & CO.,
Patent Agents, No. 414 Clay st., San Francisco.

BAIRD'S

BOOKS

FOR PRACTICAL MEN.

My new revised and enlarged Catalogue of PRACTICAL AND SCIENTIFIC BOOKS, complete to April 15, 1871, 94 pages, 8 vo., will be sent, free of postage, to any one who will favor me with his address.

HENRY CAREY BAIRD,
Industrial Publisher, 406 Walnut St.,
Philadelphia.

Hubbard, Lippencott, Bakewell & Co.,

MANUFACTURERS.

J. E. Emerson's New Patent Flange Toothed Circular Saws, are superceding all others.

Crosby's Patent Gang Saw Buckle; Lippencott & Tuttle's Patent Cross Cut Saws; Davis' Patent Double Cut Gang Saws (cuts both ways); and all of the celebrated brands of SAWS formerly manufactured by both HUBBARD BROS. & CO. and LIPPENCOTT & CO.

Also, SHOVELS, AXES AND SPADES.
All orders from the Pacific Coast will receive special attention and be forwarded with dispatch.
Our extensive facilities enable us to furnish our Goods at the

Lowest Market Prices,

And all Warranted of SUPERIOR QUALITY.

Two Free Universities.

Whatever may be thought or said of the character of the late Horace Hawes, so much must be placed to the credit of his intentions,—that he was the first Californian who has ever given a large sum of money, or its equivalent, to the public. With his death commences a new era for our coast—the era of public bequests.

The property which Mr. Hawes donated, although it has yielded but a small income, can be made by proper management, we are told by one of the trustees, to return a very large revenue. There are some rumors, however, that the will is to be contested. As to whether the extra outside amount will be raised, we are exceedingly doubtful. But there is a number of persons sanguine that before long California will be able to boast of having two free universities.

The boast certainly sounds well. We have no objection to it. But the important question occurs as to whether it will be anything more than a sound. We have already one free university, for which the legislature has made large provision. Yet the institution appears to be crippled by want of more funds, and the youth of California are by no means rushing to its halls in such numbers as to crowd them. Indeed, the Regents have been obliged to have recourse to preparatory courses and outside lectures, in order to get sufficient names to make a respectable showing in the catalogue.

Whether Mr. Hawes had a mistrust as to the future of our State University, we know not. That his intentions were excellent, we are willing to agree. But that it is wise or even of the slightest practical utility to set up a new university on every possible pretence, we do not believe. One well-endowed institution will be amply sufficient for this State for the next hundred years. We have a proposition to make for the consideration of future university founders. If they desire to set up distinct institutions, let them found colleges in connection with our present university, to be managed somewhat after the manner of the various colleges which, at Cambridge and Oxford, England, go to make up a grand university. We hope some day to see this idea practically carried out.

The McCormick Prize Mower.

We have previously spoken of the McCormick harvesting machines, which have made such a revolution in farming operations within the past twenty-three years. About a month ago we gave an illustration of the "Advance" reaper and mower. Today we illustrate another machine of Mr. McCormick's, which is called the "Prize" mower.

This mower is identical with the "Advance" when stripped of its reaping parts. It is a two-wheeled machine, cuts a four-foot swath, and its cutting power, it is said, cannot be choked by the worst of matted

nature of the ground, and regulated so as to bear up all the weight of the frame behind the wheels and yet keep the cutter-bar within an easy bearing on the ground, while at the same time it communicates an easy, pleasant motion to the machine when working on rough ground.

There are other points which might be dwelt on, but the best description of the mower is the machine itself and its practical working. For further information on these points, address C. H. McCormick & Bro., Chicago.

A Pleasant Reception.

The Mechanics' Institute, which, under the lead of its energetic President, Mr. A.

the Institute for its warm greeting, and complimented the coast on having such a society. Referring modestly to himself, he claimed to be in certain respects a pioneer Californian, having built the first American steamer, the California—still in service—which ever entered the Pacific Ocean, and the first to enter the Golden Gate, and having been ever since interested in enterprises connected with the State. Mr. Webb also built the first American steamer ever crossing the Pacific Ocean, the Colorado, the pioneer vessel carrying our mails to China, as also the connecting steamers on both sides of the continent. Mr. Webb's remarks were warmly applauded.

Mayor Selby was then called on and responded. It is the first time that we remember when our chief city officer has made a speech, he being more given to deeds than to words. He spoke, as he acts, quietly but to the point. He referred to the want of manufacturing establishments on our coast, and to our preeminent advantages therefor, dwelling on the special advantage of our favorable climate,—a matter of very considerable importance. Alluding to Mr. Webb, he said that we needed the presence of such a man, whose vigor, intelligence, experience and wealth can do great things for the coast, while realizing himself a handsome profit for his labors and ventures.

Collector Phelps, an excellent man for

such an occasion, followed in a few eloquent remarks. Mr. H. F. Williams then spoke at some length. Mr. Irving M. Scott made one of the best speeches of the evening, representing the iron interests of the coast, and telling how we could now assist by our mechanical skill in such enterprises as those of Mr. Webb. Mr. B. Hyde spoke for the inland transportation interest, and then Mr. Diekey, a ship-builder, recently from Scotland, concluded with interesting remarks, giving good, sound facts.

After the speeches, greeting by the American hand-shake was given to Mr. Webb by a large number of those present.

IRRIGATION.—The Woodland Ditch Company have opened their old ditch, and farmers along the line of it are supplied with water for irrigation at the rate of \$4 per foot for 24 hours.

THE PRIZE MOWER AT WORK ON STEEP LAND.

grass. It is geared high and cuts clean and clear with the horses on a slow walk. The cutting apparatus has been proved by the severest tests.

The Prize mower is supplied with all the usual conveniences of levers, and is the only one which has the tilting lever. By this arrangement the edge of the cutter can be set at any angle desired, in a moment, and without dismounting from the seat. This is invaluable in preserving the edge of the knife while cutting over rough, stony ground, dead furrows, gullies or sandy soil, as will be appreciated by those who are conversant with such machines.

Another peculiar feature is the frame spring, which does away with the old plan of having a small roller or wheel behind the shoe, and enables one to get rid of the clogging dirt and cut grass. By means of a nut on a long-threaded screw, this spring can be made stiff or limber to suit the

S. Hallidie, is ever alive to assist in the important events of the day, gave a very pleasant reception on Wednesday evening, to Mr. W. H. Webb, the distinguished mechanic, the chief of American ship-builders. This gentleman coming to our shores, as Mr. Hallidie remarked, not as a sight-seer or critic, but to establish and consummate a great enterprise, an enterprise which binds nation to nation, and by its intercommunication develops industrial resources, latent wealth, and a high civilization, it was proper that the Mechanics' Institute of the Pacific coast should greet him, a fellow citizen, a fellow mechanic, with a warm, hearty welcome.

Mr. Hallidie, in brief but well chosen terms, welcomed Mr. Webb in the name of the Institute. He alluded to the guest's high position, and to the nobility of the mechanic's calling. Mr. Webb replied in a very appropriate manner. He thanked

MECHANICAL PROGRESS.

HYDROSTATIC PRESSURE ON STEAM VESSELS.—The London *Artizan* has the following in reference to this power as a temporary aid, always at hand, in the working of steam vessels: "One of the great inconveniences in screw vessels when sailing is the dragging of the propeller. There are other obstructions and difficulties encountered in navigating, which are only to be got rid of by a temporary application of force. Steam cannot be expected to be constantly maintained against every emergency, and, indeed, is not always available. The hydrostatic pressure is always at hand, and requires no lighting of fires or any other preparation. It is not only ever present, but economic. It has only to be applied when required, and the waste water discharged into the bilge can be pumped out at any convenient opportunity. When the screw shaft has been some time at rust it cannot be started unless a considerable speed has been got upon the ship, not, indeed, less than five or six knots; but once started, the screw would continue to revolve until the ship's speed had fallen to about three knots. Indeed, every practical sailor will be very well aware of the immense advantages of being able to start the end of the screw shaft into motion or to continue it in action, under occasional circumstances, for a short period. An apparatus proposed by Admiral Inglefield has been manufactured in Clerkenwell, and was tested a short time ago. It consists of a hydraulic cylinder, to be placed on the keel of the ship, with a piston and rod, very much after the manner of the ordinary steam cylinder. Into this the water will be admitted, through an ordinary Kingston valve. The diameter of the cylinder is 30 inches; the length of stroke 12 inches; and the machine is capable of making from 18 to 20 strokes a minute. To the piston-rod of this cylinder is attached a plunger pump, of the diameter of 3 inches, thus giving an accumulated force in the pump of say 100 times the pressure in the working cylinder, or equal to 1,000 pounds on the square inch. The water is conveyed, from a chamber surrounding the pump, by a pipe to a 4-inch hydraulic ram attached to the end of the lever of a ratchet brace, the ratchet-wheel of which is keyed fast to the stern shaft of the propeller. There is a valve hox attached to the ram cylinder, which is actuated by a pin in the ratchet lever, to which is connected a rod working the valve, thus causing a continuous action of the ram as long as the water pressure is permitted to act. * * The value of such a power, always ready as soon as the valve is opened, for any work, steering, turning turrets or screw shafts, raising guns, or, in ships provided with the proper wells, raising the screw bodily, is scarcely to be over-rated."

AMERICAN AND ENGLISH ENGINE BUILDING.—We clip the following from an article entitled "Iron Manufactures in Great Britain," by Prof. R. H. Thurston, U. S. N. A., in the *Journal of the Franklin Institute*:—"American engineers have been more successful than the British in securing small clearance, prompt closing of the cut-off valve, and in attaching the regulator to the expansion valve, while the latter exhibit a much better appreciation of the economical value of the steam jacket where high steam and great expansion are adopted. In both countries another requisite for economical practice—high piston speed—is gradually becoming fully recognized. One of the most interesting examples in this department of transatlantic engineering is found in the engines of Messrs. A. M. Perkins & Son, of London. This firm, which was founded by an American, is guaranteeing a consumption of less than two pounds of best coal per horse-power per hour with their mill engines, and claim, in some cases, to have brought the figure as low as one pound. These engines are of a peculiar form of 'compound engine,' the cylinders steam jacketed and vertical, the valve stems rotating, with their stuffing boxes placed at the ends of long shells surrounding the stems, the intention of the arrangement being to avoid burning the packing. Surface condensers are used and the feed returned to the boiler at the boiling temperature. The steam is cut off at an early point in the stroke by an independent cut-off valve. The boilers are composed of lap-welded tubes, 3 or 4 inches diameter and $\frac{3}{8}$ to $\frac{1}{2}$ inch thick, and are tested to 2,500 or 3,000 pounds per square inch. Where the condenser sup-

plies an insufficient amount of feed water, the residue is furnished by a still. Steam is carried at from 250 pounds per square inch upward, the safety-valve on Messrs. Perkins' own boiler being weighted to 600 pounds per square inch."

COMPRESSED AIR IN MINING.—The *Colliery Guardian* says that the pumping and the coal hauling in the Holmes Colliery, near Rotherham, England, are now done by means of compressed air. We quote in reference to the pumping arrangements:—"The air is compressed on the surface by a double-cylindred steam engine, with 18-inch cylinder and 3-foot stroke, with two air compressing pumps, 20 inches in diameter and 3-foot stroke, worked direct from the steam engine. Near this steam engine is placed a large air receiver, while corresponding with this in the mine, at a distance of nearly one mile, are three receivers connected by short cast-iron pipes, so as to form one, this plan being found necessary in order that the receivers could be made on the surface, and connected in the pit without riveting, as safety-lamps are exclusively used at the colliery. At this part of the mine also is an air engine with two cylinders, each 14 inches in diameter, with a 12-inch stroke, working two double-acting force pumps 5 inches in diameter, with a 12-inch stroke. The compressed air is conveyed from the compressing engine on the surface to the air engine in the mine in 7-inch cast-iron pipes. The discharge pipes of the pumping apparatus worked by this compressed air are 5 inches in diameter and nearly 1,000 yards long, having a vertical lift of nearly 100 yards. The apparatus was first worked on the 6th of January last, and the steam engine was worked at the rate of fifty strokes per minute, a uniform pressure of 25 lbs. per inch being maintained for eight hours at the surface and at the underground receiver. The air engine was worked during that time at the rate of fifty strokes per minute, 160 gallons of water per minute being raised."

NEW ROTARY ENGINE.—Wm. Vickery, of Maine, has patented an engine which is thus described in the *Chicago Railroad Gazette*:—"It has within a circular casing two solid wheels separated by a partition. The circular casing is enough larger than the wheels to form an annular chamber to receive pistons fitting the same. Upon the top of the casing are placed the valve seats, and through these are the ports through which enters the steam. Each wheel has its own inlet port and valve. Drop valves compel the steam to work only on one side of the pistons. The drop valves are raised when the pistons pass by means of inclined surfaces on one or both sides of the pistons, according as the engine is designed to move in one or both directions, but are pushed down again by springs. The drop valves are between the exhaust and inlet ports, so as to be raised after the steam has been exhausted and before it is again admitted. The valve stems are attached to rocking shafts, which are pivoted to suitable supports. The shafts are pivoted to a cam set on the shaft of the two solid wheels of the engine, and so operate as to open and close the valves as required to admit and let off the steam."

LARGE BLAST FURNACE ENGINE.—The *Iron Age* of April 6th says that the proprietors of the Fulton Foundry at Pittsburgh "have contracted to build for the Vulcan Iron Works, of St. Louis, the largest blast furnace engine ever erected west of the Alleghanies. This will be a vertical, direct acting, condensing engine, sixty inches bore and nine feet stroke, with blowing cylinder one hundred and eight inches in diameter and nine feet stroke, with two fly-wheels, twenty-seven feet diameter, weighing twenty-five tons each."

MACHINE FOR MAKING RAILROAD SPIKES.—Two Ohio men have patented a machine which turns out, according to the *Marietta Register*,—"75 well finished, smooth spikes, weighing 8 ounces each, per minute. Its capacity is fully 8 tons every ten hours, including all necessary stoppages. The spikes are superior in finish to any used on the railroads in this vicinity. A mill will probably be erected in Harmar, machines constructed, and the manufacture of spikes entered into on a large scale."

RAILWAY WATER TROUGHS.—Troughs for supplying locomotives with water, while in motion, have been laid on the Pennsylvania Central Railway, at Derry and near Johnstown. The troughs are 18 inches wide, 6 inches deep, and 1,500 feet long. The scoop will take up 2,200 gallons.

SCIENTIFIC PROGRESS.

THE WHITE BESSEMER FLAME DUE TO HYDRO-CARBON.—W. Mattieu Williams is giving, in *Nature*, a series of articles on the chemistry of the Bessemer process. No. 3 of the papers is especially upon the brilliant white flame of the second stage, which is totally different from the carbonic oxide flame produced by the combustion of carbon *per se*. He considers the whiteness due in a considerable degree to hydro-carbon. We quote:—"We have one set of workshop facts and laboratory experiments which go to show that for the production of steel, hydrogen in the form of hydro-carbon is necessary. It is well known that coal gas, paraffin, and other hydro-carbons, are more efficient cementing agents than pure carbon. Dr. Percy found that the charcoal of sugar, which retained some hydrogen or hydro-carbon, readily converted iron into steel, but that the same charcoal failed to produce steel under similar circumstances, after it had been deprived of its hydro-carbon. It is well known that wood charcoal which has been several times heated in the cementing furnace, loses some of its power of cementation, and this has been attributed to the driving off of the hydro-carbon contained in the fresh charcoal. Again, it is found that when, by means of an acid, we dissolve the iron of steel or white iron away from its carbon, the residue is not simple solid carbon, but an unmistakable liquid hydro-carbon, an oil which, like other hydro-carbons, burns with a smoky flame. In this case it is possible that the hydrogen may be supplied to the carbon by the water or the acid. If so it presents an interesting case of the formation of what we usually regard as organic matter from inorganic materials. If, on the other hand, the hydro-carbon exists ready formed in the steel and the white iron, the conversion of grey iron into white iron, i. e. of graphite into this hydro-carbon, is a still more remarkable case of the same kind. It is true that the hydrogen may be detected by a direct combustion analysis, but this does not reveal the mode of its existence. * * In the case of the Bessemer flame, we have a constant supply of air to a diminishing supply of carbon, and therefore we may expect that there should occur in the white portion of the flame due to hydro-carbon a change corresponding to that which would occur in Mr. Wilkinson's photometric flame, if, instead of a constant supply of coal gas mixed with an increasing supply of air, he maintained the air in constant flow and gradually closed the gas-cock. In this case there would not only occur a gradual diminution of the brilliancy but also of the dimensions of the flame. Such is the change which takes place in the Bessemer flame towards the end of the blow, and it so far confirms the hypothesis that a considerable portion of the white flame is due to hydro-carbon. If it were due to the combustion of iron the white flame should increase towards the end of the blow, for it is then that the iron, when no longer protected by the more combustible carbon, begins to burn in a serious degree, just as I have shown that the full combustion of the carbon takes place after the bulk of the silicon has been oxidised."

PERIODICITY OF SUN-SPOTS.—The following is the substance of a communication on the periodicity and heliographic distribution of sun-spots, addressed by M. Zöllner to the *Astronomische Nachrichten* for March 2d:—"The sun-spots are slaglike by the radiation of heat on the glowing and liquid surface of the sun; the products of the cooling having again dissolved, in consequence of the disturbance of equilibrium produced by themselves in the atmosphere. When these disturbances are not only local, but generally distributed, the formation of new spots is but little favored at the times of such general motion of the atmosphere, because then the most essential conditions of the surface are wanting for a severe depression of temperature by radiation, namely, the rest and clearness of the atmosphere. But when the surface has again gradually become quiet after the dissolution of the spots, the process again recommences, and acquires in this manner a periodic character, in consequence of the mean relationships of the surface of the sun, which may be considered as attaining an average in long periods. The distribution of the spots in area must, according to this theory, be determined by the zones of greatest atmospheric clearness, which, as has been shown, generally coincide with the zones of the greatest abundance of spots.—*Nature*."

VISION UNDER WATER.—Our issue for January 21st had an extract under the above head from a *Nature* correspondent, giving directions for preparing an air-lens by the aid of which perfect vision under water may be secured. The same correspondent sends another communication to the same journal for March 16th, making some corrections, which we copy:—"Further experience has shown me that the measurements I then gave were not so accurate as they might have been. Thus, the radius of curvature of the glasses in the air-lens to form a lens with a 2-in. focus in water is not $1\frac{1}{2}$ in. as first stated, but 1 in. only. Again, I somewhat underestimated the magnifying power of the anterior lens of our eye, formed by the aqueous humor, when I set it down as a lens with a focus of 2 inches; $1\frac{1}{2}$ inch is more correct. In accordance with this, I find that for the most perfect vision under water, we require a glass lens of $\frac{3}{4}$ -in. focus in air (in place of 1 in. as formerly stated), or an air-lens formed with two segments of a hollow glass globe $1\frac{1}{2}$ in. in diameter, placed concavities outwards. Both these lenses have in water a focus $1\frac{1}{2}$ in. long. These lenses are for fresh water. Sea water having a greater refractive power than fresh water, requires for perfect vision a somewhat more convex glass-lens and a somewhat less concave air-lens. I find that an air-lens made with segments of two glass globes of the diameter of 2 inches and $1\frac{1}{4}$ inches respectively, when immersed in sea water forms a lens of $1\frac{1}{2}$ -in. focus. But I should observe that good vision under water is obtained by lenses of various magnifying powers, ranging from $1\frac{1}{2}$ to 2 inches focus; but for the distinct vision of small text-type under water, the higher magnifying power is required, and it also is the best for distant vision under water."

FOSSIL CETACEA AT ANTWERP.—The Belgian Government has carefully preserved all fossils met with during the extension of the Antwerp fortifications which has been going on for several years. *Nature* says:—"Parts of the Black and Grey Craggs proved to be a complete channel house—so abundant were the remains—and these have been quietly brought together and placed under lock and key for the last eight years. The richness of the fauna disintegrated may be judged from the fact that it is stated that eight new genera of Ziphoid Cetaceans are indicated besides sixteen new species belonging to known genera. Many of the forms are represented by far more complete portions of the skull than have hitherto been known from these beds, also portions of the trunk, limbs, and lower jaw in connection with these. Portions of the skull of the fossil Walrus, tusks of which occur in the Suffolk bone-bed and have been described as *Trichecodon*, have been obtained, as well as remains of seals. All these specimens are under study by the Vicomte du Bus, and are not open to the inspection of even professional palaeontologists. They are being carefully and freely engraved, and will soon, it may be hoped, be made known to the world."

THICKNESS OF THE SEDIMENTARY ROCKS. The *Geological Magazine* for March has an article by Mr. James Coll on the "Determination of the mean thickness of the sedimentary rocks of the globe." He remarks that it must be borne in mind that, from the continual action of denudation, the existing sedimentary rocks only represent a fraction of the whole thickness of sediments that have been deposited. Taking the denudation of the area of the Mississippi as a guide, he estimates the wearing down of the land at one foot in 6,000 years, and the matter thus removed spread over the bottom of the ocean would produce a deposit one foot thick in 14,400 years. Taking the maximum thickness of British sedimentary strata as calculated by Prof. Ramsay, namely, 72,000 feet, to represent the mean thickness of all the sedimentary rocks which ever have been formed, the author thus gets 1,036,800,000 years as the age of the stratified rocks.

The highest point ever attained by any halloon traveler, namely, seven miles, was made by Mr. James Glaisher, the English aeronaut, in an ascent made from Wolverhampton, on the 2d of September, 1862. At this height Mr. Glaisher became insensible, and Mr. Coxwell, his companion, nearly so.

CORRESPONDENCE.

Flint Creek, Montana.

[Written for the Press.]

EDS. PRESS:—In a former letter I intended to convey to your readers an idea of our location and means of access. I also stated that a small mill with imperfect machinery was then in operation under the management of Capt. Geo. Plaisted, formerly of Nevada, and that, as soon as practicable, I would forward results of the ore worked. It will be understood that this mill is only adapted (and poorly at that) to the wet process. Upon application at the office of the mill Mr. R. kindly gave me from the books the following: Whole number of tons worked, 432; Bullion acct. credited by First National Bank, \$23,483. Thus it will be seen that the ore worked averaged over \$54 per ton. This was on "second-class ores," recently two-thirds of which had heretofore been classed as "refuse," and but 80 tons of which were taken from the vein.

It has now been pretty thoroughly demonstrated that the higher grades of ore in this camp demand a different treatment. In view of this fact, Mr. R. is contemplating a new milling enterprise with machinery adapted to the wet and dry process, and in furtherance of this object, will soon pay San Francisco a short visit. Our higher grade ores are the most base and intractable. There are now some four or five mines opened in this district, all ore of this character. Beside these, there are three mines opened of comparatively free ore, the richest of which, however, cannot be saved by the wet process of working. The ore of the "Hope," "Comanche," and "Comanche Extension" is all of this character.

Brown Bros. & Co. have recently struck, in a small tunnel to the vein of "Comanche Extension," a very rich body of black, mottled coffee-colored ore, about five feet thick on their west wall, which is widening as they go in. They are now twelve feet from the west wall, and think the east, not within three or four feet yet. The ledge is very solid, has a heavy coating of a clay-like substance between the formation and quartz, some twelve inches thick, while the formation wall is smooth as if worked to a line. This I am told is an indication of permanency. The owners informed me they were willing to enter into a contract to deliver one thousand tons of this ore before the first of August, and two thousand additional by the first day of January next. Other parties are anxious to get rock worked and probably will make the same offer to any responsible party presenting themselves.

The fall of snow in the mountains during the present month exceeds that of any previous March since the country was known. It packs very close and hard, the temperature being mild, and bids fair to furnish an abundance of water for the ever thirsty miner. We feel warranted in predicting the largest product of bullion, in this Territory during the coming season that has ever been taken from the ground. With plenty of water, the placers well opened, and no sensational digging yet struck, we see no obstacle to such a result. The agricultural lands are rapidly settling up, and at least one-third more seed will be planted and sown this spring than in any previous season.

Philippsburg, M. T., March 22, 1871.

The Eclipse M. Co., Inyo County, Cal.

[Written for the Press.]

EDS. PRESS:—On the morning of the 3d inst. in company with one of the editors of the *Inyo Independent*, I took a trip to the Eclipse Mining Co.'s works, to be present at the starting of steam through their new engine. The works, as contemplated by this company, when completed, will be the largest mining enterprise this side of Virginia.

The Mill

Is not yet ready for crushing ore, but under the able management of Capt. Henry Tregellas, (a mining engineer of experience in England, Australia, and California,) is assuming shape rapidly. The machinery consists of a 60-horse power engine, a queer looking 6-stamp battery, an alligator rock-breaker, and eight Wheeler amalgamating

pans, with a new style of shaking table. In fact the whole machinery is of a different pattern, from anything I have ever seen used in gold mining, or gold extraction rather. This machinery is from the works of Harvey & Co., Haylo, Cornwall. But from what I could glean from Capt. Tregellas, he prefers the old style of California stamp batteries. He is now cutting a ditch of nearly five miles in length, to take water from the Owen's River to supply and run a water mill of 42 stamps, which, if successful, will be increased to 100 stamps. The present steam mill will be put in operation and kept running to assist in paying the expenses of building the water mill and other improvements, to be mentioned further on in this paper.

This company is an English Mining Co., with their head quarters in London, England. They possess mines in several portions of Brazil, Australia and England, and have set apart \$500,000 of their capital to carry out this speculation in Owen's River Valley. Their mill is situated on the bank of the Owen's River, about twelve miles south of Independence.

The Mine

Is in the foot-hills of the Inyo range, and about four miles from the present mill, but will be at least a half-mile nearer the new water mill, from which a tramway 3½ miles in length will be laid on such a grade that the cars will run from the dump to the mill by gravitation, and be transported back by mule or locomotive power. The main (or Haman shaft, as it is called by the miners,) is 300 feet deep, and is run upon the ledge, which has an incline of about 35°, with double tramway worked by a whim at top.

At the depth of 100 feet, there is an adit level with turn table about 150 feet in length. At the further distance of 60 feet there is another adit of nearly 100 feet, where a "dyke," as technically termed by the miners, has formed and cut the ledge. Upon this "dyke" the miners had run 60 feet in hopes of re-finding the ledge, and, while I was there, found in the breast vein matter of good appearance.

At the depth of 220 feet there is still another adit, 200 feet in length, at the end of which the miners were making a rise to intersect the north shaft (an old working), and were within a few feet of intersection. This rise is for the purpose of getting air at the foot of the main shaft, 300 feet below; the air was pure, although rather warm. At 185 feet deep a cross-cut was made upon another "dyke," at the distance of 35 feet from which a large amount of rich galena and silver-bearing rock was extracted.

Transportation.

The rock arriving at the top of the mine is run off on a tramway about 100 feet and dumped down a small cañon, and falls 500 feet perpendicularly; it is taken into a car again, run along 200 feet or less, and again dumped, falling say 50 feet more; again it is loaded into cars, and now sent down a double-track incline tramway, 650 feet in length, worked by a friction brake at the head, the loaded car drawing up the empty one by means of a wire-rope. Upon arriving at the bottom, by a simple device the loaded car discharges its cargo into a chute, from which it is taken into wagons and hauled to the mill.

To dispense with handling and re-handling the ore in this manner, Capt. T. is projecting a tramway alongside of the mountain, a distance of 1,500 feet, from which point it can be dumped directly to the train of cars designed to run to the mill.

Furnace—Price—Working Force.

The company have also started to erect a smelting furnace similar to those in use in other parts of the country, for the purpose of smelting the galena and silver-bearing products.

This company purchased the mine about one year ago from the Union Mill and Mining Company (whose mill was burned by the Indians in 1864), for the sum of \$150,000. They are now refitting the engine of the old mill, to be placed at the mouth of the mine for hoisting, and for power for the blast furnace. There are now engaged in the mine 16 men, at the mill 24, making in all 40 men employed. The reason of the smallness of the force is that they have at least 1,000 tons of milling rock upon the dumps, and at least 100 tons of smelting ore lying in and around the mine. The Manager prefers to sink and run levels, thereby developing the mine, rather than to stoop; as he rightly says, "when we want it we know where it is." I could give your readers much other detail, but I am afraid I have drawn already a little too long a letter for your columns.

Crowquill.

Independence, Inyo Co., Cal.

Transcontinental Traffic.

BY J. RICHARDS, M. E.

[Written for the Press.]

The interchange of the products of nature and industry from one part of the world to another, has in all ages monopolized a large share of the best talent in civilized countries. In fact, the amount of commerce of any people is a reliable exponent of their civilization. The lines of commerce and trade are, no doubt, to some extent, established by circumstances, or by laws that were not considered nor understood; and it is only in late years, and since steam transit has been known, that commerce has become a science, in the sense of being governed by laws that can in advance be ascertained, and from reliable deductions made as to its future stability and extent.

History shows the influence of international trade—shows how the trade of the East has in successive ages built the great commercial centres of the world. Civilization trading with barbarism, gave the products of educated skill for gold without a regard for the law of equivalent values that now regulates trade. Such commerce built Rouen, Constantinople, Paris, and London. But at the present day, with the widespread geographical knowledge that exists, with our means of trade and communication, no chance exists for speculative commerce. The merit of a balance between supply and demand cannot long exist without being met by such trade as produces an equivalent. If the fur skins of Hudson Bay are wanting in China, they will soon find their way there.

Now no want can long exist without finding something to satisfy it. Like mechanics, our manufactures and commerce have bowed to science and knowledge; and the most daring ventures of capital and life are continually being made based upon deductions that seldom fail. A dye is wanted; it has a vegetable base. Science points out the latitude and climatic conditions that favor its growth. An expedition proves its existence at the point indicated; and we find a colony sent out from New York to settle the country, and collect it in Lower California. A short line of communication from the eastern to the western world is discovered across our continent. There is a want of means of transit for travel and valuable merchandise. Millions of dollars are expended in building a railroad across the country. This road is carefully watched; its cost, earnings, and its inducements are weighed; and as soon as careful reasoning shows a paying necessity for another, it will be built.

The reasonings on which great commercial enterprises are based, are rarely, in all their details, given to the world. A degree of secrecy is maintained, enough only being divulged to inspire the confidence needed to command the capital necessary to carry them out. It is true that the advantages to accrue to the public and stockholders in such ventures, are heralded and painted in glowing colors throughout the land, supported by spurious reasoning and such sophistry as appeal to the understanding of those who are incapable of following out the deeper conclusions of the originators of the scheme. But below and beyond this, is laid a substratum of deductions founded on the laws of trade and intercourse, that would be both difficult to explain and to understand in a popular way.

One of the great advantages of a transcontinental railway set forth and yet maintained, is that of an exchange of products between the Pacific and Atlantic States, a kind of home trade that will enrich our country out of exchange of its own products. Such a mission for our great railway is not supported by the laws that govern trade, nor by the conditions that exist at either end of its route. That there will be a large commerce for a time in valuable products of light weight, is possible; but such a commerce is contingent upon a train of present circumstances and conditions that will soon pass away, depending entirely upon an equilibrium between the cost and elements of production in the two sections. "Carrying coals to Newcastle" is an adage illustrating the absurdity of unnatural commerce, that has for a century been quoted to illustrate this fact; and the idea of carrying by rail, or even by water, the manufactured products from our Atlantic States to the Pacific coast, will soon be very much like "carrying coals to Newcastle," and our generation may yet see a clamor for tariff on Pacific products.

To return to the former proposition about the laws of commerce, it is safe to assume that there has never been much gain in trading between countries when there is a balance of civilization. It involves a nice distinction and constant rule as to values, that precludes speculation and balances the exchange of money. To trade with less civilized people we sell goods for gold. If we trade with those more civilized we exchange gold for what their superior intelligence has produced. This proposition, of course, applies more particularly to manufactured products,—about the only imports that come into our country which has been endowed by nature with nearly everything wanted; and it is only a want of balance in skill and cheap labor that creates a demand for imports.

Granting these premises, it is easy to see that commerce between the Atlantic and Pacific States can never exist to any great degree, nor be a source of gain to either section of country. The business of railways will be to carry passengers and mail,—quite enough, no doubt, to furnish business for many lines in the future. But merchandise must obey the imperative laws of trade that are not changed by the schemes of men and corporations.

The elements of manufacturing are: material, food, and skill. The material must be local, furnished by nature when naked. A high degree of skill, concentrated at one point and surrounded by favorable conditions for some peculiar branch of manufacturing, may for a time draw material from distant sources, but with reference to iron, coal, and wood, the proposition can be maintained. Food, which more than anything else governs the cost of labor, must also be local; it must be produced where it is consumed. Skill is the portable element in manufacturing. Man does but little now but direct natural forces in the manipulations of the work shop, and the small degree of skill needed with our modern facilities for education, dispels all idea of monopolies based upon special skill. One man may, with labor of ordinary intelligence at his command, found and conduct a large business with which he is conversant. Skill in manufactures is like "leaven in the loaf,"—it soon pervades a community.

There was a time—in fact we are just emerging from the period in which we ignored the idea of fixed laws to govern mechanical manipulations. The Sheffield steel makers furnish steel to the world, because the laws of metallurgy were not understood, and its manufacture was a discovery—a secret. A greater knowledge of metallurgy has developed in this country, within the short period of fifteen years, a steel manufacturing interest that has almost stopped importation and supplied the wants of a population of thirty millions of people. Skill is a concentrated element in manufactures,—the only essential that can be transplanted and flourish in any country that furnishes enough natural intelligence to sustain it.

In speculating as to the future of the Pacific coast and its relations with the Atlantic States, we have but to call to our aid the recognized laws of trade, and form an equation in which the two sides will represent the relative resources of the two sections:

1st. The natural resources of the countries, consisting of fuel, food, iron, coal, wood, etc., with climatic conditions.

2d. First cost of natural products and raw materials.

3d. Population, its character and probable "hew," with the kind of public that will control it in matters of popular interest.

4th. The relations to a market and to an export trade in the future as well as to local wants.

With correct statistics on these points, and a careful consideration of the physical geography of the Pacific coast, it will not be difficult to arrive at a conclusion as to the extent of transcontinental trade, in manufactured products at least.

[To be continued.]

Banner District, San Diego County.

[Written for the Press.]

EDS. PRESS:—I send you a few items of news from this district, thinking they may be of some interest to the readers of the Press.

McMechan's mill has been running on Redman rock, which has paid about \$60 per ton. Last week same mill crushed 25 tons of Lady's Leg rock, or, as it is now called, Kentuck, averaging \$57 per ton. Six miles south from here is King's new discovery. They are pounding out four ounces per day with a hand mortar. In this discovery there are three ledges running parallel, all included within ten feet. McKean's mill has been running on Warlock rock, results not known. Madden, too, had 25 tons of rock crushed at McMechan's mill, which cleaned up \$1,500.

Bill Moran had six tons crushed from the Corral mine, giving \$300 gross. The Antelope Co. has a five-stamp mill on the way, which will arrive in a few days. It is rumored that the Chapparral mine has been sold to capitalists from San Francisco, for \$15,000. The weather is beautiful, and the prospects good for mining throughout the district.

BANNER MINES.

Banner City, April 2, 1871.

FISH IN DEEP WATER.—A curious experiment was performed in France, recently, to ascertain whether fish could live in great depths of water. The fish were placed in vessels of water made to sustain 400 atmospheres, under which they lived and preserved their health. It is, therefore, concluded that fishes may penetrate to very great depths in the ocean with impunity, as a pressure of 400 atmospheres corresponds to a depth of 13,600 feet, or about two miles and a half.

THERE are now about 250 postmistresses in the country, and the number rapidly increasing.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

LARGE BODY OF ORE.—*Miner*, April 8th: The Monitor Tunnel No. 3 has just passed through probably the largest body of good ore ever opened on this coast. The vein is a high grade for twenty feet in width and judging from the croppings several hundred feet long, extending across the M. & N. and Silver Glance properties. Much of this will assay three to five hundred dollars per ton.

MONITOR MILL.—Lumber is being delivered on the ground, and the carpenters will commence work on Monday. Three arrived from Illinois on Wednesday.

GLOBE.—Another vein was cut in the tunnel early this week, containing according to different assays, 15 to 50 dollars in gold and silver to the ton.

SHIPMENT OF SULPHURETS.—*Chronicle*, 8: About three tons of the concentrated ore of the Schenectady Co., were this week shipped to San Francisco. The mine continues to look well, and much fine ore is coming out.

AMADOR COUNTY.

KENNEDY.—*Dispatch*, April 15th: We understand that the company have abandoned the idea of digging a new ditch, as they have perfected arrangements for supplying their mill with water immediately by the purchase of an old ditch belonging to Mr. Morgan, of the Oneida. The mill will commence crushing rock Monday or Tuesday.

CALAVERAS COUNTY.

ITEMS.—*Chronicle*, 15th: C. W. Smith of Grass Valley is keeping an eye on his quartz interests in Lower Rich Gulch, and hopes to commence work again soon... The big reservoir on Negro hill is undergoing its cleansing. The sediment that has accumulated during the year is being hydrauliced out. It will take two weeks longer.

SAN ANDREAS.—A letter from the Supt., of date March 12th, says of the Union Mine: "A new horse-power has just been finished with hoisting gear. A Beaux & Guidon pan has been added. The shaft, 165 feet deep, has been supplied with new timbers and lagging. The drift at depth of 105 feet is in 12 feet. The vein fills the whole width of the drift, 7 feet, and is all pay quartz, yielding \$20 per ton. There is 300 tons quartz on dump."

EL DORADO COUNTY.

THE HARMON.—*Placerville Democrat*, April 15th: Mr. Ellsworth took charge three weeks since. He has cleared the mine of water, overhauled the mill, partly re-timbered and fixed the old shaft so as to work the pump in it, and has a new working shaft, to the north of the old works, now down to the depth of fifty feet on the ledge, and has had the mill running for the past week.

INYO COUNTY.

CERRO GORDO.—*Cor. of Independent* April 8th: V. Beaudry's furnace since October last, has turned out 7,222 bars of bullion weighing 301 tons, of an average value of \$250 per ton, in the aggregate \$75,250. Running time of the furnace 72 days, or an average of 100 bars per day. The lead in the bullion considerably more than pays the freight to San Francisco. M. W. Belshaw's furnace has produced about the same quantity per day during the same period as Mr. Beaudry's hut has been in more constant operation.

ECLIPSE MILL.—The engine was started on April 3d for the first time. It is of English build, 60-horse power, 6 stamps. The mine has a 310-foot shaft on the lode all the way. The amount of ore in sight is prodigious. Average width of ledge seven feet. The Union Co. extracted from the 160-foot level 500 tons of ore, which worked at their mill \$26 per ton, the tailings assaying \$100 per ton, all gold. A lot of 50 tons netted \$33.50 per ton—the whole unassorted. Fine gold can be seen in most of the rock, while the other class of ore—the silver—will average \$250 assay per ton. Certain ones have made out that this ore was worth over \$2,000 per ton "average," the very finest specimens being picked to obtain said "average." The cost of reduction even by the present cumbersome and costly arrangements can not exceed \$14 per ton. A smelting furnace is to be built. A railroad, 24-inch gauge, 3½ miles long, will take the ore from the shaft to the mill of 100 stamps which is to be erected.

KEARSARGE.—*Gold Hill News*, April 12th:

John Rooney, foreman, arrived in Gold Hill this morning direct from the mine. Mr. R. informs us that Thompson, the architect, of Virginia City, had a force of men at work putting up the tramway of three thousand feet on the mine, and that everything was going on vigorously in overhauling the mill, mine, etc.

KERN COUNTY.

HAVILAH.—*Cor. of Visalia Delta*, April 13th: Our mining interests are looking well just now. Mr. Burke, Supt. of the "Joe Walker," writes from the city, that the new pipes will be shipped on the 5th; and we are in expectation of hearing the stamps on the 1st of May crushing better rock than ever. This mine has paid in the past, for a hundred successive days, \$1,000 per day. The McKeadney mill is running regularly on ore which will pay \$50 per ton. The Howe is running on custom rock. The St John & Co., at Sageland, is running day and night and paying handsomely. L'Esperanza, in Kelso Valley, is about to start up again. They have several hundred tons of quartz out. Sol. Carter has sold out his interest to W. Sungate and C. Cusick for \$2,000, we are informed.

NEVADA COUNTY.

SPLENDID.—*Grass Valley Union*, April 13th: Yesterday the Town Talk gravel mine showed very rich in gold. Mr. Walker tried a pan of dirt from the breast of gravel and got \$17.50. The Town Talk is nearly east from Grass Valley, and is supposed to be on the Alta Hill old river bed.

MINING BREVITIES.—Same of 16th: On New York Hill, and from Rocky Bar ledge a company are taking out rock paying \$40 per ton. The Rocky Bar is one of the old time rich ledges, and now gives promise of doing better than ever... Webster Co. paid off all its hands yesterday, and the money came from the mine... The Baltic Gravel Co. finished yesterday after a two weeks' run, and cleaning up only seven boxes of the sluice, the result was \$1,100. The number of men employed is seven. The Baltic claims are east of the Webster, and on the same lead. The Co. have still a reserve in the lower boxes of their flume.

EUREKA MINE.—Same of 18th: The Eureka had a clean up Saturday. For the twelve days including, the yield is \$30,800. Some of this comes from sulphurets, but not more than \$800.

WASHINGTON TOWNSHIP.—*Transcript*, 14th: Road Commissioner Cleveland, recently returned from a trip, informs us that the miners are all at work.

BLUE TENT.—Five companies are at work with full heads of water. They have fine prospects so long as the water will hold out.

LITTLE YORK.—*Gazette*, 11th: We learn that the mining prospects are cheering. There is plenty of water; everybody is hard at work, and all are sanguine.

GRANITEVILLE.—*Cor. of same*, 14th: The Erie Mine, leased by Veach and McCurdy for two years, is paying large dividends, and it is estimated that they will clear \$100,000 on the operation before the lease expires. The owners, Bull & Co. of San Francisco, had a late offer of \$112,000 for the mine but would not accept it. The Ansho, a mile from the Erie, is a large, well defined ledge, and shows plenty of free gold. I understand that there is a San Francisco company negotiating for its purchase. The Washington, on the line of the Erie, and between it and the Ansho, is six feet wide, and shows free gold. The owners are workmen without means, and I think it can be bought very cheap. It is owned by Becker, Johnson & Co. The above ledges are all in slate and are on Irwin's ridge. The Black & Irwin mine has been worked all winter, and is paying large dividends. They employ 25 men. The Birchville has not been worked, the owners being unable to get their machinery moved before the snow set in. This mine is at South Fork. The Jim mine Co. had also to suspend work during the winter. There are several ledges in the vicinity of South Fork which will be worked in the coming season. I am informed that Wm. Watt of the Eureka mine, intends to erect machinery on the Sweet ledge. Gravel claims are being fitted up in all directions, and the claims worked are paying well.

PLACER COUNTY.

SHIPLEY MINE.—*Herald*, April 15: We are told that the Shipley has changed ownership, and is now mainly owned by the same men that own the St Patrick. There was 1,700 feet on the Shipley and Trouble ledges belonged to McFadden and Sears, with the new 10-stamp mill. To this the purchasers have added 1,000 feet of the main Shipley ledge bought from Baptist Stinger, and 1,000 feet on the same bought of Thatcher Ross which would make 3,700 feet in all. About the center of this 3,700

feet Stinger had sunk 70 feet, and there found the ledge five to seven feet thick, and it had paid from the top down, at various millcrushings from \$22 to \$30 per ton.

SPECIMEN.—The finest gold quartz specimen we ever saw was shown us yesterday by Wm. G. Greene. It is a slab of solid quartz one foot long, averaging three inches wide, and two inches thick, weighing 8 pounds. We should say that fully one-fourth of the weight was pure bright gold. It was taken from Mr. Greene's mine two miles from here, at a depth of 65 feet, and from a point in a drift 42 feet from the main shaft.

PLUMAS COUNTY.

MORE WATER AND MORE DUST.—*Quincy National*, April 8th: The late rains increased the water and the happiness of the miners in like proportion. They are all hard at work and in high spirits.

GOOD RESULTS.—Ray & Conklin of Argentine, recently made a clean-up after running a large quantity of rock through their mill. The result was satisfactory, and work in that section is prosecuted with renewed energy.

FLOURISHING.—The Greenville Co., (Bidwell & Co.) have purchased the Pennsylvania mill which with the Lone Star of 10 stamps, will make twenty-two stamps. The mine is now opened 220 feet deep, a strong, well defined lode ten to fourteen feet wide.

GREENVILLE.—*Cor. of same*: Messrs. Lawrence & Emmons are re-opening the Bullion mine, with every prospect of making it "pan out" profitably.

SAN BERNARDINO COUNTY.

A Los Angeles telegram of April 12th says: A very rich discovery of silver ore has been made in the Ord district, sixty miles southeast of San Bernardino, and assays of surface rock sent to San Francisco go as high as \$377 per ton. A large party will immediately put out to open the mine thoroughly and send several tons of rock to be worked. The lead is eight feet wide and extends two miles.

SAN DIEGO COUNTY.

CUYAMACA GRANT.—*Union*, April 13th: A letter from Julian City informs us that a meeting of the miners and settlers was held on the 2d, to consider the progress of the pending case concerning the survey. A committee was appointed, and the meeting adjourned to the 9th.

BULLION.—Pauly & Sons forwarded \$1,000 gold bullion, from the Julian mines, by the Wm. Huber.

ANOTHER MILL.—Same of 5th: A fine quartz mill arrived on Thursday, for the Antelope Co. It will be erected at the claim on San Felipe Creek, three miles from Julian. The Antelope commenced working ore in an arastra last November, and since the first of January have cleared enough to pay for the mill and set it in motion. The week previous to ordering the mill they crushed one ton which yielded \$770.

SIERRA COUNTY.

ITEMS.—*Messenger*, April 15th:—The Shamrock mine, at Fir Cap, is being worked with great vigor... It is reported that Jas. Galloway recently found a nugget worth \$300 in the point below the town... More snow has fallen than for 18 years. So say the miners... Mr. Silverman is still Supt. of the Primrose and two other mines belonging to the Co. He will commence crushing about May 1st.

NORTH SAN JUAN.—*Cor. of same*: Every ravine that has pay dirt is being prospected and in many places with flattering results. A short time ago a high flume was blown down that supplied the Bed Rock and Kenebeck Gravel Mining Companies with water, and three weeks' work was necessary before it was repaired.

RICH STRIKE.—*Democrat*, 13th: Some parties working in Jim Crow Cañon brought into town, Saturday night, \$369 worth of gold dust, the result of one week's work. One piece among the lot weighed 12½ ounces.

SHASTA COUNTY.

NUGGET.—*Courier*, 15th: Last week Robert Pitt, of Portuguese Flat, found a gold nugget in his claim which weighed \$70. Pitt says it is nothing unusual to find pieces worth from \$10 to \$30.

TRINITY COUNTY.

DOUGLAS CITY.—*Journal*, April 15th: The ditch to Whetstone har was seriously damaged by the flood. The upper part was washed bodily away. Lange, Dixon & Co. are at work in their Dutton's creek claim. The ground is very hard, so that although they have 200 feet pressure on the hydraulic it cuts their bank hut slowly. We learn that they propose to run tunnels and blast to some extent. The river rose so rapidly during the flood that Chas. Tourout lost eight boxes of the flume on his claim at Fillibuster flat, with the

blocks, quicksilver, amalgam and undercurrent. Crickard & Theodor are doing well in their Union Hill claim. Not having fall sufficient to use a hydraulic to good advantage, they work this season by "gouges." The gold is fine and yields from \$6 to \$8 a day to the hand, six men working.

INDIAN CREEK.—We learn that the miners are all at work with plenty of water, and prospects in that neighborhood are flattering. Silcox is still crushing rock from his ledge, and expects to make a clean-up next week.

LOWER TRINITY.—W. S. Norman, on Big flat, is said to be doing well. On Ssw-mill flat, Thos. Price continues to take out dust in large quantities. At Cox's bar, everybody is at work, they have plenty of water and are doing well. Thos. Cox & Co., in the old Smith claim, have splendid prospects. Wm. McCollum & Co., on the upper end, are reported as having struck good pay. In the neighborhood of Taylor's flat, Ben. Wattles & Barnum, R. B. Martin and Alex. Pelletreau are cited as having extra good claims, while all the other miners are doing well.

TUOLUMNE COUNTY.

CONDIT CLAIM.—*Sonora Democrat*, April 15th: Work is constantly carried on in the claim with fair success. The fine brick store occupied so many years by Condit has been taken down with the store room next south of it, and now the brick building next north is being taken down for the purpose of mining the ground under it.

Nevada.

COPE DISTRICT.

ITEMS.—*Owyhee Avalanche*, April 8th: The Argenta Co. have finished sinking, and are drifting for the ledge... The Robert Emmet mine continues to improve, and work is prosecuted with vigor... Many Bull Run miners, who have been wintering elsewhere, are preparing to return.

ELY DISTRICT.

BULLION SHIPPED.—*Record*, April 9th: Wells, Fargo & Co. shipped from their office in Pioche, on the 6th and 8th instants, bullion valued at \$19,345.50.

THE SITUATION.—Same of 13th: Thousands of tons of rich ore are on the dumps; and, although large quantities are shipped for crushing to Hamilton and Silver Park, and fifty-five stamps are running day and night in Meadow Valley—12 miles distant—still the cry comes up:—"Give us more mills!"

ORE FOR THE PARK.—The ore extracted from the Alexander by Charley Noakes & Co., is being shipped to Ferguson's mill at Silver Park. A former crushing of this ore gave satisfaction to all interested. This is very good for the investment of six weeks labor—say \$50 a day or more.

EUREKA DISTRICT.

HOME TICKET MINE.—*Sentinel*, April 15: It is expected that the new furnace will be turning out bullion within 40 days exclusively from Home Ticket ore. The mine has never looked so well as now. The ore can be very readily extracted, and cheaply mined. The average of seven assays gave \$111.54 per ton.

EUREKA CONSOLIDATED.—The furnaces made in March, 246 tons of base bullion. The two new furnaces will be running a few days and will smelt 40 tons per day, and the old ones 30 to 35 tons.

PHOENIX COMPANY.—A new strike in the Lexington, and the mine looks better than at any previous time. In the Empire, work is going on steadily. The Adams & Farren is carrying the same body of ore, hut galena has taken the place of carbonates in the bottom of the shaft.

HUMBOLDT.

BUTTE MILL, RYE PATCH.—*Silver State*, April 15th: We learn that ten days since the Mill after a cessation of operations for a month, resumed, with an increase of five stamps—making ten. The furnace, of Akin's patent, was overhauled and improvements made. The works are said to fully reach anticipations.

SHAKESPEARE MINE.—Mr. Hanna finds in his new shaft at the depth of eight feet, two veins of quartz showing abundantly in sulphurets.

RAILROAD DISTRICT.—*Elko Independent*, April 15th: Dr. Kinkead has hounded the Lone and True mines to a company of New York capitalists, on four months' time for \$40,000, who will proceed at once to develop them.

GALENA.—*Cor. of Register*, April 15th: Avalanche mine is idle for want of machinery. Shiloh is in the same fix. The Butte Co. are putting up a mill which will be running by June 1st. The Copper Co. have 30 men at work and are taking out much ore. Cosmopolitan will start in again. Black Hawk is giving out fine ore.

STRIKE.—We learn that R. McBeth has struck an extraordinary vein of ore in the Buena Vista mine. It is said to be equal in richness to anything yet found in Galena district.

WASHOE.
YELLOW JACKET.—*Enterprise*, April 16: This Co. have extracted an average of 180 tons per day during the past month, the average yield of which has been \$35 per ton, amounting to \$6,300 per day. This ore is principally from between the 800 and 1,000-foot levels. The mine is looking well throughout.

BELCHER.—The Co. are taking out no ore at present, being engaged in cleaning out and repairing their main drift on the 830-foot level.

OPHIR.—Since our last, great progress has been made in the works for the development of this mine. The up-rise from the south drift has reached the height of 300 feet, where a cross-cut is being made to the west through porphyry. There are indications that ore will be found in the north mine.

SUCCESS.—This Co. are taking out 35 tons per day, sufficient to keep their mill running. The mine is looking well. A connection is being made between their main tunnel and the surface to secure ventilation to enable them to work the White lead.

CHOWN POINT.—During the week 1,150 tons of ore have been sent to the mills. The average yield of the ore milled was \$50 per ton, which would give a monthly yield of \$230,000. The mine is looking well throughout.

SAVAGE.—About 125 tons of ore of fair quality are daily extracted. Three cross-cuts are being run on the tenth level, which have not yet reached the pay ore.

HALE AND NORCROSS.—The extraction of ore continues in the usual quantities. The quality is unchanged.

CONSOLIDATED VIRGINIA.—The drift northward from the main west drift is in 250 feet, leaving 250 feet yet to go to reach the north line.

OVERMAN.—Taking out 40 tons per day from the 226-foot level. This ore goes out through a tunnel. They are only running the pump at their hoisting works to keep down the water. No prospecting is being done. The receipts for March amounted to \$20,100.

CHOLLAR-POTOSI.—During the week this Co. have extracted 1,800 tons of ore and forwarded to mills 1,940 tons, the average yield of which has been \$74.22 per ton. The amount of bullion forwarded was \$55,514. The mine is looking well throughout.

IMPERIAL EMPIRE.—The Co. is still drifting and cross-cutting on the 1,300-foot level. Sinking upon the main shaft will shortly be resumed.

CALEDONIA.—The usual ore is being extracted. The ore-breasts are looking well throughout.

SIERRA NEVADA.—The mine and mill and the old Sacramento and Meredith mine and mill are shut down under an injunction obtained by the Kenosha Co.

SUTRO TUNNEL.—The tunnel is now in 1,915 feet. The ground is of such a character as to require timbering. There is no water coming in at the face.

SEOREGATED BELCHER.—Work has been delayed by the breaking of cables. All is in order again, and considerable prospecting is being done.

GOULD AND CURRY.—This mine is not yielding much ore, and none at all except from the old upper workings. New foundations for the hoisting reels have been completed, and the shaft is to be re-timbered 400 feet, for further prospecting at the lower levels.

SILVER.—During March, 1870, Wells, Fargo & Co. shipped 36,780 pounds of bullion. In March, 1871, they shipped 38,818 pounds.

The Gold Hill *News* of April 11th says that Dall's mill, Washoe Valley, last week cleaned up \$14,000 from a run of 17 days on tailings and slimes.

WHITE PINE.

REVIEW.—*News*, April 15th: Work upon the tramway has been delayed by the storms. The grading for the site for the engine to raise ore from the English Co.'s mines is about completed, and the engine will soon arrive. With the advent of the next month, everything in connection with this enterprise will be in complete working order, and the ores will be conveyed to their mill (about two miles) at a cost of about fifty cents per ton.

Several new discoveries have been made during the week below the Eberhardt, on the line of the tramway.

The Silver Wave is milling the usual amount of ore, the last lot of which pulped \$13 per ton. Two hundred and fifty tons

of Virginia ore, worked during the last quarter, averaged \$60 per ton.

The recent discovery of a mine of free ore on White Pine Mountain, was unexpected; a strong impetus will be given to prospecting in that direction. Taken altogether, the prospects of our district are materially brightening.

The hullion shipment for the week was 13 bars, valued at \$16,810.37.

ITEMS.—New shaft in disputed ground near the Eberhardt is down 65 feet. The force in the other mines of the company is rather keeping watch than working, while the weather is unfavorable to the completion of the tramway.... South Aurora keeps 90 men at work.... The ore in Ward Beecher Consolidated improves. It is no doubt the regular Ward Beecher ore.... Original Hidden Treasure shows high grade ore all through the shaft from the lower level.... Silver Ware ore pulped \$113 at Big Smoky mill.... In the Virginia every man takes out one ton of rich ore per day.... Superintendent of the General Lee has returned from below, and will begin work Monday with a full force.... Narrow Gauge, on White Pine Mountain, in the midst of hase metal, is the first discovery of free ore on the mountain. Assays range from \$300 to \$435 per ton.

Arizona.

BRADSHAW.—Prescott *Miner*, April 8th: Parties coming to town for tools, etc., bring good news and rich rock. Brooks & Hinkle had sunk a shaft 20 feet, on the Lion lode, at which depth the pay streak was over seven feet thick. Water had commenced to seep in at the bottom.... Moreland & Co. were sinking and drifting on Tiger discovery, and had a rich rock above, below and on every side.... T. H. Head was sinking on his extension of the Tiger. He was down 18 feet, and had a good ledge.... Aleck Harris and partners were hard at work on their portion of the Tiger tunneling.... Work upon the Eclipse, Congar, Badger, and other lodes in the "Eclipse belt" was being prosecuted, and a great deal of rich rock was being hoisted to the surface.... The owners of gold ledges—Hunter, Del Pasco, Espinosa, etc.,—were making them shell out.... The placer miners in ravines leading from the Del Pasco, were packing the gravel 300 yards to water, panning and rocking it, and making from \$5 to \$15 per day.

HASSAYAMPA.—The Davis is the only ledge upon which any work is now being done. When Mr. Davis left for town, 40 tons of good ore were out, and the ledge was looking splendid. All the placer miners are doing well.

Big Bug mill was running on good ore. In Wickenburg, the Vulture Co.'s 40-stamper was running on rich rock.

Idaho.

ITEMS.—*Avalanche*, April 8th: Chas. Peck has discovered another rich gold-bearing quartz ledge, running from Web-foot gulch eastward across War Eagle. It has been named the "Udola and Tahula Peck.".... The Mahogany case was adjourned till nine o'clock this morning.... The water has been turned into the Florida mountain ditch, and Sommercamp & Co., are preparing for placer mining.... Sanfils & Co. are down 70 feet on the Illinois Central and drifting both north and south of the shaft.... Wells, Fargo & Co., shipped from here this week eleven bars of bullion, valued at \$28,218.80.... The Oro Fino mine is said to be looking well and yielding rich ore.

Montana.

STERLING.—*Montanian*, April 6th: Mr. Cope's shaft on the Pony lode is 325 feet deep, and last week he was forced to suspend operations on account of water coming into the works. He has worked three eight-hour shifts of men the entire winter. He was loth to suspend just as he was (as he thinks) getting to a depth at which the ledge would concentrate and open out into rich ore; but the machinery was insufficient to keep the shaft clear. He will try again in the dry season. Col. Peck reports Snyder's mill running on Red Bluff ore, with good returns. Malory & Lown are preparing to put a force of men on their rich claim on the Red Bluff lode. Mr. Merk is preparing his mill for work and sinking on the Boaz lode.

New Mexico.

The Santa Fé *Post* of April 8th says:—We understand that the Harpending Co., which claimed a large interest in the Ralston mines, has ceased operations and that all its employes have left. The Willison Silver Mining Co., composed of citizens of our Territory will, however, continue operations.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., April 20.

The stock market has been irregular this week with a fair demand. Amador has sold for \$360, and \$380 and \$390. Eureka was quoted at \$81 to \$82½.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock:

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 4TH.

SWIVEL FOR TETHERING ANIMALS.—William Lyon, Camp Halleck, Nev.

ELECTRIC GAS-LIGHTING AND EXTINGUISHING APPARATUS.—John Vansant, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

CLOSET VALVE.—A. J. Smith, San Francisco. All persons who have had any experience with water closets, especially with public water closets, have found how extremely difficult it is to keep them always in a proper condition. Whenever any mechanism is left to be actuated by the user, it will be thrown out of order in a short time, for there is a certain class of individuals who seem to be utterly devoid of any ideas as to the proper management of machinery, and who misuse it in the worst manner. Mr. Smith's device is automatic, the valve being operated by the weight of the person, and his invention will undoubtedly be welcome to many as something which will save money, and insure to the peace of mind of those who are apt to get excited over useless damages, resulting from want of common sense on the part of others.

GRINDING PAN AND AMALGAMATOR.—W. H. Thoss, West Point, Calaveras Co., Cal. This improved grinding and amalgamating pan for gold and silver ores is constructed in sections, so as to be easily transported from one place to another, or to points difficult of access. It has a vertical revolving shaft with horizontal arms, to which are loosely attached peculiarly shaped stone grinders. These are drawn over the bottom, and also thrown out against the sides of the pan, when in operation, so as to thoroughly grind the ore, while, by their peculiar shape, the mercury and pulp will be forced to the center. An adjustable scraper is attached to the arms, and by depressing this, the mercury will be again drawn from the center through the pulp. By this construction, besides the smaller expense of manufacture and ease in transporting, it is sought to effect a more thorough exposure to the metals to the different active influences, and the more intimate mixture of pulp and mercury than is usually obtained.

SAFETY BRIDLE.—J. Weatherhead, San José, Cal. This improvement relates to that class of bridles in which face straps, which are secured to the rings of the bit, pass up over the head of the horse and between his ears. Here the two face straps are attached to a ring upon the top of the horse's head. Short straps then connect from this ring to the bridle reins upon each side, which serve the same purpose as the side straps of the ordinary bridle. Besides these straps, there is attached to the same ring a single rein, which passes to the hands of the driver, and enables him instantly to throw the horse's head in the air by a slight pull, and prevent him from running, kicking or doing other damage. The device is exceedingly effective, and puts the horse entirely under the control of the driver or rider, as a pull on the strap, at the first indication of unruliness, will put the horse out of condition to kick or run away.

ADVERTISING LAMP.—E. Boesch, San Francisco. This lamp is a most neat contrivance which is very ornamental, and cannot fail to attract attention to the advertisement thereon. It is nicely arranged, and brings out the names, etc., very prominently, being useful both in the day time and at night. The invention includes as well an improved device for securing the glass plates of the lantern.

MISCELLANEOUS.

Travel in Second-Class Cars.

EDITORS PRESS:—As we have much pride in the good name that the young and growing State of California should bear, I will endeavor to point out one step that we as well as the older States are taking, which it would seem a little thought might show unprofitable and ungenerous, if not inhuman, wicked and immoral in its tendency. I refer to second-class railroad travel. The most of the roads have provided themselves with a plain, cheap car for each passenger train, to which they invite the emigrant, the common laborer, and all who may feel, from necessity or otherwise, obliged or inclined to economize. That is all well.

Now we would invite the readers attention to the daily picture presented in this second-class car. The outside appearance is quite plain, needing no other sign to indicate to the traveler which one in the train it is. As you enter you find plain seats, may be cushioned, and may be plain boards, with equally cheap finish of inside work generally.

That too, is all well. Seated in this plain car may be seen men of all nationalities, and possibly among them as pure hearts as can be found among the passengers of the cars before or behind them. We also find lady-like looking young women and quite frequently the mother with her precious charge of children, with a heart yearning for good influences to aid her feeble hands in teaching sobriety, good language, and decorum.

But the opposite is true of the picture which this car presents. It is made the receptacle of all the bold drinking, profane language, and unmitigated old pipes, and segars, struggling over each other for mastery in the amount of smoke they may be able to get into a small coach. To add further to the imposition on the better portion of the inmates of the befogged car, many passengers from first-class coaches feel an apparent pride in retiring to a second-class car to indulge in all those ungentlemanly and filthy habits.

We believe this state of things is unprofitable to railroad companies, as it is certainly unpleasant to many who travel in such cars. It drives many of the better class of poor from these thoroughfares and we believe its reformation would be attended with results similar to those which were noticed in the reform of the postal system. When the Government charged twenty-five cents for letters the poor could send but few, making very limited interchange of thought, and not paying mail expenses. But when the postage was reduced to three cents, a revenue sprang up. All can now afford the gratification of a correspondence.

Now suppose the same watchfulness by the conductors in the second-class car, as in the first, in regard to etiquette. The mighty people, the masses, would travel; gaining information and paying back in cash. All railroad men who become instrumental in abating the nuisance complained of, and aiding the poor, but high-minded, to travel in your plain but respectable second-class cars. **WAY SIDE.**

A BAD CONDITION.—Reports and counter-reports of the excesses committed by the striking coal miners of Pennsylvania have been sent to our coast. Exactly the truth, it is difficult to ascertain. So much, however, is certain,—that the condition of things there is very bad. A Philadelphia cotemporary places the matter in a strong light as follows:

A dead lock among the politicians at Harrisburg—a dead lock among the coal producers in the Anthracite region—the iron manufacture half extinguished for want of fuel; and the coal yards empty—Philadelphians begin to envy the happy state of the capital of France, where there only exists a slight unpleasantness between the German guarantee-garrison at St. Denis, the French Republican garrison at Versailles, and the gendarmes of the Commune at Vincennes—to which are added some massacres in the Place Vendôme—some cannon on Montmartre pointed at the Hotel de Ville, and some threats in the Hotel de Ville against Human Society. France and Pennsylvania exhibit at one and the same time what irreconcilable antagonisms may live and grow in the very heart of civilization.

Diamonds for Cutting and Drilling.

It is said that when diamonds are used in cutting hot glass in a glass factory one will last for only a single day. It gradually assumes a milky appearance and becomes worthless; but if the glass be cold the diamond will last for many months. Very small diamonds are used for cutting glass.

Diamonds which are used in the diamond drilling machines are about the size of peas, presenting irregular, smooth surfaces, but more or less opaque and lacking in brilliancy, and having slight, smooth indentations.

It is said there is no perceptible wear to the diamonds, in the work of drilling, notwithstanding the hard and rough work it has to do. Their destruction is caused mainly by the act of "setting." They are set in the drill, into holes which have been previously drilled, in the ordinary manner. Each hole is made as near as possible to the size of the diamond it is to receive, and the stone is secured in its place by so battering the steel around it as to hold it tight. An unlucky blow, in this work, may greatly injure the stone by breaking off a fragment, or entirely destroy it by reducing it to small fragments.

When they are properly and carefully set they can be used until the steel in which they are imbedded has become so worn away by the attrition of the "chips" or "dust," from the rock, in the process of drilling, that the diamonds become loose or nearly so. If the setting is not watched with the greatest care, the diamond is liable to work out when the drill is in motion, in which case it is soon destroyed.

We have seen diamonds that were said to have been in almost constant use for months, on hard rock, which yet showed no perceptible wear. The small indentations so common in their surfaces had not even been ground out. A little diamond dust dropped into the drill hole, or the breaking and grinding up of a diamond from the drill while at work, would soon tell upon those that remained in their settings. The diamonds employed for this purpose generally cost from \$8 to \$12 each.

Toads After a Shower.

"Why," asks "Courant, Jr.," "during a shower, and in the midst of it, do such multitudes of toads, and especially little ones, hop out on the gravel walks?" For many years I believed that they rained down, and I suppose many people think so still. They are so small, and they come in such numbers, that the supposition is not unreasonable. "Thick as toads after a shower" is one of our best proverbs. I asked an explanation of this of a thoughtful woman, indeed a leader in the great movement to have all the toads hop in any direction without any distinction of sex or religion. Her reply was that the toads come out during the shower to get water. This, however, is not the fact. I have discovered that they come out not to get water. I deluged a dry flower-bed the other night with painful after painful of water. Instantly the toads came out of their holes in the dirt by tens and twenties and fifties to escape death by drowning! The big ones hurried away in a ridiculous streak of hopping, and the little ones sprang about in the wildest confusion. The toad is just like any other land animal. When his house is full of water he quits it, and seeks more comfortable quarters.

A CURIOUS ANT.—Probably the most curious ant in the world is the parasol ant of the West Indies. Dr. Forbes Winslow, in his work on light, says these ants walk in long procession, each one carrying a cut leaf over its head as a parasol, in the sun, and they deposit these in holes ten or twelve feet under ground, apparently with no other object than to form a comfortable nest for a species of white snake, which is invariably found coiled up among them.

WOOD ENGRAVING.—Thirty years ago there were not twenty professional wood-engravers in the United States; there are now four hundred. There are thirty-five engravers in steady employ at Harper's, and sixty-eight at Leslie's. In 1869 eighteen thousand wood-engravings were prepared for Mr. Leslie for which \$180,000 were paid.

Land Decision.

About two weeks since, says the *Union*, the United States Surveyor-General requested the Register of the United States Land Office, at Sacramento, to suspend from entry and sale all lands situated upon the east half of township 7 north, range 10 east, which includes Amador City, also the Keystone, Amador and other mining claims of much value, all having claims pending in the Sacramento Land Office. The Register was of opinion that the proceedings could not be suspended, as in cases where lands were claimed as swamped lands, by order of the Surveyor-General, and proceeded to take proofs, notwithstanding the request of suspension, but awaited instructions before making sales. It will be seen by the following letters just received by the Register, that the land intended to be affected by the suspension is not to be deemed suspended, but is to be considered as though it had been returned upon the township plat as mineral land, until otherwise ordered. Wherefore the Land Office business will proceed relative to that township with the exception above specified, the same as before:

The letter to the Register reads: "You will permit none of the land embraced within the east half of said township to be disposed of as 'agricultural,' until further instructed, unless the non-mineral character of the tract applied for be first established in the manner required in cases where the land has been returned as mineral, for upon which affidavits have been filed allowing its mineral character."

That to the Surveyor-General states that payment for the survey having been made, no suspension can be now affected. "The necessary entries have been made, however, upon our records to prevent the disposal of any tracts embraced within the east half of said township until the mineral or non-mineral character of the same shall have been fully established, and the Register and Receiver of the District are authorized to receive testimony respecting any portion of said township in the usual manner."

ROAD WITH SINGLE RAIL.—Mr. J. L. Hadden, C. E., of London, has devised a single-rail tramway for conveyances in mountains and thinly peopled countries, of which he gives the following description: "Imagine a bicycle let in a longitudinal aperture in the center of the bottom of a cart, and the cart nearly touching the ground, so that only about six inches of the wheels would be visible; next, a kind of balancing pole run through the sides of the cart at right angles to the single rail on which the bicycle is to run. The two ends of the pole are to project about three feet on either side of the cart, and rest upon, and be harnessed to the backs of two mules. The animals will thus be one at each side of the load, instead of being in front in the ordinary way. It would be impossible to turn over, because, in order to do so, it would have to force one mule to the ground and to lift the other in the air; and, moreover, as its floor would only be six inches above the rail, an overturn would be of no account. All the weight in the cart, if evenly distributed, would bear upon the rail, and the animals having no load upon their backs, would be able to exert considerable tractive power."

CURIOSITIES OF SOUND.—The whistle of a locomotive is heard 3,300 yards through the air; the noise of a railroad train, 2,800 yards; the report of a musket and the bark of a dog, 1,800 yards; an orchestra or the roll of a drum, 1,600; the human voice reaches to the distance of 1,000 yards; the croaking of frogs, 900 yards; the chirping of crickets, 800 yards. Distinct speaking is heard in the air from below up to a distance of 600 yards; from above, it is only understood to range of 100 yards downward. It has been ascertained that an echo is well reflected from the surface of smooth water only when the voice comes from an elevation.

ENDURING WOOD.—Pliny states that the cedar woodwork of the Temple of Apollo, at Utica, was in a perfect state of preservation after an interval of two thousand years. The famous statue of Diana of the Ephesians, was formed of cedar, and endured for many centuries. The ancient Egyptians extracted an oil from the cedar wood, which they rubbed over the papyrus to preserve them from worms, and which also entered into the composition used for preserving their mummies.

THE MOST RAIN, noted within a year, on this continent fell at Baton Rouge, 1846, being 116.6 inches, for the year. The least noted fell at Fort Yuma, Cal., being 1.78 inches, for the year 1853.

Silk Culture.

During the past planting season, more mulberry plantations have been set out in this State than in any previous year. But more care, skill and prudence are now being exercised, and we may be allowed to hope that better results will be obtained than have been achieved heretofore.

We may be allowed to remark upon the unfortunate circumstances connected with the initiation of silk culture in our State. The first eggs imported and used here were from France. They were of the variety known as the European Yellow Cocoon or French worm. This variety of worms was introduced into France in the 14th century, and up to a very recent period, at least to within twenty years past, it was the great study and care of the French people to keep them pure and unmixed with other varieties.

Thus it will be seen that for centuries they were bred in and in, and all Franco and Italy were stocked with silkworms of one common origin.

Is it any wonder then that the silkworms of France and Italy became weak and diseased? Is it not rather a wonder that the kind did not become extinct, centuries ago?

Practice of the Chinese and Japanese.

The practice of the Chinese and Japanese has been entirely different. They have kept up a constant mixing and interchange of worms from different localities and of different varieties. All who have had any experience with worms imported from those countries must have become convinced of this fact, as there has never been a lot of eggs imported into the State from China or Japan, that did not prove to be a mixture of some three or four different kinds, including annuals, bivoltines, and trivoltines. The first lot of Japanese eggs hatched in the State, were presented to Mr. Prevost by a Frenchman in 1866, and were hatched and fed by him in the Pavilion at Sacramento, in 1867. They proved to be bivoltines and were the first of that kind of worms he had ever seen or heard of. We do not remember to have seen a man much more surprised and astonished than he was, when some eight days after he had packed away the eggs made from them, he found them all hatching again.

Since that date, we have hatched and raised more or less worms from eggs imported from Japan each year, and all have been more or less composed of mixed varieties. In addition to this evidence of the practices of these people in reference to this subject, we are informed by the most intelligent Chinese silk-growers in the State, that it is the annual custom to interchange eggs between China and Japan, and that many of the eggs heretofore shipped from Japan to Europe have been produced in China. The Japanese Merchants buying them in China and making a good profit in the trade.

From the same source we also learn that the Chinese have a way of making any silk eggs hatch as many times in a year as they desire; and that in the southern portions of China they make as many as six crops of silk in a year. Their worms frequently spin these cocoons in eighteen days from the day of hatching. The nights being warm, they have no recourse to artificial heat, but keep up the feeding during the night, as regularly and plentifully as in the day time. This accounts for a universal disposition among the Chinese to over feed the worms here, where the climate, and especially the nights are cooler. They, or many of them, cannot understand why the worms do not eat as rapidly in California as in China. This is the most serious objection to the employment of Chinese in cocooneries, and those who do employ them will do well to watch them in this respect very closely.

Chinese Secret.

The art of forcing the eggs to hatch at pleasure is a great secret among the Chinese, and it is said only a few are able to practice it with success. It is, in fact, a sort of profession or special gift, those who are masters of the art being looked up to as men of some superior endowment. They go about the country practicing the art and commanding very great fees for the same.

We have met but two Chinamen in this State who had any pretensions to a knowledge of the art, and when they were called upon to put it in practice both failed. They attributed their failure to a want of practice in the climate of California, which, they said, being different from that of China, where they had practiced the art, required that the eggs should be treated accordingly, and it might require many

trials before meeting with success.

The plan of operation is as follows:—While the moths are laying, they are confined very closely under a dark covering. When this operation is finished, the moths are thrown away and the eggs remain covered until the next morning early, or about twelve hours from the time they are laid. At this time they are dipped, together with the cloth to which they are attached, into warm water for a certain length of time; then taken out, dried in a warm place until they hatch, which they say should be in about eight days. The secret of success is said to be in the relative degrees of heat in the water and atmosphere, and the length of time that the eggs should be held in the water.

Although the experiments we have witnessed failed to make annual eggs hatch like bivoltines, in the same seasons they were laid, yet the change in color and form through which such eggs passed, was much more similar to the changes that usually take place in bivoltine eggs than those annuals. So much so that we are of the opinion the thing can be successfully accomplished.

The Freezing Process.

Reason would lead us to adapt an entirely different process to arrive at the same result—the forcing of annuals to hatch twice or more in the same season, from that practiced by the Chinese. It would seem that if annual eggs were artificially put through a succession of degrees of heat and cold, similar to those of the seasons, they might be made to hatch the same as they do upon the return of spring. We have never tried or seen this experiment tried, but are assured that it has been successfully accomplished both in France and America. We can see no reason why an artificial winter and spring should not bring about the same changes in the eggs as a natural one.

The Advantages.

In this State where the seasons are long enough to produce two crops of silk, and the trees produce sufficient foliage for that purpose, it would prove of great advantage to be able to hatch the annual eggs the second time, since the annual makes so much stronger and better cocoons than the bivoltines or trivoltines. It would give us a double crop each year, and would more than compensate for any disadvantages we now labor under in consequence of high priced labor.

VICTORIA AND HER LOVE.—Referring to the mausoleum erected at Windsor to the memory of the Prince Consort by his wife, at a cost of £110,000, a correspondent says: Each day Queen Victoria visits this place alone. Near the tomb is placed a large, deep basket, filled with wreaths of beautiful flowers. At hand is a small round table, on which are a Bible and a prayer book. From these she reads and prays fervently, kneeling the while. Then she rises, and taking the wreaths, advances towards the sarcophagus, in the lid of which a small sheet of plate glass is inserted, through which she can see the face and form of the departed. But the efforts of the embalmer have not been thoroughly successful, and the features that were so beautiful in life are, in death, marred by discoloration. Still it is his face, shrunken and pallid though it be. Again she prays, thinking of the years of happiness she lived with him, long passed away, but never to be forgotten. She stands gazing there till she can gaze no more, with tears. Gently she places the forget-me-nots upon the marble coffin, takes one last lingering look with her dim eyes, and slowly retires, while from above the bell tolls out a melancholy requiem for the idolized dead.

GASES EVOLVED BY RIPE FRUITS.—According to Lechartier and Bellamy, picked fruits—such as apples, cherries, and gooseberries—at first absorb oxygen; afterwards they give off carbonic acid, and in larger volume than the previously absorbed oxygen. At first the evolution of gas takes place uniformly, afterwards it moderates, and then ceases for a time, and commences again and gives off more gas than during the first period. An increase of temperature promotes the transformation. Whether light has any influence upon the reaction is not stated. From these observations it will appear that it is unsafe to sleep in apartments where much fruit is stored.

THE BOSTON *Journal of Chemistry* thinks that the introduction of coal oils for lubricating purposes, has diminished the danger of spontaneous combustion, inasmuch as these oils have not the property of absorbing oxygen which is possessed by animal oils.

GOOD HEALTH.

A Lively Medical Application.

The *Medical and Surgical Reporter* publishes the particulars of a lively medical application, which we condense as follows:

A physician in Ithaca, N. Y., was called to see a colored woman, who was afflicted with severe intestinal pains. After administering the usual cathartics, and trying ordinary injections without any result, he came to the conclusion that there was some unusual obstruction in the small intestines which no ordinary treatment would remove. This opinion was strengthened when severe vomiting set in, with regard to which her attendant nurse remarked, "Dat what de nigger vomited smelt juss liko what orter gone de odder wa'."

Only two remedies were then suggested to his mind—opening the abdomen and removing the obstruction, or the novel idea of an injection of *Seidlitz powders*. He finally resolved upon the latter as a possible means of avoiding the necessity of the former, and gave particular directions to have the two papers dissolved and used separately.

That times were quite lively in that room after the administration, may be inferred from the following words of the patient, employed in describing the result to the doctor on his subsequent visit:—"Golly, docta, I had de greatest feelin' in my inwards you ebber herd on; drefful martin', grumblin', growlin' and sich, till I tho't I should bust; den de bowels moved so quick I could hardly git out of bed 'fore chery thing inside seemed to fall down, like as if de hottom had dropped out!"

It is needless to add that the patient speedily recovered. The trouble was thought to be a spasmodic action of the intestines, by which a portion above was made to slide into a portion below; an action brought about by leaning and laboring over the wash-tub. We believe the above mode of administering *Seidlitz powders* is something new in the annals of medicine; but the result fully demonstrates its utility.

DUST SPECTACLES—GOGGLES—NOT GOOD.—Wire-work in spectacle frames was at one time used as such, and called by this name. These dust spectacles have the disadvantage of keeping the eye behind them continually enveloped in the vapor of its own moisture, which cannot fully escape. Thus, the irritated condition is rather increased than diminished. The principal reason for their disuse lies, however, in the impairment of distinct vision, which compels the patient to strain his eyes severely in order to see surrounding objects distinctly. By the wire-work considerable objective light is kept away from the eye, and the frame of the dust spectacles places the translucent gauze in an unfavorable angle to the outer world, thus limiting the visual field; moreover, the manifold diffraction, which the transmitted light undergoes on the wire-gauze, comes into consideration. Besides, when these spectacles are worn in an atmosphere loaded with dust, the meshes of the gauze become filled, and then their defects are increased. Ordinary glass spectacles of circular shape, about an inch in diameter, are to be preferred to the dust spectacles above described. Of course they protect the eye less; but where the dust is so abundant that sufficient protection is not afforded by the ordinary glass spectacles, or where a small amount of dust upon the eye proves injurious, the surgeon does well to prohibit the patient from being thus exposed.

SLEEPLESSNESS AND INDIGESTION.—"How should sleeplessness in a very young babe be treated? also, what will cure indigestion and acidity of stomach?"

Cure the indigestion, and the sleeplessness will disappear. To do this feed the baby less frequently, and do not allow it to take any thing whatever into its stomach except milk, and that only at certain stated times, not less than three hours apart. If the acidity does not soon disappear, extend the time to four hours. Be sure and be regular in the times of feeding. It is very important.—*Herald of Health*.

How to Prevent Spring Sickness.

There are a great many people who are subject to a "bilious attack" every spring, and who expect it as a matter of course. Now there is no more need for people being thus sick in the spring, than at any other time of the year, if they only know how to live. This periodical sickness can be prevented simply by regulating the diet. Not that all persons who have been subject to such attacks year after year, for a long time, can overcome the difficulty at once. We are all such creatures of habit, that when any thing becomes established in this way, there is a strong tendency to its return at the regular time, even after the producing cause has ceased to operate; consequently in bad cases it sometimes takes several years to overcome it entirely. Under a proper regimen the attacks will grow less severe every year, until they entirely disappear.

During cold weather, people eat larger quantities than usually of carbonaceous food, such as fat meats, sugar, butter, bread, cakes and other preparations of white or superfine flour, nuts, fats, syrup, etc. Of course, a much larger quantity of carbonaceous food is required by the system in cold weather than in warm, but as a general thing people eat too much of it, clog up their system with the excess and overburden the excretory organs, particularly the liver, in vain efforts to get rid of it. These who take a great deal out-door exercise are usually enabled to work it off, and seldom suffer much in consequence, except in hot weather; while those who lead a sedentary in-door life suffer most. When warm weather comes on in the spring, people require much less carbonaceous food, but instead of changing their diet as the weather changes, they continue to eat the same kinds of food—they have been eating during the coldest weather of the winter, and the consequence is that the already overburdened liver is unable to bear up under this extra load, and utterly refuses to perform its function until it has had a chance to rest and to throw off its accumulated burdens. Now to prevent this state of things two things are necessary. First, people must eat a less portion of carbonaceous food at all times. Second, as the weather grows warmer in the spring they must eat a much less quantity of it than they do in cold weather, and substitute instead more vegetables and acid fruits. Every family should have a larger supply of canned fruits and green vegetables to use at this time of year. For a single article there is nothing so good as tart apples, and they should be used in unlimited quantities.—*Herald of Health*.

SICK ROOMS: DECISION AND QUIETNESS. Consult your patient's wants, but consult him as little as possible. Your decision need not be very obvious and positive; but it is the triumph of supremacy to become unconsciously supreme. The decisive nurse is never peremptory, never loud. Though quiet, she never walks tip-toe; she never makes gestures; all is open and above-board; her shoes never creak. Her touch is steady and encouraging. She never looks at you sideways. You never catch her watching. She never slams the door, of course, but she never shuts it slowly, as if she were cracking a nut in the hinge. She never talks behind it. She never peeps. She pokes the fire skilfully, with firm, judicious penetration. She caresses one kind of patient with genuine sympathy; she talks to another as if he were well. She is never in a hurry. She is worth her weight in gold, and has a healthy prejudice against physic, which, however, she knows at the right time how to conceal.

TREATMENT OF INFANTILE DIARRHŒA.—Dr. R. W. Foss, in the *British Medical Journal*, recommends the use of the powder or mucilage of gum-arabic in the diarrhœas of infants. When the stools are green or pure fluid and involuntary, he adds gray powder in the proportion of one part to twenty of the prepared gum, of which five grains are given as a dose. When there is simple diarrhœa, with foetid stools, one part of the mucilage to three of water is all that is required.

YOUNG CANTHARIDES.—It is said that the young, immature cantharis insect does not possess any considerable blistering properties. That power is possessed by the adult only.

SAYS the celebrated Dr. Boerhave, keep the head cool, the feet warm, the bowels open, and the aid of a physician will be seldom needed.

Gold and Legal Tender Rates.

San Francisco, Wednesday, Apr. 18, 1871. Legal Tenders buying @90½; selling @91. Gold in New York to-day 114.

Table of Contents.

Two Free Universities; The Prize Mower; Ill; Reception of Mr. W. H. Webb.....	241
MECHANICAL PROGRESS.—Hydrostatic Pressure on Steam Vessels; American and English Engine Building; Compressed Air in Mining; Blast Furnace Engine; Spike-Making Machine.....	242
SCIENTIFIC PROGRESS.—The Bessemer Flame; Sun Spots; Vision under Water; Fossil Cetacea; Thickness of Sedimentary Rocks. 242	
Flint Creek, Montana; Eclipse M. Co., Inyo County; Transcontinental Traffic; Banner District.....	242
MINING SUMMARY; Shareholder's Directory; Market Rates.....	244, 245
List of Patents; Notices of Recent Patents; Travel in Second-Class Cars; Toads after a Shower; Land Decision; Road with Single Rail.....	246
Silk Culture; Good Health.....	247
Dry Concentrator for Placer Sands; Working of Ores at the Auburn Mill, Reno; The Oroville Bridge.....	248
Printers' Cemetery, Ill; Borax; Cal. Wagon Manufacture; Willard Furnaces.....	249
Eating Raw Meat; The Pot on the Fire; Philosophy of Eating; Domestic Receipts; Mechanical Hints.....	250
New Books; Important Railroad Sale; Utah Mines; Narrow Gauge.....	252

MECHANIC ARTS COLLEGE LECTURE.

The lecture to-night before the Mechanic Arts College should not be forgotten. It will commence at 8 o'clock promptly. Prof. Kellogg will commence his course of three lectures.

Dry Concentrator for Placer Sands.

Mr. Frederick Valentine showed us, last week, at Clerc & Co.'s City Foundry, on Fremont street, an ingenious air-concentrator for placer sands. The machine consists of two concentrators driven by horsepower. The sands are dried in simple furnaces, sorted on sieves, and then concentrated by air. The one now being constructed is for use in San Diego county. A similar machine has been tried in several parts of this State and in Mexico with great success, we are told.

One of the double machines will concentrate 100 tons of sands in 10 hours. The average of the sand worked has paid about 50 cents to the ton, while the expense is about 15 cents per ton. This would indicate that the concentrator will be found a valuable device in many places, and will enable poor placers to be worked which otherwise would be unproductive. A similar machine has been used for separating sulphurets. The apparatus is light, simple in construction, durable, and easily moved from place to place. Mr. Valentine has had extensive experience in workings of the kind for which his invention is intended, and believes that he has a valuable device. He operated his machine a few moments while we were present, when it worked very satisfactorily.

METROPOLITAN GAS COMPANY.—On Tuesday, this company commenced laying their mains in this city. The company will manufacture entirely from California crude petroleum, by the Gale and Rand process. By their franchise, they can charge only \$3.50 per 1,000 feet. The Pacific Foundry is engaged in casting 8-inch pipe for the company, and have already turned out over 2,000 feet and are making it at the rate of 150 feet per day.

Working of Ores at the Auburn Mill.

[BY OTTO KAR HOFMANN.]

The successful treatment of rebellious silver ores, as well as a conscientious and able business management, secured to the Auburn mill, near Reno, Nevada, not only a good name, but also the well-merited confidence of customers; and it might be interesting to some readers of the SCIENTIFIC PRESS to learn the method of manipulation of that mill, which is the property of the Nevada Land and Mining Company, with head-quarters at London, England. The present Manager and Superintendent is F. F. Osbiston, Esq., under whose skillful direction the good name and efficiency of the establishment will be still more promoted.

A favorable locality admitted the erection of suitable and practical reduction works. There is a very capacious ore and sampling-house, a 20-stamp battery, twelve Varney's pans, six settlers, and, in an adjoining department, a boiler and retorting furnaces. All parts are so arranged, one above the other, as to avoid the handling of ore. On the left side of the battery there is a Stetefeldt roasting furnace with a feeding apparatus, taking the ore direct from the batteries. The cooling floor of the furnace is on the same level with the pans. The motive power, taken from the Truckee River, is abundant, summer and winter, supplying an overshot wheel of 34-foot diameter and 22-foot face.

Sampling the Ore.

A very important question, requiring great care in a custom mill, is the sampling. In order to obtain a true result of the assay, the small quantity of ore taken for this purpose must contain the same amount of precious metals proportionally as the whole mass from which it was taken. For this reason, the sampling requires great precision, cleanliness and order. A correct proceeding is troublesome and expensive, but indispensable in order to satisfy the customers and the mill management itself, and also to ascertain the real percentage of the value extracted. A neglect in this operation is generally followed by very disagreeable consequences.

The first requirement for the purpose of sampling is the reduction of the mass to a uniform small size. It is not necessary to have the whole mass reduced to a fine pulp. This must be avoided for several reasons. It is an erroneous supposition that sampling before the battery during the crushing is the most proper way. It is incorrect for these reasons:

1st. The sampling must be trusted to the workmen, as it requires from 6 to 48 hours or more, according to the amount of ore, before the whole lot is crushed up.

2d. The ore is mixed with the necessary percentage of salt before crushing, in order to have it roasted in the Stetefeldt furnace. In making the assay, this salt must be taken into account after the amount of its water has been ascertained. The same applies also to other chemicals or ingredients mixed with the ore on account of base metals. Although this rectification shows no special difficulty, it is sometimes, nevertheless, a source of mistakes.

3d. If samples are taken at regular intervals, a somewhat uniform mixture and quality of ore is anticipated, which seldom exists in reality.

4th. In case there is gold, native silver or chloride of silver in the ore, a good deal of it will remain in the battery, causing a poorer sample. Besides this, the owner of the ore is bound to wait for the returns till all his ore is crushed and pulverized, while only a few hours are required to finish the sampling in a different and more reliable way.

At the Auburn mill, the sampling is performed in the same way as in Swansea and Andreasberg (Hartz) with rich ores. The ore is broken first to the size of a walnut and spread out uniformly, on a clean platform, in a flat, square pile. Then four canals are made, crossing each other. From the ore obtained from these canals, a smaller flat layer is formed, similar to the former. The canals must be made down to the floor, and nothing left therein. Each canal-stuff is then spread on the floor, covered uniformly with the ore of the next canal, and so on until all four are finished. From this a third heap is formed by canal-cutting, and the process is continued in this way until the pile is reduced in weight to about 100 pounds. This is crushed finer—to the size of a bean—spread again flat, and from 40 to 50 pounds taken as before

and ground to a fine powder. It is then delivered to the assay office, provided with the proper label. This quantity, by a similar operation in the assay office, is reduced to about one pound.

Assaying the Ore.

In order to ascertain the moisture in the ore, a certain quantity of the sample is dried in a porcelain dish above an alcohol lamp, on a sand bath, at a temperature not exceeding boiling heat, until a cold glass plate, kept above the sample, does not appear coated with precipitated vapor. Two weighings taken at short intervals must agree. The required temperature is easily observed and regulated, if the sample is continually stirred with the quicksilver end of a thermometer, the temperature indicated being carefully observed. The loss of water is then proportionately subtracted from the ore, as the sample subjected to the assay is of the same dryness.

One pound of the sample, for the purpose of assaying, is dried in an iron pan, above a slight charcoal fire, the temperature being regulated in the same way, by the use of the thermometer. The dry sample is then divided into two equal parts, one of which is given to the owner of the ore, the other kept in the office after the assay sample has been taken therefrom. From each sample two assays are made, the result of which must correspond exactly, otherwise a third or controlling assay is made. From ores containing less than \$300 per ton, half an ounce is taken; from richer ore only one fourth of an ounce, in order to avoid a larger loss of silver in cupellation. In case the shipper of the ore should get a higher yield of his duplicate sample, if assayed elsewhere, the reserve sample is then sent to one of the prominent assay offices of San Francisco to decide the question. Should there be a difference in favor of the shipper, it would be remitted to him. Such reclaims, however, are very seldom, have occurred only twice, and in each case the mill assay was correct.

As soon as the value of the shipment is ascertained, the due amount for the ore is paid up to the owner. The use of the Stetefeldt roasting furnace free from royalty, the excellent water power and other advantages enable the establishment to offer the highest prices for ores of every description. The price tariff is published in most of the newspapers. The shipper is always invited to be present at the sampling of his ore.

Roasting the Ore.

The roasting of ore is performed in the Stetefeldt furnace, the best and simplest amongst all furnaces known. The description of this furnace has been given in the Press and other scientific journals. A detailed description of the furnace and the proceedings in roasting will be found also in Kustel's book on the "Roasting of Gold and Silver Ores."

It is the most important advance that our young metallurgy of silver ores can show. The influence of the Stetefeldt furnace on mines of low-grade ores will soon be apparent. The manipulation is simplified, the result improved, expenses reduced and efficiency greatly increased. From 25 to 30 tons of ore, and more, can be roasted in 24 hours with one single furnace by the aid of six workmen, without skill or experience, to the best advantage, replacing 15 common reverberatory furnaces, employing about 90 men, who must understand roasting. The roasting itself in the Stetefeldt furnace is entirely independent of the workmen, whose principal business is to keep up a steady fire, attend to the feeding machinery, and draw the roasted ore out of the furnace.

Extent of Chlorination.

The roasting expenses are not over \$1 per ton of ore. Eighty-seven to 95½ per cent. of the silver is transformed into a chloride, according to the character of the ore. Having the assay department in charge, I have had opportunity to inform myself of the result of roasting of different kinds of ores. Cupriferous silver ores give a better result in roasting than plumbiferous, as is the case also with the reverberatory furnaces; but while ores containing lead are difficult or even impossible to be treated advantageously in a reverberatory furnace, the Stetefeldt chloridizes 87 per cent. of the silver, if there is 20 per cent. of lead in the ore. Is less lead present, the chlorination comes up to 91½ per cent. I have had no occasion to observe how ore would behave containing more lead than 20 per cent. Is the amount of lead too high, it happens that a partial clotting of the mass occurs while accumulating at the bottom of the furnace, which, however, can be avoided easily by adding to the ore some charcoal during the crushing. The

charcoal acts only mechanically, preventing the immediate contact of ore particles. No lead is reduced thereby.

The chlorination of the silver I found to be 87 per cent. from very base ore holding a high amount of lead; the highest with cupriferous ores was 95½ per cent. The average of all assays of this kind showed 91½ per cent.

The greatest part of the chlorination is effected during the free fall of ore through the glowing chlorine-atmosphere. The finishing occurs while the stuff is lying at the bottom of the furnace. According to this, an arrangement for permanent drawing of the roasted ore would grow injurious. For the same reason, at the Auburn mill, the feeding is stopped during the discharge. At the moment the ore reaches the bottom, it shows from 19 to 27 per cent. less chloride of silver than if allowed to remain till about a ton or so is accumulated.

Of cupriferous ores, I found that, if the ore assayed 12 per cent. in copper, 22 per cent. of it volatilized into the condensing chambers, 10 per cent. remained in the ore as a chloride and subchloride, and the balance turned into an oxide.

Of ores containing lead, I found from 20 to 60 per cent. less had in the ore after roasting. For this reason the bullion from base ores is seldom below 600 fine.

The roasted ore is changed as usually about 800 pounds at a time, and amalgamated for six hours. The amalgam is re-torted, and the bullion assayed in the wet way after Guy-Lussac's method.

The Oroville Bridge.

Butte county has just completed a contract with the Pacific Bridge Company, of Oakland, to put a bridge over Feather river at Oroville. It consists of two main spans, one of 178 feet and the other of two hundred and twenty-eight feet. This last will probably be the longest span yet built on the coast. It is to be constructed throughout on the Smith Patent Truss Plan, which we illustrated and described in full in a previous number of the Press, and which is rapidly coming into favor. The truss is twenty-one feet high and twenty-two feet wide, with double roadways.

The piers are constructed of cast iron, on Smith's improved plan. Cylinders, 4 feet 6 inches in diameter, are sunk to bed rock and filled with concrete. These are braced, so that the two forming a pier act perfectly together. For rapid currents this plan of pier will undoubtedly become very popular, and it is quite as durable in most places as stone. The whole superstructure is placed over forty feet above low water, and is covered and painted. The contract price is \$18,000. We congratulate Oroville and Butte county generally on this much needed and valuable improvement.

We can also congratulate the coast on the introduction of this new manufacture. The bridge contains very many excellent advantages to which we have before alluded, and the managers of the company evince the most praiseworthy spirit in the manner in which they are going to work. We predict that they will meet with the success which they deserve.

DEPOSITS OF WOLFRAM occur, says the *Deutsche Industrie-Zeitung*, in Chili, Connecticut, Cornwall, Siberia, France, the Hartz and Saxony. (The mineral occurs also in Cumberland, England, and in Missouri and Maine, also in the Hebrides.) One of the richest localities is Zinnwald, Saxony, where occurs a combination of tungstate of iron and manganese, together with scheelite. The first named ore is particularly pure and valuable for iron and steel manufacture.

DYNAMITE-EXPLOSION.—In May, the dynamite factory of Nobel, at Krümmel, Lauenburg, was blown up, and the chemist and four workmen killed.

THE ZINC PRODUCTION of the United States in 1860, was valued at \$10,800. Up to the end of June, 1870, Missouri alone had produced zinc to the value of \$102,000. *B. u. Zeitung.*

A Printers' Cemetery.

There is a newspaper proprietor in Philadelphia, who has won a wide-spread reputation for the interest he shows in his employes. Having himself gained a fortune, he has not thereby lost his love of his fellow-men, nor has success hardened his heart against those to whom such success has not yet come. Recognizing the truth of the principle that the employer is under many obligations to the employed, that no blessing in life is unattended with corresponding responsibilities, he gives encouragement to every honest worker and cares especially for those who toil for him. He provides for the comfort and health of his workmen during their life, secures an insurance on their lives for the benefit of their families when they die, and finally has furnished a proper resting place for their bodies, when their toils and struggles on this earth have ceased forever.

This newspaper proprietor is Mr. George W. Childs, owner of the *Philadelphia Public Ledger*.

Several years ago, Mr. Childs presented a large and beautiful lot in the Woodlands Cemetery to the Philadelphia Typographical Society, an association of printers chartered in 1831. The lot contains about two thousand superficial feet and is entered through a marble gateway, of massive size and great beauty, which is shown in the accompanying illustration. It was formally dedicated by the society on October 17th, 1861, with fitting ceremonies.

The gift was peculiarly appropriate as coming from the generous donor and as being given to the members of the brotherhood of the art preservative. Surely, if any one deserves a pleasant resting place for the tired body, it is those who diffuse knowledge and render thought imperishable.

BORAX.—A very handsome specimen of refined borax has been on exhibition at the Merchants' Exchange in this city. It is from the deposits of the company owning the Columbus marshes in Nevada, a lot of twenty-five tons having been lately sent here for experimental trial. Mosheimer has had charge of the refining, and claims to have an improved process, by which he can produce a superior article at a small expense. The experiments are said to have resulted so successfully that the company are taking measures for working their borax on a large scale.

California Improved Farm Wagon.

Until within a few years, in consequence of the great expense of importing in their bulky form ready-made wagons, and of the length of time necessarily consumed in the voyage here by water, the California mechanics held almost a monopoly in supplying the farmers and others on this coast with vehicles of all kinds and especially with farm wagons.

The importers of the raw materials, lumber and iron, used in the manufacture of these vehicles also had a good and profitable trade at almost their own prices. The importation by rail, only a few days from the shops, of wagons made at South Bend, Chicago and other Western cities, took our mechanics by surprise, and has very materially cut off their business and profits; so much so that some of them have become disheartened, and have abandoned the legitimate manufacturing business, and accepted agencies for the sale of imported wagons, using their own shops for setting up and preparing for sale wagons made in Indiana, Illinois, and other Western States, thus giving employment to capital and labor of those States in preference to our own.

At first sight it would seem as though

our California manufacturers would generally be driven to adopt the same course, or to seek other sources of business for a livelihood. The manufacturers east of the Rocky Mountains, many of them, made large fortunes in supplying the Government and other extraordinary demands during the war, and are consequently in condition to take all advantages of the market in purchasing the raw materials. They have extensive and well-organized shops and machinery, and can, by a judicious division of labor, use that machinery and labor to the very best advantage. They are in the immediate vicinity of an almost unlimited supply of hard timber, and but a short distance from the iron factories, so that all their purchases can be made from first hands and at the lowest figures and on the very best terms as to time, etc.

The capital employed in their business is worth but six or seven per cent. per annum, and their business is so managed that interest on so much of that capital as is invested in stock or raw materials does not count against them until it is nearly ready to be turned again into cash, by the sale of the manufactured articles.

in supplying the demand for the entire coast.

We have the figures to sustain this belief, but will refrain from presenting them this week. We can give, however, one example at least of successful farm wagon manufacture on this coast.

Mr. E. Soule, of Sacramento, a thorough mechanic, an intelligent man and self-sacrificing Californian, seeing the danger to this branch of California manufactures, in consequence of the importation and sale of the trans-mountain wagons, resolved finally to stand his ground and do what he could, single-handed, if need be, to maintain the manufacturing reputation and interests of this State. He counseled with the importers of iron and hard lumber and paints, and oil, and by his representation obtained large concessions from their former prices and time restrictions; he talked with leading merchants and business men and interested them in his enterprise and enlisted their interest in his favor, or in favor of his plans.

Being thus sustained and encouraged he went into his shop in August last, and with four good and trusty mechanics commenced

ENTRANCE TO THE PRINTERS' CEMETERY NEAR PHILADELPHIA.

On the other hand, our manufacturers of wagons are generally men of limited means and have heretofore been compelled to buy their lumber and iron of the importers on this coast, and pay them a good round profit, and settle their bills at the end of each thirty days, so that the importers have made the money out of this trade, and not the manufacturers.

Their shops are generally small, the business being very much cut up between a great number; and so ill supplied with tools and machinery and facilities, that it is impossible to economize the means in their hands to good advantage.

The capital employed in their business is worth here, from twelve to fifteen per cent per annum, and many of them are compelled to pay one and a quarter per cent. per month, and that compounded monthly for a large share of the money actually employed in their business.

These are some of the strongest considerations in favor of the importer and against the home manufacturers and it must be admitted that, at first thought they seem to be insurmountable. Yet we believe, and we are glad to find that many of our most careful, intelligent and prosperous mechanics fully coincide with us in this belief, that all these advantages can be overcome and California may, at no distant day, successfully compete with her most prosperous manufacturing sisters east of the Rocky Mountains, and not only supply her own people with all the farm wagons and other vehicles, but to do her full share

manufacturing.

He exhibited his wagons at the State Fair for 1870, and received for them the first premium. He also exhibited an improvement of his own, on the thimble skein, and was awarded the first premium on that also. He has succeeded in getting up a wagon in all respects particularly adapted to the wants of California. He uses none but the very best Eastern second-growth timber and best quality of iron, and employs none but the best mechanics about his shop. He is now, we are glad to say, making a fair profit on the business. He is now working eighteen men and if he had shop facilities, the orders for wagons being received by him would warrant the constant employment of forty.

THE ACADEMY OF SCIENCES held its regular meeting on Monday. A number of specimens were presented to the cabinet. Dr. Ayres stated that while on a visit to Napa, recently, he was shown a trout captured in Clear Lake, which was 31½ inches in length. He says that trout had not been found in Clear Lake until within a few years. Dr. Blake called attention to the condition of the atmosphere during the past few days. The barometer had been lower than at any previous period during the winter. A southerly wind had prevailed for an unusual length of time. Mr. Hanks gave an interesting description of the Owens' river country. An Ecuador mummy of a female child was presented for inspection. The next meeting will be held May 1st.

The Willard Furnace.

The *Colorado Register*, of April 12th, gives a description of the Willard furnaces, now in operation at Jamestown, which we condense. The fuel is naphtha gas, thus prepared:—Outside the building and standing clear from it, are two large boiler-iron cylinders, made air-tight, and used as reservoirs for the naphtha. From these the oil is pumped, whenever needed, into a smaller iron cylinder placed within the mill, containing a worm or coil of pipe through which steam is passed. As naphtha is volatile at a comparatively low temperature, the heat of the steam is sufficient to produce a gas, which passes from the top of this cylinder into a second. This serves as a gasometer, from which the gas is fed to the furnaces through ordinary gas pipe. This is all of the operation visible, and appears to be attended with but little cost. The furnaces proper are circular stacks, about ten feet high and lined with fire-brick. They rest upon a pit also of brick, which receives the roasted ore, and their flues, to which a blower is connected, pass through a condenser to the main stack. On top of each furnace are two tuyeres—hollow cylindrical iron rings, six inches wide, and about the same height, with twelve inches inside diameter, placed one above the other, into one of which is introduced gas, and into the other ordinary steam. At

the top of the inner circumference of the lower ring, and at the bottom of the upper one, are slits extending clear around the circle through which the gas and steam are admitted to the furnace. The gas is lighted at its point of issue from the tuyere, and is drawn downward by the draft of the blower, forming a cylindrical flame. It will be seen that the gas and steam are admitted at points so nearly identical that a perfect mixing must result. When the furnace is to be used, the gas is first lighted, burning with a brilliant yellow flame. After a little, the steam is let on, and so mixes or re-acts upon the gas flame as to produce a deep blue flame, as if sufficient oxygen for complete combustion was not present. The ore drops into the stack from a screen-feeder placed above the tuyeres. And here is seen a marked difference from any of the ordinary methods of roasting. For the ore that we saw treated was heavily sulphuretted, but instead of exhibiting brilliant rainbow colors when dropping in the flame, as is the case in an oxidizing roasting, the particles flashed up for a moment with an intense yellow color. The roasted ore has every appearance of being well done, and is of a bright red color. The inference might be that the superheated steam decomposes in the gas flame, furnishing hydrogen for a desulphurizing agent, but for the fact that no smell of sulphuretted hydrogen can be perceived, sulphurous acid gas instead, being one of the chief products of combustion. However, we have not sufficiently investigated the re-actions in this roasting, to be able to explain them satisfactorily, even to ourselves. But this much we can say of what we actually saw. A cold furnace was heated sufficiently for work in less than five minutes, and ore was passed through it very rapidly; we should judge at the rate of over 1,000 pounds an hour. We saw some of the roasted ore panned, giving a result that surprised us, for we were not prepared to see the gold so bright, nor the ore apparently so well roasted. Still the assayer, not the sight-seer, is the only correct judge of results. Carefully averaged assays of the raw ore, and of the tailings, as well as of the resultant bullion, can alone prove the value of this or any other process. To us, as lookers-on, it certainly seemed economical and very promising.

THE COCO PINO, a new fire-kindler, recently patented by Mr. J. W. Still, through the Scientific Press Patent Agency, has been tested at this office, and found to answer excellently well the claims made for it. Clean and compact, cheap, kindling into a quick flame the most obstinate fuel, it is an article which will be sought for eagerly. It is in one respect worthy of being called one of the reformers of the day, not only for its effect on the fuel, but also for its influence on the maker of fires, who can now find no excuse for hasty language at dilatory flames. We therefore recommend it all the more cheerfully. It is extensively manufactured by Messrs. Pancoast & Co., and can be obtained of all wood, coal and grocery dealers.

DOMESTIC ECONOMY.

Eating Raw Meat.

There exists a striking partiality in some countries for eating raw food. Raw fish, thinly sliced, forms a delicacy in a Chinese banquet. The Kaffirs eat alternately a slice of raw beef and one cooked. There is a peculiar variety of the salmon, which the Russians—especially in the extreme north—consider delicious, when eaten raw.

As a general thing cold tends to favor an appetite for raw food. Frozen meat is not particularly unpalatable to any appetite, especially if tasted in freezing weather and in the open air.

Most people, who have labored in the open air, in the woods or on the ice, in our extreme northern States, can testify to the delicious taste of a piece of thin, frozen, raw, fat pork on a slice of bread, for lunch. We have enjoyed it with much relish, and never knew a person who did not, when invited to eat it under similar circumstances.

Capt. Hall's testimony is given as follows:—"My opinion is that the Esquimaux practice of eating their food raw is a good one; at least for the better preservation of their health."

Eating meats raw or cooked is quite a matter of education, as we see in every day life, in our own midst. Many, if not most people, even in the mild climate of California, prefer their roast beef or steak so rare done that the blood follows the knife—that is, *raw*. A little "smell" of cooking upon the outside suffices; and that is generally left for those who like their meats "well done."

As a matter of health, there is no doubt but that *very* rare meats are preferable; they are more easily digested, and the nourishing juices of the meat are in the best condition to build up the system. A very little *dry* cooking destroys their nourishing properties. They are also greatly injured by a rapid boiling. Another article in this department, on the subject of boiling meats, is worth considering. Meats when cooked in the "pot" should be boiled very slowly, and a long time—they should be gradually "digested" in a very small quantity of water, and the residual liquid eaten with the meat.

The Pot on the Fire.

There is one mode of preparing food in general use in many parts of Europe which we should do very well more generally to adopt; that is, "gentle simmering." In every or almost every French household there is the *pot au feu*. This permanent "pot on the fire," after the manner of the old-fashioned "digester," occupies a quiet little corner of the stove or fireplace. It can hardly be said to boil, but it simmers on gently, very gently, for hours. There it is the receptacle of many a little bone, whether the trimmings of poultry or butcher's meat. It matters not, every little stray fragment of wholesome meat finds its way there. A bit of liver is considered a great improvement; and any vegetables that happen to be about add to its pleasant flavor, whether the tops of celery, Jerusalem artichokes—which, par excellence, make it delicious—or otherwise carrots, turnips, leeks, etc. But supposing it were to be made altogether of fresh materials—which, indeed, in France it rarely is—this would be the proper recipe: Put a gallon of water into a pot; put into this either three or four pounds of shin of beef, or any similar thing. Add to this an onion or two, or some leeks, carrots or some other vegetable, three or four teaspoonful of salt, one of black pepper, three cloves. Give it one boil up; skim carefully. Now cover the pot closely, and let it cook gently, for four hours at the least. About every hour throw a wineglassful of cold water into it, to make it clear. Taste: it may require a little more salt or pepper, according to taste. Pour this soup over toasted crusts of bread. Both soup and meat will be found delicious. The whole secret of this lies in the gentle simmering in a covered vessel, whereby the flavor is wholly preserved, and nothing is lost.

The Philosophy of Eating.

The young eat for three reasons: 1st, to grow; 2d, to keep warm; 3d, to repair waste. Hence, all food contains one of two elements, and some kinds both, called nitrogen and carbon. The nitrogen makes flesh, sometimes called muscle, and is the same as lean meat. Carbon makes fat, and is that which keeps us warm. Sugar, starch, arrowroot, oil, butter, suet and lard have no nitrogen; there is nothing in them to make flesh out of; all the nutriment they afford is carbon, the material for warmth.

Infants and young children would get so chilly as to freeze, as it were, unless they had something sweet in their food; hence nature has implanted in them an unappeasable taste for sweet things. The thing the newborn infant needs first and always is warmth. Butter, oils and starches abound also in the heat-producing elements, but require strong powers of digestion, are applicable to grown-up persons and to the old; hence, as we grow old, we like fat meats and butter more.

It is in obedience to these laws that the Almighty beneficence and wisdom has imparted a relish for the oils and fat meats in winter, because extra heat is needed. Greenlanders, whose country is always covered with ice and snow, consider butter and lard, and tallow candles, and the rankiest oils the greatest luxuries conceivable. But rice, on which many in warm countries chiefly live, is said to contain scarce one per cent. of the fat or heat-producing element, while oils have ninety-six per cent. of it.

All know how buckwheat cakes are relished in winter; but as spring comes on we begin to lose our appetites for them. The cakes themselves contain fifty-four per cent. of fat as heat producing elements, and they are made more palatable by spreading butter on them, and molasses, each being almost entirely (ninety-six per cent.) heat-producing.

But out-door workers eat meat and bread the year round, and never weary of it, because twenty-two per cent. of such food is flesh forming, and gives that much power and strength to work.—*Hall's Journal of Health.*

INSECT APPETITE.—The man who wished he had a throat a mile long, and a palate all the way, might envy the feats performed in the world of insignificance. Some insects are endowed with an appetite so keen, and a digestion so rapid, that they eat incessantly throughout the whole of their lives. They begin as soon as they are born, and go steadily on till they die. Their existence is a feast, without a change of plates, or a pause between the courses. Morning, noon and night, their mouths are full, and an endless procession of favorite food gratifies the unwearied palate. They know not the names of meals. Breakfast commences with infancy, and their only after-dinner nap is a passage to another state of existence.

UTILIZING SUBSTANCES FOR FOOD.—The siege of Paris will have resulted in at least one good thing, viz., the turning scientific attention towards the utilization of substances for food. We learn that Prof. M. Decaisne has brought forward a plan for the rapid forcing of cabbages, radishes, and other vegetables, which are to be sown in highly manured land, kept for a fortnight, and used stem and root. Bones, too, are much more utilized than before, by the extraction of the osseine by the action of acid, and this is made up in various palatable and nutritious substitutes for butter and jelly.

GALL-SOAP.—Gall-soap, for the washing of fine silken cloths and ribbons, is prepared in the following manner: In a vessel of copper one pound of cocoa-nut oil is heated to 60° Fahr., whereupon half a pound of caustic soda is added with constant stirring. In another vessel, half a pound of white Venetian turpentine is heated, and when quite hot, stirred into the copper kettle. This kettle is then covered and left for four hours, being gently heated, after which the fire is increased until the contents are perfectly clear, whereupon one pound of ox-gall is added. After this enough good, perfectly dry castile soap is stirred into the mixture to cause the whole to yield but little under the pressure of the fingers; for which purpose, from one to two pounds of soap are required for the above quantity. After cooling, the soap is cut into pieces. It is excellent, and will not injure the finest colors.—*Builder.*

A PROCESS has been invented by which castor oil is made palatable, and can be eaten on bread like so much honey.

Domestic Receipts.

DOUGHNUTS.—Boil one quart of new milk and melt in it half a pound of butter. Beat three eggs with two pounds of sugar, then pour on the boiling milk, stirring all the time. When nearly cold stir in a tea-cup of yeast, a teaspoonful of salt, and flour enough to make a stiff batter. When quite light knead in flour enough to make a soft dough. Add a grated nutmeg and a little mace. Let it rise again until very light, roll it out, cut in strips or according to fancy, and fry in hot lard.

CREAM PIE.—Boil three-fourths of a cup of butter in one half pint of water; while boiling, stir in one and three fourths cups of flour. Take from the fire, and stir five unbeaten eggs slowly in with half a teaspoonful of dry soda. Drop on buttered pans, half the size you want when done, split and fill with the following mixture:

Boil one pint of milk, and while boiling, stir in three well-beaten eggs, one cup of sugar, and one-fourth cup of flour. Flavor when cold.

WINE SAUCE.—One and a half cups sugar, half cup butter, beaten well together; then add a glass of wine, two tablespoonfuls of flour, wet with cold water, and let it stand for a few minutes on the stove, then pour it in the butter and sugar and beat it up; grate some nutmeg in it and serve hot.

SPICE CAKES.—Four eggs, one cup of sugar, one cup of molasses, one of butter-milk, half cup butter, one teaspoonful of soda, one table-spoonful of cloves, one table-spoonful of cinnamon, two cups of currants, one nutmeg, mix not very stiff.

FRIED POTATOES.—Pare them, then slice them with a potato or cabbage cutter. Soak the slices all night in very cold water. In the morning dry them in a towel then fry in boiling lard, only cooking a few at a time. Five minutes will cook them if the fat is as hot as it should be.

PORK CAKE.—One cup of chopped pork, one cup of raisins, one cup molasses, one cup milk, four cups flour, one teaspoonful each of salt and soda. Spice to taste.

CIDER CAKE.—Two pounds flour, one pound butter, one and one-fourth pound sugar, one pound fruit, five eggs, two teaspoons soda, four teaspoons different spices, one pint cider.

Mechanical Hints.

TO DISSOLVE SHELLAC QUICKLY.—White shellac may be readily dissolved in the following manner: Put the shellac with some naphtha, or spirits of wine into a wide-mouthed bottle, and fix the bottle in a lathe. By keeping it continually but slowly revolving it will dissolve in about six hours. White shellac mixed with brown, makes a liquid glue impervious to moisture while the former alone makes a good cement for mending glass or porcelain.

BLACK-LEAD PENCIL DRAWING, OR CHARCOAL DRAWINGS, may be fixed by a process which involves but little expense or trouble. Thus: Prepare a solution in moderate strength of bleached shellac in alcohol; wash over the back of the sheet of paper with this, and the drawing on the front will become fixed. In this way, as will be understood, there is no risk of smearing the lines of the drawing.

TO IMITATE BLACK WALNUT.—The appearance of walnut may be given to white woods, by painting or sponging them with a concentrated warm solution of permanganate of potassa. The effect is different on different kinds of timber, some becoming stained very rapidly, others requiring more time for the result. The permanganate is decomposed by the woody fibre; brown peroxyde of manganese is precipitated, which is afterwards removed by washing them with water. The wood, when dry, may be varnished, and will be found to resemble very closely the naturally dark woods.

GILDING ON SLATE.—Use equal parts of glaire and water; when dry, rub with whitening, and be sure that it is dry; put your figures on with gold size and a little chrome or vermilion just for a tint, to see where you are going. When dry enough, apply the gold leaf; all colors should be put upon slate dead, and varnish afterwards or polished.

One way to do it is by using a camel-hair pencil and gold size to trace the pattern or design, and allowed to dry until it becomes "tacky" to the touch, when the gold leaf is gently pressed on, and then carefully and lightly rubbed over with a piece of wool or wash-leather to remove superfluous gold.

LIFE THOUGHTS.

INDIGESTION and industry are two things seldom found united.

AN earnest man with love of children is rarely a bad teacher.

Good deeds are trophies erected in the hearts of men.

A JUST man ought to be esteemed in preference to a relation.

MANY a man dreads throwing away his life at once, who ehinks not from throwing it away piecemeal.

DESPISE not little temptations; rightly met they have often nerved the character for some fiery trial.

I WOULD give nothing for that man's religion whose very dog and cat are not the better for it, says an eminent writer.

A WISE man is not governed by the laws and ordinances of men, but is governed by the rules of virtue.

By temperance men become the most excellent, most happy, and fittest for discourse.

He learns much who studies other men, he also learns more who studies himself.

LOSS AND UNJUST GAIN.—Prefer loss before unjust gain; for that brings grief but once, —this forever.

SAID St. Simon: "If I consider myself I feel dejected; if I consider my fellow-men I feel proud."

YOUNG people should reverence their parents at home, treat strangers with courtesy when abroad, and respect themselves when alone.

A MAN that hoards riches and enjoys them not, is like an ass that carries gold and eats thistles.

He who buys too many superfluities may be obliged to sell his necessities. A fool generally loses his estate before he finds his folly.

TOWERS are measured by their shadows, and great men by their calumniators. That man who knows the world will never be bashful, and that man who knows himself will never be impudent.

Things Worth Forgetting.

How much wiser we would be if we could remember all the things worth remembering that occur day by day all around us. And how much better we should be if we could forget all that is worth forgetting. It is almost frightful and altogether humiliating to think how much there is in the common on-going of domestic and social life which deserves nothing but to be instantly and forever forgotten. Yet it is equally amazing how large a class who have no other business but to repeat and perpetuate these very things. That is the vocation of gossips—an order of society that perpetrates more mischief than all the combined plagues of Egypt put together. Blessed is that man or woman who can let drop all the burs and thistles, instead of picking them up and fastening them on to the passenger. Would we let the vexing and malicious sayings die, how fast the lacerated and scandal-ridden world would get healed and tranquilized. Forget the gossipings and bickerings, the backings and sneaking innuendoes and remember only the little gleam of sunshine and poetry that can illuminate the humblest life, if we only drive away and forget the clouds engendered by things that should never be remembered.

If you are a wise man, you may treat the world as the moon treats it—show only one side of yourself; seldom show yourself too much at a time, and let what you show be calm, cool and polished; but look at every side of the world.

THE line of conduct chosen by a young man, during the five years from fifteen to twenty, will, in almost every instance, determine his character for life. As he is then careful or careless, prudent or imprudent, industrious, or indolent, truthful or dissimulating, intelligent or ignorant temperate or dissolute, so will he be in after years; and it needs no prophet to cast his horoscope or calculate his chances in life.

"WHEN a stranger treats me with want of proper respect," said a philosophic poor man, "I comfort myself with the reflection that it is not myself he slights, but my old shabby coat and hat, which, to say the truth, have no particular claims to admiration. So if my hat and coat chooses to fret about it, let them; it is nothing to me."

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Scientific and Practical
BOOKS
—ON—
MINING, METALLURGY, ETC.
BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.
Published and Sold by
DEWEY & CO.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.
As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.
Price, \$5 in cloth; \$6 in leather—coin.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.
This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.
It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price \$2.50 coin, or \$3 currency, postage free.
For single copies of the above works, or for the trade, address
DEWEY & CO.,
Publishers and Patent Agents, Scientific Press Office
San Francisco.

7-30 GOLD LOAN
OF THE
Northern Pacific Railroad.
RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 560.
A GOOD INVESTMENT. We are now selling, and unhesitatingly recommend, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 per cent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on
23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.
LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Rail road security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.
SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their simple security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.
EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 6 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.
OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES on Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. Agencies for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.
For Sale by

WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully presents:
That no fact in the history of manufactures is more completely demonstrated than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been simple and satisfactory. It is admitted on every hand—the evidence of daily observation and common reputation—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their sizes, shapes and appearance should suit the tastes of the people. As to all these conditions the American Watch Co. are now fully prepared to answer the exactions of the market. They confidently assert there is no longer any need for such variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the Latest Improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered,

No such Watch, in Quality and Beauty,

Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,

The Company Challenges all Manufacturers of all Countries

To beat or equal for its price. It is made with all the latest improvements in every part—improvements which IMPROVE—and which not only make it better for its purpose as a timekeeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devote the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.

For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

ROBBINS & APPLETON,

General Agents for American Watch Company, 182 Broadway, New York.

Substantial Success Based on Merit.

THE

IRON WORLD AND MANUFACTURER

IS PUBLISHED WEEKLY AT

Pittsburgh, Pa.,

AND IS THE LEADING—IF NOT THE ONLY—REPRESENTATIVE JOURNAL OF THE METAL TRADES PUBLISHED IN THE UNITED STATES.

Located in the very centre of the metal interests of the United States, with offices and correspondents at the leading cities in the East, West and South, we do not err in claiming that it is the REPRESENTATIVE JOURNAL of the Metal Manufacturers, Workers and Dealers of this country.
THE IRON WORLD AND MANUFACTURER has a large and extended circulation throughout the United States, and is taken by Iron and Steel Manufacturers, Machinists, Founders, Hardware Dealers and Tanners, Gunsmiths, Plumbers, Cutlery Manufacturers, File Manufacturers, Saw Manufacturers, Boiler Manufacturers, and by

Leading Railway Officials.

It advocates protection to American Manufacturers. Its markets are full and reliable. If you are a manufacturer, take the journal that advocates your interests. Don't patronize Free Trade journals, but help those who help you.

With Free Trade the manufacturers of this country would be ruined. English gold is scattered with a liberal hand to further Free Trade. Expend some of yours to favor Protection.

If you advertise, which is the best medium? Circulation being equal, which would you patronize—a Free Trade journal or a Protection journal? Circulation is considered the value of an advertising medium. Much depends on the character of the circulation. The New York Weekly Tribune claims 200,000 circulation, and gets from two to five dollars per line for advertising. The Iron World reaches more people engaged in the metal business than the New York Tribune. Our rates are about ten cents per line. Which will pay the best? Sample copies mailed Free. Address

IRON WORLD PUBLISHING CO.,

10v144STEAM JET PUMP.
Blakelock & Williams' Patent.—For
Water, Oils, Acids, Etc.The best cold water
pump for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.
We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.Satisfaction guaranteed or the money refunded.

RATT, Cor.
Mission &
Fremont
streets, San
Francisco.DESCRIPTION.—D, is a glass chamber which contains
the lubricant. O is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F, is the discharge
pipe for the lubricant, provided with an inverted syphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E, a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the election
of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and C. 10v18-4f

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee
that the purchasers shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains,
from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and
repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

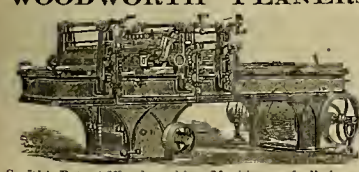

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its
merits. One can always be seen at the Pacific Iron
Works.

Ten of these Mills are now in operation.
For further particulars address

FURMAN R. WILSON,
San Francisco.

WOODWORTH PLANERS

Smith's Patent Wood-working Machinery of all descrip-
tions. Sole Agents,
BERRY & PLACE,
112 and 114 California street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces. —
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

CARLES R. DONNER'S PATENT

IMPROVEMENT IN

HUBS AND AXLES

This new patent is for an improved manner of uniting
the steel spindle, I, with the iron portion of the axle, J,
with the double collar, K, and also in the formation of
a sort of hub on the holding-nut, F, which hub can be
shortened so as to bring the nut closer, and thus com-
pensate for any end wear of the box; also in the use of
secondary steel boxes, A, within the main axle-box, B,
and a series of oil-cups, C, arranged on the hub and an
outer nut, which opens at various points within the
box. A cap and protecting-ring are secured at the outer
and inner ends of the hub, respectively, to protect from
dirt.

An operative model and full description are necessary
to show fully all the merits of the invention. The pa-
tente can prove the value of the invention from actual
working; that it is an easy mode of construction and
furnishes a durable and more complete hub and axle
than any other that has yet been devised.

The attention of Manufacturers is solicited. All per-
sons are cautioned not to infringe on the above patent
under penalty of the law.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.

A circular containing a full description of this Powder
can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE
Ransom Patents, the most perfect SANDSTONE, speci-
mens of which may be seen in the ornamentation of
Dr. Stone's Church, now in course of erection, at the
corner of Post and Mason streets. For architectural,
ornamental and mechanical purposes, this stone sur-
passes all natural stone of its class.

SANDSTONES from this factory, which we make of
any desired size, may be seen at many of the great
mechanical shops in this city, where they are held in
high esteem.

The factory is now turning out Architectural Stone,
Cemetery Stone, Grindstones, Garden Ornaments, in
the way of Vases, Fontains, etc. The nature of the
art admits of our moulding the stone in any desirable
form, and enables us to compete successfully with all
natural stone wrought by hand. In England, where the
stone has been manufactured largely for the past fifteen
years, it is considered, for durability and strength, to
surpass the best English Sandstone. The British
Government employs it largely in its public buildings,
both at home and in its Colonies, and as we have se-
cured the services of MR. ERNEST L. RANSOM, late
Superintendent of the home works at Greenwich, Eng-
land, we are turning out stone fully equal to the English
standard.

For particulars, apply at the Factory, corner Turk and
Larkin streets. ma18-4f

A NEW ARTICLE.

Composition Pipe for Conducting Water.

The attention of Railroad Companies, farmers dairy-
men and others, is called to our new Pipe for leading
water. It is lighter than ordinary lead pipe, and much
cheaper than iron. It will stand a heavy pressure, and
deliver about one third more water than iron pipe, pro-
vided the sizes are the same.

We are now manufacturing all sizes, from half-inch to
two-inch, and can fill large orders at short notice and
put on reels for shipment, the same as lead pipe.

Samples can be seen at our office.

No. 116 California Street,

way, New York. ma25-4f

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY
GIVEN, that BETTS'S NAME is ON EVERY CAPSULE
he makes for the principal merchants in England and
France, thus enabling vendor, purchaser, and consumer,
not only to identify the genuineness of the Capsule, but
likewise the contents of the vessel to which it is applied.

The Lord Chancellor, in his judgment, said that the Cap-
sules are not used merely for the purpose of the ornament,
but that they are serviceable in protecting the wine from
injury, and insuring its genuineness.

DEWEY & CO.,
American and Foreign Patent
Agents, Publishers of
the Scientific Press,
San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

Models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, APRIL 29, 1871.

VOLUME XXII.
Number 17.

Combined Roasting and Smelting Furnace.

The peculiar conditions of metallurgy in our country, where, with what would anywhere else be considered enormously rich ores, there yet exist high prices of labor, freight, fuel and of everything, in short, connected therewith, are calling into play the inventive talent of our mining community and are bringing out the most varied devices.

Among those who have set to work in this matter, Messrs. Gerrish and Hinkle,

Fig. C, an end view; and Fig. A, a horizontal section (of a part of) their furnace.

The ore is carried by a screw-conveyor, *p*, from the battery to the furnace, and by an elevator, *o*, to the top of the shaft. Here it falls into a hopper and is fed into the shaft by a peculiar device which we have previously mentioned. This shaft (a cast-iron shell lined with fire-proof material) has two fire-places, *l l*, (similarly constructed), and a short partition, *t*, the last to regulate the falling of the ore. In descending the shaft, the ore is to be roasted, any particles which here partially escape

the Press.

An auxiliary chamber, *c*, may be added. Should it be desired simply to roast, as for amalgamation, the bottom of the shaft, *s*, may be closed in the manner denoted in Fig. C, and the ore allowed to fall into this chamber, whence it can be carried off in iron cars, as shown in the cut. The opening, *q*, into this chamber is hricked up when smelting is being performed. Again, if the ore does not require roasting, it can be fed directly into the smelting shaft from *n*.

The fumes, etc., pass through *f* into the

success. They are protected by a caveat, obtained through the SCIENTIFIC PRESS Patent Agency. Their names are G. M. Gerrish and Philip Hinkle; their address, Geo. Hearst & Co., 14 Hayward's Building. Mr. G. M. Gerrish may also be addressed at Salt Lake City, where he is engaged in preparations for erecting furnaces.

MAYOR POWELL, the Colorado explorer, has started on his second journey. He goes under the auspices of the Smithsonian Institute, there being an appropriate

THE GERRISH & HINKLE PATENT COMBINED ROASTING AND SMELTING FURNACE.

of this city, evince the greatest determination to solve the problems offered in our metallurgy. We have already described and illustrated several of their inventions. We now give another which, though similar in some respects to previous devices of theirs, has several novel points of importance.

The accompanying illustration needs but little description to make it clear. The plan is the result of studies to shorten the time and expense of extracting the precious metal from the ores. The inventors have boldly determined to perform the roasting and smelting in one operation. Fig. B shows a side view (and partial section);

the roasting action and are carried out by the draft, being thoroughly treated in the flue, *j*, by means of the auxiliary fire-place, *k*. The ore falls from the roasting shaft, *s*, (the one just spoken of) into the smelting shaft, *h*, the requisite materials for effecting the smelting being automatically introduced from *n*. The smelting shaft is built independently, in order to facilitate repairs, etc., and the roasting shaft and connecting parts are supported on plates, arches, or by similar means, resting on the pillars, *b*. The tapers are denoted by *e*, the metal pot by *g*, and the slag opening by *f*. If desired, the blast may be heated, at *d*, as described in a previous number of

shaft, *z*, through which falls a spray of water, condensing the condensable matter and aiding and regulating the draft. The reservoir below this shaft is denoted by *x*; the flue to the chimney by *w*; and a slide for still further regulation of the draft by *y*.

It will be seen that doors are provided at several places in order to get at and clean the various parts of the furnace, watch the process, etc. It will be seen, also, that no manual handling of the ore is required from the time it goes to the battery until it has passed through the smelting shaft. The plan is bold and novel, but the inventors feel confident of having effected a great

tion of \$20,000 for the expedition. The party are well supplied with instruments, hooks, and all that is necessary for a complete and accurate survey and exploration. They intend making a stay of two years.

THE HYDE STEAM WAGON.—The new steam wagon invented by Oliver Hyde of this city, this week hauled the huge capitol columns, each weighing 13 tons, from the Miners' Foundry to the Second street ferry landing.

THOMPSON ROAD STEAMER.—A correspondent of the *Ely Record*, writing under date of April 14th, says that a Thompson Road Steamer will be ready in 60 days for use between Toano and Pioche,

MECHANICAL PROGRESS.

A POWERFUL PUMP.—At the Glen Carbon Colliery, near Pottsville, Pa., is a pump of recent invention, which is thus described by the *U. S. Railroad Register* of April 8th: "There is a cast-iron pipe eight inches in diameter and three hundred feet long, cast in longitudinal sections and bolted together, each section being six feet in length. In the intervals between these sections are shorter sections, one foot long, constructed in the same manner, with bearings supporting a shaft made of steel, one and three-fourths inches in diameter, extending the entire length of the pipe. Mounted on this shaft, at intervals of three feet, are screw propellers, with two blades seven and a half inches in diameter, with an angular pitch of sixty-five degrees, and revolving with the shaft. Midway between these propellers, and attached to the walls of the pipe, are wings or blades of the same pitch and form as the blades of the propellers, but of a reverse angle. At the lower end of the elevator is a basket or guard of cast-iron to prevent stones, coal or other obstructions from passing into the pipe. The toy of the elevator has a spout or nozzle to direct the stream of water as it passes out, above which is a novel and ingenious contrivance to support the weight of the shaft, with its propellers and the column of water. There is a disc sixteen inches in diameter secured permanently to the top of the pipe, upon which rests a ring of brass twelve inches in diameter, on top of which is another disc fourteen inches, embracing the outer periphery of the brass ring. This upper disc is permanently secured to the propeller shaft. By means of a small donkey-pump water is forced between the two discs under sufficient pressure to slightly separate them, so that the top disc, propeller shaft, and column of water are supported by the film of water between them, and thus the rotation of the propeller shaft revolving on the water causes only a very small amount of friction. The donkey-pump receives the water from a small tank, and any surplus water forced between the discs raises the ring of brass, and is discharged back into the same tank. The propeller shaft is revolved by a wire rope passing around a groove pulley above the upper disc, and driven by a steam engine. * * We found by the indicator that the volume of water passed through was ten thousand and ninety-eight gallons per minute."

A NEW THING IN WEAVING.—The *Bureau* is enthusiastic in the description of a new loom which it says will revolutionize the business of weaving. We quote: "The inventor is a Mr. Abel, of Vermont, and he calls his new machine the *Weft-Thread Loom*. We have studied its construction and operations, and can say to the more than seven hundred woolen manufacturers whom we address by our journal, that it is a most remarkable invention, and has imperative claims upon their attention. One fact alone will demonstrate this. A first-class Crompton loom will weave thirty yards of cloth a day. A machine of the weft-thread pattern of the same class, will produce, of equally good fabric, *three hundred yards daily!* The Abel loom is simple in construction, and can be made of any size required. For cloth of ordinary width, the extreme dimensions are five feet by six, or thereabouts. The movement is easy—a lad of fifteen being able, by a crank attachment, to supply power for several machines. It makes no more noise than a Wheeler & Wilson sewing machine, and runs as easily. Its motion is that of knitting and weaving combined. The yarn is taken direct from the bobbins, which are placed in a semi-circular form, close up to and forming part of the frame of the loom. On these bobbins the yarn is wound with ease and speed, on a machine invented for the purpose by Mr. Abel. There is no dressing, beaming, spooling, or warping; no use for harness, reed, or shuttle. The warp or filling runs in from the same bobbin as the weft-threads, and the product of thirty yards per hour is so firm, strong and stocky, that it is almost impossible to rend it, and it cannot ravel; while in smooth, even surface it is the equal of any cloth we have seen made. To these advantages it adds that of economy in the saving of waste, to the extent of at least fifty per cent. over any other loom in use. Its simplicity of construction will make its repairs easy and of slight cost. With these advantages, the machine weaves also every variety of pattern in plain, fancy, ribbed and striped goods, and uses any material in

silk, cotton, flax or jute as well as of wool. In fact, the range of its production is from the coarse gunny cloth for cotton bales, to the most elegant cloths of our mills, East or West."

NEW WATER METER.—Fred. E. Bodkin, in a paper recently read before the Society of Arts, in London, upon the subject of "Water Meters," thus describes a new invention by Messrs. Cook and Watson:—"It consists of an upper plate, indented on the under side with a ring of thumb holes, and riding loosely in a chamber over a lower plate, through which inclined inlet holes are bored. The water rises through these holes, raises the upper disc, and, acting against the square ends of the thumb holes, causes it to rotate at the same time. This action, of course, requires some small power to commence, but as soon as the upper plate is lifted it must also necessarily rotate. When the supply ceases the upper plate falls, and forms a tight valve against the return of the water; and since, during its period of revolution, this plate floats in a film of incoming water, there are no wearing surfaces involved in the machine. Small stays are placed on the upper surface of the revolving plate, in order to produce regularity of motion under varying pressures, and appear, from the specimens I have at different times been enabled to test, to do so with complete success. These machines are not expensive, and offer but small opposition to the flow of liquid, and certainly appear to be the simplest and most practicable form of high-pressure meter yet invented."

PITTSBURGH MANUFACTURES.—"From a careful compilation of the statistics contained in the forthcoming census report, it is found that the cities of Pittsburgh and Allegheny, with their immediate suburbs, have a total of one thousand five hundred and fifty-seven manufactories of various kinds. Of these, the larger number are engaged in the production of iron or steel work, and in these branches a capital of \$26,692,686 is invested; the annual consumption of raw material amounting to \$14,734,883, and the value of the product being \$36,328,711. These establishments give employment to 15,541 hands. * * The entire manufacturing industries of the two cities represent a total capital of \$53,439,650, employ 33,635 hands, pay \$17,434,566 in wages annually, consume raw materials to the amount of \$35,338,099, and produce annually to the amount of \$78,239,933."—*Iron Age*, April 13th.

THE PERFECTION OF MODERN TOOLS.—"Not fifty years since, it was a matter of the utmost difficulty to set an engine to work, and sometimes of equal difficulty to keep it going. Though fitted by competent workmen, it often would not go at all. Then the foreman of the factory at which it was made was sent for, and he would almost live beside the engine for a month or more; and after easing her here and screwing her up there, putting in a new part and altering an old one, packing the piston and tightening the valves, the machine would at length be got to work. Now, the case is altogether different. The perfection of modern machine tools is such that the utmost possible precision is secured, and the mechanical engineer can calculate on a degree of exactitude that does not admit of a deviation beyond a thousandth part of an inch. When the powerful oscillating engines of the *Warrior* were put on board that ship, the parts, consisting of some 5,000 separate pieces, were brought from the different workshops of the Messrs. Penn & Sons, where they had been made by workmen who knew not the places they were to occupy, and fitted together with such precision that so soon as the steam was raised and let into the cylinders the immense machine began as if to breathe and move like a living creature, stretching its huge arms like a new-born giant, and then, after practicing its strength a little, and proving its soundness in body and limb, it started off with the power of above a thousand horses to try its strength in breasting the billows of the North Sea."—*Smiles on "Iron Workers and Tool Makers."*

CUTTING GLASS BY THE BLOWPIPE FLAME.—At a recent meeting of the Albany Institute, a member exhibited specimens of glass cutting by the use of the blowpipe, which is specially adapted to cutting tubes. The cutting is done by directing the point of the blue flame against the side of the tube. Instantly, a small check or crack is formed, which may then be led in any direction by directing the point of flame to the part to be cut.

SCIENTIFIC PROGRESS.

MORE OF ERICSSON ON SOLAR HEAT.—*Engineering* for March 17th has an article by Capt. E., showing that his calculations in regard to the temperature of the sun, based upon the indications furnished by his solar pyrometer, are corroborated by those based upon the indications furnished by an incandescent spherical radiator: although in the solar pyrometer, the radiator is only at boiling heat. We must omit the demonstration, but we quote a paragraph or two of the article: "Objections have, not unreasonably, been raised against my solar pyrometer on account of the low temperature employed. It is contended that unless the radiator is raised to the temperature of incandescence emitting luminous rays, the radiant heat transmitted to the focus will not furnish a true indication for determining the temperature of distant incandescent bodies. Numerous experiments, however, show that, relatively, there is no appreciable difference between the energy of the dark heat rays emanating from a metallic radiator of low temperature presenting a thoroughly disintegrated, or a blackened surface, and the energy of heat rays accompanied by a light, emanating from an incandescent metallic radiator. The temperature transmitted by the radiant heat to the focus is, in such case, directly proportional to the temperature of the radiant surface. Indeed, an air thermometer placed in the focus of a concave spherical radiator of ice, and surrounded with very cold substances, say 100° below zero, will furnish an indication by which the temperature of distant incandescent bodies may be ascertained with as much certainty as by employing a radiator heated to such a degree as to emit luminous rays. It scarcely needs explanation that my reason for constructing the solar pyrometer with a radiator kept at the low temperatures of boiling water, is that of admitting of operating within a vacuum, besides rendering it possible to measure the temperature with positive exactness. * * It is specially worthy of notice that the result of the experiment with the incandescent radiator corroborates the fact established by the solar pyrometer, that while gravitating energy depends on volume multiplied by density, radiant energy depends on area multiplied by temperature; both obeying the same law in traversing space, viz., diminishing in the inverse ratio of the square of the distances. In view of the foregoing statements and the demonstrations contained in previous articles on the subject of radiant heat, the correctness of our calculations fixing the sun's temperature at not less than 4,060,000° Fahr., cannot be controverted."

CHANGES IN WEIGHT BY OXIDATION AND REDUCTION.—Julius Thomsen shows these by the following lecture experiment: Cupric oxide is mixed with gum-water to a stiff paste and formed into cylinders, flattened on their sides, about a centimeter in diameter and three centimeters long. These are then dried, ignited, and reduced by hydrogen at the lowest temperature possible. A cylinder of metallic copper is thus obtained, very porous but sufficiently coherent to retain its form. These are wound with platinum wire, the two ends of which are melted into glass tubes by which they are handled. Two small tubulated glass bells are filled, the one with hydrogen, mouth downward, the other with oxygen, mouth upward, by displacement, the gases being allowed to flow slowly into them during the experiment. One of the copper cylinders is warmed to expel moisture, and immersed in the oxygen; it is raised at once to ignition and remains so until completely oxidized. It is then plunged into the bell-jar of hydrogen; it again begins to glow, the water formed runs down the side of the bell, and the cylinder is reduced to copper again. These combustions, the one in oxygen, the other in hydrogen, both evolving much light and heat, are very striking; and as the increase in weight of the cylinder by oxidation is almost a gram, it may be shown on an ordinary balance.—*Ber. Berl. Chem. Ges.*

EOZOON ONCE MORE.—Dr. Carpenter makes a final answer to Mr. T. Mellard Reade, in *Nature* for March 16th. We give the concluding paragraph: "Since I do not feel called upon to expend valuable time in giving to Mr. T. Mellard Reade the instruction which he requires to qualify him for discussing this question, I

now leave him to the enjoyment of his own opinion. Whenever he shall have shown, by work of his own, his competence to criticise the observations of others who have made a special study of the subject he discussed, I shall be most happy to afford him the same opportunity of forming his judgment as to the organic nature of Eozoön, by an examination of my preparations, that I have given to the many eminent naturalists, who have thus fully satisfied themselves of the justice of my conclusions."

NUCLEI PROMOTE CRYSTALLIZATION.—The *London Standard* says: "The singular action of nuclei in promoting crystallization has long been known, but recent experiments by Mr. Chandler Roberts, chemist of the Mint, have imparted additional interest to the subject. Minute traces of lead, antimony, bismuth, or arsenic render the alloy of gold and copper known as "standard gold," crystalline, intensely brittle, and totally unfit for the purpose of coining. This remarkable effect is produced even when the amount of obnoxious metal does not exceed the 1-1900 part of the mass of standard gold."

THE REALITY OF SPECIES.—In a communication to *Nature* for March 30th, D. Sharp says that among the many misconceptions that have arisen in connection with the doctrine of evolution, is one that species have no real existence. We quote: "It cannot be too distinctly insisted on that natural selection opposes no barrier whatever to the reception of the idea of distinct and separate species. That which it has destroyed is the notion of the constancy of species if the idea of time be set on one side. To argue that species have at the present day no separate existence because they had formerly a common origin, is a foolish confusion. The separate existence of a full-grown and mature animal is not questioned, because at one time it was a bud closely connected with its parent. In point of fact the question of species is really very similar to that of individuality, viewed as a question of origin, the individual and the species are both untenable ideas; but viewed at any one moment, both individual and species are among the most prominent and undoubted facts of our experience. Equally futile is it to argue that species have no existence, because we cannot exactly define what we mean by a species. It is well known that all the efforts of biologists have hitherto failed to produce a satisfactory definition of life. Are we, then, to conclude there is no such thing as a living animal? The evolutionist contemplates throughout the universe a power underlying all things, indestructible and infinite, most various in its manifestations, always changing and always shifting, but steadily in a given direction, not revealed to man as a separate existence, but known only by its changes and movements, and veiled under the form of matter. Side by side with this universal and unknowable force he sees an opposing power, a tendency in things and matter to be always as they have been, a tendency which the restless force has ever to overcome; but as soon as this has gained its victory, again is it subject to the grasp of its ignoble foe; the struggle, though becoming ever more and more one of detail, is no spasmodic one, though more revealed to us in some phenomena than in others, and more evident at some moments than at others. The questions of the origin, the existence, and the value of species in such a system are easily appreciated."

ORIGIN OF DIAMONDS.—The following is from *The Academy*: "Professor Morris has started a new theory as the source whence diamonds are derived. Hitherto they have been looked upon as coming from igneous and metamorphic rocks, like garnets, rubies, and many other precious stones; a better knowledge of the geology of the diamond district of South Africa, leads us to conclude that these stones come from certain stratified beds containing, besides reptilian remains, numerous plants and much fossil wood. These beds are known as the "Karoo" or *Dicynodon* beds. Professor Morris calls to mind the remarkable fact (well known to botanists and mineralogists) that in the stems of the bamboo small crystals of quartz are found, known by the name of *tabasheer*; he suggests, whether it may not be possible that the diamonds yielded by these old plant beds similarly owe their origin to vegetable growth."

CORRESPONDENCE.

Notes of Travel in Marin County.

[Written for the Press.]

San Rafael, the county seat of this county, is situated on the northwest corner of San Francisco Bay, 14 miles from the city of San Francisco; 10 1/4 miles of this distance is made by steamer (to Point San Quentin), the remaining 3 3/4 miles by railroad. Steamer fare, 50 cents; railroad fare, 25 cents. The town contains about 900 inhabitants, a prominent proportion of which are men of wealth, retired merchants of San Francisco. The valley in which this village is situated is about 10 miles long, and from 2 to 6 miles wide, and is considered the healthiest in the State. Until recently, one physician, Dr. Tolferro, did the entire business of the county, including the State Prison containing an average of over 1,000 convicts all the time; he now has an assistant in the person of Dr. DuBois, but their time is not all taken up, and is occupied principally upon diseases brought there. No fogs prevail here at any time of the year. The temperature for the spring and summer months does not vary over 15°, at any time. This place is accommodated with three hotels, and several fine boarding houses; of the former, the "Sheppard House" is just now undergoing repairs and receiving a complete new furniture outfit. The "Tamalpais Hotel," completed last month, is one of the finest in the State. Of its exact size I am not posted, but it is about 60x80 feet, three stories high, of modern architecture. This house can comfortably accommodate from 75 to 100 persons. The furniture throughout is of heavy black walnut, the entire cost of which (including the dining room, silver and linen), cost upwards of \$20,000. The hotel is lit throughout with "Maxim gas," which gives general satisfaction. Polite and attentive clerks and genial proprietors are in attendance. To those who can afford \$1.50 per meal, it is one of the best places outside of the city to spend their money in.

The points of resort near this place are Tamalpais Mountain, the "red woods," trout fishing (the best found in the State 5 to 12 miles distant), also huckleberries in large quantities, found on the mountains between Tamalpais and Olema. At and near the latter named point exist the finest dairies; at least, the finest hutter and cheese in this State are made here.

U. M. Gordon, Esq., capitalist, is now erecting a fine two-story brick building, 31x58 feet, at a cost of about \$15,000, for the purpose of starting a private bank here, to be in operation by July 1st, this year.

Nelson & Co., and A. McLeod, are the principal carriage manufacturers. The latter employs regularly nine men.

J. B. Rice, Esq., whose office is situated at this place—San Rafael—is manufacturing by contract 2,000,000 bricks annually, and from that upwards. The brickyards are situated some six miles distant. Some 15 men are regularly employed. There are two livery stables here, the most prominent of which the "Bay View" is kept by M. Murray, where the best of teams can be had at the cheapest rates.

A. D. Mailliard, of this place, is the owner of two of the finest stallions in the State, of which I give below a condensed pedigree of each. Young Eclipse is a dark bay horse, nine years old, 16 1/2 hands high, by Imported Eclipse, out of Imported Barbarity, dam of Ruthless, Relentless and Remorseless. He combines the blood of Bay Middleton, Web, Waxy, Camel, Touchstone and Whalebone on both sides. Stallion Monday is a blood bay horse, seven years old, 15 1/2 hands high, by Colton, out of the celebrated mare Mollie Jackson, by Vandal. He won the trial stakes at Jerome Park in 1866. In 1867, he won at Jerome Park, May 23d, a purse of \$700; at Patterson, New Jersey June 4th, the "American Derby" with 33 entries, beating all competitors; 2 days later, the "Sequel Stakes," 2 miles in a canter, showing in all his races great speed and extraordinary bottom. Colton, his sire, was one of the fastest sons of Lexington, out of Topaz, by Glencoe, the dam of Ansterlitz, Waterloo, Wagram, Lodi, Arcola. Mollie Jackson's victory at Woodlawn,

in 5:35 1/4—5:34 1/4—5:28 1/4, with full weights for age, stands yet as the best three mile race ever run in America.

Monday's grand-sire, Vandal, and his grand-dam, Topaz, being son and daughter of Imported Glencoe, unite in him to perfect the blood of that remarkable stallion. He is a perfect beauty.

Wm. T. Coleman, Esq., of your city, has invested at and near this vicinity (in lands alone) some \$200,000. He now possesses about 2,500 acres of land here. I advise all who have not already, to pay San Rafael a visit. L. P. MC.

High Mass in a Mine.

The *Overland Monthly* for May is good, very good. It has its usual number of stories, its descriptive articles concerning our coast, its wit and its wisdom. Its high rank is well sustained and the magazine is, if anything, more readable than ever. We clip the following, rather at random, from "On the Mexican Border."

In order that nothing might be neglected which tended to the good of the people, and the glory of God, High Mass was celebrated by the Bishop and his *cher ami*, in the Corralitos Mine. In this mine, far underground, the *peones* had carved out a large and lofty chamber, which they used as a chapel. Its altar and holy furniture were as showy and expensive as any above-ground, while the effect of the celebration of Mass in it was much greater than in any cathedral. It was the custom of the *peones*, as they entered the mine every morning with their families, each person carrying a lighted candle, to pause a few moments for prayer and singing in the chapel. Accustomed as I became to this daily spectacle, it never lost its charm for me. The singing of hundreds of voices, rolling and reverberating through the chambers of the mine, was echoed again and again from near and far in the most wonderful manner. The spectacle of High Mass in the Corralitos Mine was very impressive, and the singing of six or eight hundred sweet-voiced *peones* worth going a long way to hear.

PUNCH AND JUDY IN EUROPE.—One pleasant summer day, a few years ago, the writer of this article was standing with an officer of the Bavarian army in the Odeon Platz, at Munich, watching the entertaining performance of "Punch and Judy." At the most thrilling moment of the mimic tragedy, a slight movement among the spectators caused us both to look round; and to my amusement, and my military friend's dismay, we encountered the kindly eyes of old King Louis. Noticing the officer's confusion at being caught amusing himself in this rather unfashionable manner, the genial old gentleman pleasantly made him be at ease. "You need not feel ashamed to be seen here, Herr Lieutenant," said he, "I often stop myself to see the performance, and find it very amusing." He remained a few moments, laughing like the rest of the crowd at the droll mimicry of life exhibited in the little playhouse, and then, with a pleasant smile and word, withdrew. The incident was characteristic of the man and the people. While he stood there, no one took more notice of him than if he had been a private gentleman. There was no rude staring to which persons of exalted rank are always subjected by Englishmen and Americans. Every one quietly attended to the play until the King took his leave, when those immediately about him raised their hats with every mark of that esteem and affection which even his unfortunate infatuation for Lola Montez could not eradicate from the hearts of the Bavarian people.

The performance which old King Louis found so amusing, has not been naturalized in this country. It was exhibited for a short time at a popular place of amusement in this city about a year ago, but did not take sufficiently with the audience to induce the manager to go on with it. It was considered silly and stupid; and yet it may be made the medium of the most amusing whimsicalities. In Europe its popularity is unbounded. Even royalty, as just related, unhesitates to enjoy it; and we are told that so grave and dignified a personage as an English Secretary of State is certain to be, once paused on his way from Downing Street to the House of Commons on night of important debate to witness the whole performance.—From "The Story of Punch and Judy," in *Harper's Magazine* for May.

WHAT NEXT?—A "petrified whale" has been discovered in Los Angeles county, about 10 miles inland, near Aliso Springs. Petrified trees are at a discount.

Locomotives for Narrow Gauge Roads.

With the ready adaptation to new conditions, for which Americans are pre-eminent, the Baldwin Locomotive Works, of Philadelphia, have perfected arrangements for manufacturing locomotives for narrow-gauge roads, and have already turned out quite a large number. We have received from the proprietors, M. Baird & Co., photographs of several patterns of their engines, together with dimensions, weights, etc.

The Baldwin works have built and are building engines for roads of 2 ft. 6 in., 2 ft. 9 in., 3 ft., and 3 ft. 6 in. gauge, but find that the 3-foot gauge is the one in most favor. If a system of narrow-gauge roads is to be constructed in the country, it is manifestly important that a uniformity of gauge should be agreed upon. The 3-foot gauge is the one adopted by the Denver and Rio Grande road, besides others at the East.

We copy a few tables which are of interest now that the matter of narrow gauge is attracting so much attention on our coast.

WEIGHTS OF NARROW AND FULL GAUGE CARS.			
	Weight of Empty Cars.	Capacity.	Dead Wt. to Load.
1. 8-wheeled Box Car...	20,000 lbs.	20,000 lbs.	100
2. 4-wheeled Box Car...	4,500	5,000	65 1/2
1. 8-wheeled Flat Car...	35,000	24,000	65 1/2
2. 4-wheeled Flat Car...	3,500	9,000	38 3/4
1. 4-wheeled Coal Car...	6,000	11,000	60
2. 4-wheeled Coal Car...	4,000	8,500	47

1, Full Gauge; 2, Narrow Gauge.

Comparative Cost of Superstructure.

The following are comparative estimates of the cost of a mile of single track, properly proportioned for each gauge specified.

1st. For 4 ft. 8 1/2 in. Gauge. Rail 55 lbs. per Yard.	
57 Tons of Rails @ \$70.....	\$6,990.00
400 Rail Splices @ \$1.....	400.00
5,500 lbs. Spikes @ 5 cts.....	275.00
2,640 Cross Ties @ 80 cts.....	2,112.00
2,000 cu. yds. Gravel Ballasting @ 50 cts.....	1,000.00
Laying 1 Mile of Track.....	600.00

Total.....\$10,377.00

2d. For 3 ft. 6 in. Gauge. Rail 35 lbs. per Yard.	
55 Tons of Rail @ \$76.....	\$4,125.00
340 Rail Splices @ 60 cts.....	204.00
3,520 lbs. Spikes @ 6 cts.....	211.20
3,520 Cross Ties, 5 ft. long, 5 1/2 in. @ 40 cts.....	1,408.00
1,200 cubic yards Ballasting @ 50 cts.....	600.00
Laying 1 Mile of Track.....	350.00

Total.....\$5,993.20

3d. For 3 ft. Gauge. Rail 30 lbs. per Yard.	
47 1/2 Tons of Rails @ \$75.....	\$3,562.50
330 Rail Splices @ 50 cts.....	165.00
3,520 lbs. Spikes @ 6 cts.....	211.20
3,520 Cross Ties, 5 ft. long, 5 1/2 in. @ 30 cts.....	1,056.00
1,000 cubic yards Ballasting @ 50 cts.....	500.00
Laying 1 Mile of Track.....	300.00

Total.....\$5,794.70

4th. For 2 ft. 6 in. Gauge. Rail 25 lbs. per Yard.	
40 Tons of Rails @ \$75.....	\$3,000.00
330 Rail Splices @ 50 cts.....	165.00
3,520 lbs. Spikes @ 6 cts.....	211.20
3,520 Cross Ties @ 20 cts.....	800.00
1,000 cubic yards Ballasting @ 50 cts.....	500.00
Laying 1 Mile of Track.....	250.00

Total.....\$5,006.20

5th. For 2 ft. Gauge. Rail 20 lbs. per Yard.	
31 1/2 Tons of Rails @ \$75.....	\$2,362.50
330 Rail Splices @ 45 cts.....	148.50
3,520 lbs. Spikes @ 6 cts.....	211.20
3,520 Cross Ties @ 20 cts.....	704.00
750 cubic yards Ballasting @ 50 cts.....	375.00
Laying 1 Mile of Track.....	250.00

Total.....\$4,051.20

Cost of 4 ft. 8 1/2 in. track, \$10,377.00. Stand. road used.	
" 3 " 6 in. " 6,938.20. Reduc. 33 1/2 p. ct.	
" 3 " " 6,794.70. " 44 "	
" 2 " 6 in. " 5,005.20. " 52 1/2 "	
" 2 " " 4,051.20. " 60 "	

The Baldwin Works, we may say in conclusion, being alive to the fact that we are bound to have roads on the Pacific Coast, have established an agency here. Williams, Blanchard & Co., 218 California street, are the agents in this city.

FIRE-PROOF CLAY.—It is a fact not generally known that the stiff blue clay, which composes the famous east wall of the old Comstock ledge, furnishes a very superior article for the lining of furnaces. It is said to stand the intense heat brought to bear upon the lining of smelting furnaces better than the best of English fire brick. Some of the copper-smelting operators over at Walker river and elsewhere have used it with excellent success for some time past, and a day or two since we saw a load of it from the Savage, or some other mine in the vicinity, being hauled for use at a foundry on the Divide. The supply is certainly in inexhaustible, and sufficient to line the walls of any hot place here or elsewhere.—*Gold Hill News*.

COAL IN LOS ANGELES COUNTY.—About 40 miles east of Los Angeles, coal of good quality is reported as abundant, and is to be worked immediately.

TELEGRAPH LINE TO EUREKA.—Eureka, Nevada, has at last telegraphic communication, the line having been completed on the 10th of April. Congratulatory dispatches were sent to, and received from, various places on the occasion. The *Sentinel*, in commenting on the subject, says with regard to the place:—"A year ago there were a few miners living in the rocks and in tents where the town now stands, and two little furnaces producing from two to four tons of hullion per day, with two or three little stores and as many saloons. Now we have a place of over 2,000 inhabitants. We have fifteen furnaces, and almost as many more will be built within ninety days. We have over one thousand mines to supply furnaces and mills with ores, and the hase hullion product of the district is larger than that of any other district in the Union. We are on the nearest and most easily traveled line from the rich mines of Pioche, in Lincoln county, and the whole country of White Pine, to the Pacific Railroad, and Eureka is in the center of a dozen fabulously rich mining districts in this immediate neighborhood. With a certainty that the narrow gauge road will be completed during the present year, connecting us with the Central Pacific, and without doubt, doubling the present population during 1871, we hail the completion of the telegraph as one more step in the march of progress." We add our congratulations.

IRON ORE.—We took occasion in a previous number of this paper, says the *Elko Independent* of April 8th, to speak of the discovery of a rich and inexhaustible iron mine near this place, the locality of which, at that time, we were not definitely informed of. We have since learned that it is just across our county line, on the edge of Lander, and about ten miles from the railroad. It is not a mine in the common acceptance of that word, confined between casings and of a certain width, but a *whole mountain* of ore. It is of hematite variety, which we believe is rated among the very best qualities of iron. Some nine miles distant from this iron mountain, another large body of ore, known as magnetic iron, has been found, which is said to be of excellent quality, and from actual tests is pronounced to be equal to the best ores of the kind found in any country. Samples of ore taken from both mines, were sent to a leading iron expert in Pennsylvania, who, after a careful analysis of the ores writes as follows in regard to them: "Your boxes of specimen ores were received; the samples of the hematite ores are the finest I have ever seen, and much richer than any in Lebanon Valley. The magnetic ore will compare favorably with the Cornwall ore, and I see no reason why iron should not be made as cheap with you as in Pennsylvania." Here is an industry that never flags for the want of customers, as no metal enters so largely into the commerce of the world, or for which there is a steadier increasing demand by all nations and races than there is for iron. The time, we think, is not far distant when the reduction of iron and its manufacture into the various articles of commerce will form one of the great industrial pursuits of our young and prosperous State. With inexhaustible mines of silver and gold, with lead and the baser metals in abundance, with vast deposits of coal and iron, who can predict the future of Nevada?

ENORMOUS IMPORTATION OF SILVER INTO LIVERPOOL.—On Sunday, March 15th, there arrived in the *Mersey* one of the largest importations of silver that has ever taken place at Liverpool. The *Guion* Company's steamer *Wisconsin*, Captain Williams, which arrived that day from New York, had on board the enormous quantity of 65 tons and 5 cwt. of silver coin, principally Spanish and Mexican dollars, a large amount of which is intended for this country, and the remainder for different parts of the continent. As soon as the *Wisconsin* was secured at her moorings in dock, the work of getting the specie boxes ashore was commenced, and in a short time safely completed. Wagons were in readiness, and the specie was conveyed to the London and Northwestern railway station, where it was placed in 14 closed railway vans, and dispatched to London by an early train on Monday morning.—*London Standard*.

MINING SUMMARY.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, April 15th: The Globe is awaiting the arrival of the President of the Co. and some eastern owners, before making a regular working run.... The body of ore recently struck in the No. 3 tunnel of the M. & N. W. Co., still continues to pan out rich. This strike has caused unusual stir in town and appreciation of real estate.

CALAVERAS COUNTY.

RICH ROCK.—*Chronicle*, April 22d: Forty tons of quartz from the "Zambranna" mine, near Mosquito Gulch, yielded \$2,800, averaging \$70 per ton. The mine is owned by Hœrcher & Co., and has been worked, at intervals, for a number of years. The old Vance mill has been leased by the Co. They have out a large quantity of rock. The vein is about two feet in width and the rock all shows splendidly.

MACHINERY IN MOTION.—The arastra, Thoss' patent, at the Lewis Bros. mine near Railroad, is completed and commenced operations on Wednesday. The machinery works admirably and everything in connection with the mine is progressing favorably.

QUARTZ AT RAILROAD.—Poe & Co. have just finished crushing one hundred tons of rock in Clark's new mill. The quartz yielded \$1,800. We understand the ore was unassorted, everything being worked that was taken from the mine. Several other companies are hauling rock to the mill.

LOWER RICH GULCH.—The mills on the Palomo and Alexander mines are running day and night with good results.

SRUCK IT.—Bates & Co., who for the past year have been prospecting the old Mokelumne Hill Tunnel claim, in Chili Gulch, have at last struck very rich gravel. Ninety dollars were recently washed up: one man's work for five days. It is now believed that the former proprietors missed the main lead altogether, although they took out \$13,000 before abandoning it.

ELDORADO COUNTY.

GEORGETOWN.—Cor. of *Placerville Democrat*, April 22d: The Taylor Co. are nearly down with the second hundred feet of their shaft. They estimate that the ledge will be about thirty feet from the shaft at the bottom. If the ledge proves as good as the one hundred-foot level, the company will put up a twenty-stamp mill. The Eureka started up their mill again last week. They have made improvements to their machinery, and feel confident that they can save the gold. The Crane's Gulch Claim, owned by Whiteside, Stone & Watson, is reported to be paying well, but the parties are reticent. There is room for others to try their hands at mining. I am informed that the owners of the Clipper Mine offer liberal terms to any company that will take hold of it. This mine has come nearer paying for the work done than any in this section, and was worked at a time when very little was known about quartz mining.

INYO COUNTY.

CERRO GORDO.—Cor. of *Independent*, April 15th: The Front mine is turning out 10 tons of rich galena ore per day. Belshaw & Beaudry are taking out 30 tons per day through Buena Vista tunnel. The Ignacio mine, in the Lower Town of Cerro Gordo, is being worked again. The Omega Tunnel, Simson, Hoffman & Brady, near Belshaw's furnace, is in over 700 feet. The silver mines on the east side of the mountains are looking well, and yielding up their rich treasures handsomely. The Oceola have let their tunnel by contract to William Bastion, who expects soon to tap the ledge. The Friendship mine, Devlin & Co., is turning out fine ore. The Wittekind have not got in with their tunnel yet, but are pushing work vigorously. The San Lucas tunnel is progressing favorably, also the tunnel of Mr. Anderson and others, near the San Lucas mine. There is now on hand at the two furnaces between 5,000 and 6,000 bars of bullion, and the furnaces still manufacturing.

DEEP SPRING.—J. D. Hiskey writes, April 10th: We have the furnace completed and fired up, and will be in full blast in a few days. Will start the mill to-morrow. I worked 800 pounds of Paul's tailings through the pan without roasting and got about 60 ounces of amalgam.

MARIPOSA COUNTY.

ITEMS.—*Gazette*, April 21st: George Bernhard has struck rich rock in the Mt. Buckingham mine. He has just complet-

ed a tunnel eighty feet in length on the mine and found a vein two feet thick which shows gold freely. The mill will commence crushing as soon as the road will permit hauling. Mr. Francis, prospecting an old quartz vein in the neighborhood of the mine he is working, has found a well-defined ledge, the rock from which prospects nearly two hundred dollars a ton. The quartz now being taken out of the Whitlock mine is looking splendid. The mill has not yet started. The "Francis vein," situated 13 miles from this place on the Mariposa Creek, continues to pay handsomely.

NEVADA COUNTY.

STRIKE.—*Transcript*, April 19th: Strahan, Rolfe, & Co., at Cement Hill, have made a big strike in their hydraulic claims. In nine days, with modern appliances, they accomplished more than an older company did by the expenditure of \$50,000 in the opening of the claims. They have a good face on the hank, and from two pans of dirt, washed for prospecting the gravel, they took out ten dollars.

RELIEF HILL.—Same of 21st: The Union Co. is sluicing and preparing for drifting. The Eagle have their tunnels into good gravel and will commence drifting next week. The Welch is sluicing now after one clean up which yielded handsomely. The Great Eastern has found gold at the end of the tunnel and is preparing to drift. It has been demonstrated that a rich channel runs from Relief Hill to the North Bloomfield channel, and companies on the lead are preparing for work. The prospects were never better.

RICH.—Same of 22d: A lot of selected sulphuret rock from the Orleans, recently worked at Maltman's sulphuret works, yielded at the rate of \$110 per ton. This Co. has leased Stiles' quartz mill, and a crushing is being made of second grade ore which shows first rate. The Manhattan Co., had some sulphuret rock worked which paid over \$100 per ton. Some rock from the Banner mine, which had paid by mill process \$18, yielded at Maltman's \$80.

ALTA No 3.—*Grass Valley Union*, April 19th: We yesterday saw a sample of the blue cement from the claims of Alta Co., No 3, on Alta Hill. The sample, about the size of the fist, consisted of washed gravel cemented together. Grains of gold, very fine, ran all through the mass. The exhibition of the specimen caused considerable excitement. We are told that the gravel came from the northwest of the shaft and that the bed of it is so thick that the drift does not take in all.

NUCKET.—Same of 21st: Yesterday a man named Reese who is sluicing off old ground, near the Webster Co's, while resting, looked over the stones he had thrown from the sluice. He picked up a piece worth between \$400 and \$500.

BALTO.—The manager is pushing into the hill with all rapidity. When the "rim rock" is reached, the claims will have to be worked through a tunnel. The hill will be too high to work entirely off by hydraulic process. The Baltic is now washing, with fine results; the overflow of gravel from the old channel. The claims will last for years.

OTHER GRAVEL CLAIMS.—Webster Co. are drifting southwest from the shaft, and the bed rock is pitching down. The drifters have lost bed rock. The drift is rich in gravel, however, lumps of gold, and much fine gold being found. McSorley & Co. have quit pipping. They have run up as far as they can go in safety, until a flume is built across the cut. They do not want to cave off the ditch. Lumber for the flume is on the ground. The claims of Black and Landis at Goshen Hill are energetically worked. A heavy water power is being erected for removing large boulders.

SPECIMENS.—Same of 23d: Friday the North Star furnished the most beautiful specimens which ever came out of that mine. The aggregate value is between \$4,000 and \$5,000, but the gold does not alone constitute the beauty of the rock. Layers of sulphurets and gold, galena and gold go all through.

WEBSTER MINE.—Saturday 22d: The Webster made some good pannings. The drift is being run southwest from the shaft, and the bed rock had been pitching. An attempt to sink was made, but the water was heavy. A few pans of gravel were tried, however from the wet shaft. The yield was \$3 to \$6 to the pan. The gold is round and washed. The Co. now think that they have been taking gravel from a bar all the time, and that the real channel has just been found.

PLACER COUNTY.

THE DILLON MINE.—*Herald*, April 22d: The owners, Dillon, Cowan and Himes, had thirty tons of the quartz, just as it came from the ledge, crushed at the Empire

mill this week, which yielded, according to the estimated value of the melted gold, \$2,145 or over \$71 per ton. The first shaft sunk missed the main ledge, but they are now on it and down thirty feet where it shows well defined walls and is nearly three feet thick. From this thirty tons there had been selected seven hundred pounds which yielded about one dollar to the pound. This mine is in the Lone Star or Rock Creek District three miles north of Auburn. The owners are erecting hoisting works preparatory to a systematic development of the mine.

PLUMAS COUNTY.

A Taylorville correspondent of *Quincy National*, April 20th, says that Shinn & Co. have commenced work on the Montgomery copper ledge.

SAN DIEGO COUNTY.

BULLION.—*Union*, 20th: Pauly & Sons shipped to San Francisco per Sacramento, \$2,100 gold bullion from the Julian mines: of this \$800 was from the Helvetia.

SHASTA COUNTY.

NUCKET.—*Courier*, April 22d: This week James Vial brought into town a solid gold nugget which weighed fifteen ounces. The piece was taken out of Vial's claim on the East fork of Clear Creek. About four weeks ago Vial found another nugget that weighed seven ounces.

SISKIYOU COUNTY.

PAYING WELL.—*Eureka Union*, 19: Black Bear and Klamath mines are paying better than ever before. In the Black Bear the ledge on the lower level is larger, better defined and richer than in any above. The Company are running a tunnel which will strike the ledge seventy-five feet below the present level. They have run it nearly 700 feet, and have only 100 feet to go. The Black Bear intend to erect chlorination works during the spring. They are now making brick for the furnaces. G. W. Deetken, Supt. of the chlorination works of the Eureka Mine. Grass Valley, has been engaged to superintend the construction and starting of these works.

LIVE YANKEE.—This, the first quartz claim ever worked on Salmon, after remaining idle for many years, has come into possession of Daggett, Reed & Patton. The owners have changed the name to "Salmon." This claim paid well when it was first opened many years ago, but through bad management and high prices the company became involved and suspended work.

SIERRA COUNTY.

ITEMS.—*Messenger*, April 22d: Parties are at work opening the old Oregon tunnel.... The Bald Mt. tunnel is still in bedrock; work progressing finely.... Bliss, of Eureka, is piping away lively.... The Brush Creek Mine is still under attachment, and in the hands of a keeper.... Geo. Knoll has put up his steam pump at the lower end of Duran Flat.... The Live Yankee Co. are running for back ground supposed to be near the centre of the ridge between Forest City and Cumberland Ravine.... The North Fork Co. of Forest City have their tunnel in eleven hundred feet. They are running for the old Uncle Sam ground, and have one of the best tunnels in that section. Twelve hundred feet more will bring them into pay ground.

TRINITY COUNTY.

CANYON CITY.—Cor. of *Journal*, April 22d: Messrs. Flowers & Smith have commenced opening a claim on the lower end of Red Flat. It will be one of the best in the county. M. L. Knowlton talks of putting up a hydraulic on Petticoat Point. Wm. Guthrie will extend his ditch down the west side of the creek, as far as Rag Tail Bar, and perhaps lower down.

DOUGLASS CITY.—Cor. of same: Smith & Wallace, on Panwauke Gulch, have commenced cleaning up, with the following result: On Thursday, 21 ozs; Friday 40 ozs; Saturday, 12½ ozs; they have yet four days' work to do, and it is supposed that it will pay equally well.

JUNCTION CITY.—We learn that the miners are hard at work, and prospects are favorable.

YUBA COUNTY.

SUCKER FLAT.—*Appeal*, April 20th: The Blue Point Gravel Mining Co. have made their first opening clean-up through the bed-rock tunnel which they were four years in constructing, at a cost of \$146,000, washing up 100 boxes at the head of the flume, taking out over \$40,000; they also declare a dividend of \$80 per share.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Independent*, April 22d: The Independent has its shaft down 40 feet, and has driven a level 60 feet north. The vein is two and a half feet in width, and the rock will pay \$300 per ton.... Argenta has run into another rich chimney on a level with the tunnel.... Gould & Co. had 12

tons of ore from the Hamburg worked, that paid handsomely. It was first-class rock from the shaft, which is down 55 feet.... W. D. Walbridge will commence operations on the Monitor, within a few days.... The Norton and Vance mills are constantly at work.

ELY DISTRICT.

ITEMS.—*Record*, April 16th: The Meadow Valley Co. have erected a fine ore dump. Cars from the tunnel tapping the Summit Shaft are by trestle work run to the dump on the street. Western Extension started up on Friday. The shaft is down 150 ft., a whim has been erected, and business is meant. Wells, Fargo & Co. shipped from Pioche, Saturday, bullion, \$13,198.80 for the Meadow Valley Co.

MORE BULLION.—Same of 20th says W. F. & Co. shipped on the 16th and 20th \$33,991 for the same Co.

CHICAGO MILL.—We learn that this has been leased by Lew Hanchett. It will be overhauled before it again starts up and a Stetefeldt furnace built.

EUREKA DISTRICT.

FURNACES.—*Sentinel*, 22d: The Eureka Consolidated product for April will exceed that for March. The new furnace will be ready the first of next month, and then the company will make double the base bullion that can be made by any other establishment in America.... The Richmond is running on Richmond ore, and J. J. Dunne is getting large quantities of bullion of high grade.... The Roslin is constantly running, and the piles of bullion shipped attest the value of the Elise and Hamburg mines.... The Buttercup is running one furnace on Mountain Boy ore, and another is being repaired. The last month has been one of the best. The bullion is rich and the quantity great.... The Goewey & Hurlbut has been purchased by the owners of the Bullwhacker mine, and will soon be started.... The Jackson furnaces are lying idle, but we presume will soon be doing duty.... The Taylor furnace is still idle, but arrangements are being made to put it to work.

HUMBOLDT.

ITEMS.—*Silver State*, April 22d: Captain Comins of Dun Glen has about completed negotiations for the erection of a mill in the Gem Canyon, to work the ore of the Forlorn Hope mine which has lain idle for several years.... The owners of the Frost mine last week struck a pay streak which assays as high as a dollar a pound. The streak is ten inches in width.... The amount of bullion shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue was \$12,217.

ITEMS.—*Register*, 22d: The White mine still yields rich galena.... The Butte Co. will be working ore in their new mill by June 1st.... The Trenton has been sold to a San Francisco company for \$75,000.... The Meredith shows a ten-foot ledge of good ore. They are running a tunnel at water level. Ten feet farther to go.... Palmer & Boyer Bros. have run a tunnel 45 feet and tapped the Black Hawk ledge 50 feet from the surface. The vein is 18 inches thick.... The Buena Vista are taking out lots of rich ore.... The King William looks splendidly.... Work progresses on the Talulah at Dun Glen.... L. D. Webb has shipped 20 tons selected ore from Second South extension of the old Golconda mine to Rye Patch mill.... A four-foot ledge of fine ore was struck in the Jefferson ledge at the depth of five feet.

WASHOE.

CHOLLAR POTOSI.—*Enterprise*, April 23d: The condition and prospects are good. For the week ending April 22d, the Co. have extracted 1,798 tons of ore and forwarded to mills for reduction 1,891 tons, the average assay of which has been \$75.40. The amount of bullion shipped for the week was \$57,273. During the week a drift south from the Belvidere body has got apparently into a new body of ore, at least ten feet wide.

DANEY.—The drift from the bottom of the main shaft, 300 feet in depth, is in 190 feet. The rock is becoming softer.

OPHIR.—The cross-cut at the top of the "up-rise," (300 feet up) has passed through the clay, but is not yet far enough into the vein matter beyond to enable one to form a decided opinion as to what it may contain. The rock does not present as favorable an appearance as could be desired.

OVERMAN.—About the same ore is being extracted.

CONSOLIDATED VIRGINIA.—The drift is progressing favorably, and the rock presents a promising appearance.

SIERRA NEVADA.—Both mills and all the works of this company are still shut down by the injunction obtained by the Kenosha Co.

SUCCOR.—Work is still being prosecuted on the air shaft 1,000 feet back from the mouth of the tunnel. The usual ore is being taken from the mine.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 11TH.

FILTER.—James Brown, San Francisco, assignor to Ira D. Thompson, same place.

SEED-DRILLING MACHINE.—Oliver Hyde, Oakland, Cal.

DOVETAILING MACHINE.—David Pomeroy, San Francisco, Cal., assignor to Elander Heath, same place.

MACHINE FOR SAWING STAVES.—Assaria Rewrick, San Francisco, Cal.

FLY BRUSH.—David Shankland and Emerson B. Hopkinson, Nevada City, Cal.

AXLE-GAUGE.—Richard K. Vestal, Santa Cruz, Cal.

OIL RESERVOIR FOR AXLE-BOXES.—Ernest Von Jensen and James Munroe McDonald, San Francisco, Cal.

MANUFACTURE OF PNEUMATIC GAS FOR ILLUMINATING, ETC.—John W. Stow, San Francisco, Cal.

REISSUES.

WHEELBARROW FRAME.—Beckwith W. Tuthill, Oregon City, Oregon. Patent No. 110,698, dated January 3, 1871.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

ANKLE-BRACE.—J. S. Niswander, Oakland, Cal. This invention, for weak, sprained or diseased ankles, applicable also for the cure of club or misshapen feet, consists of properly formed metal plates, made to fit the foot, ankle and leg, and united by a concave or cup joint which fits over the ankle joint. This device can be worn either next to the skin or on the outside of the stocking, the boot or shoe concealing it from view. As an instrument for surgical assistance in reducing sprains and supporting weak or broken ankles, it is of great value, and being convenient to put on and not uncomfortable to wear, will be used by many who object to the ordinary splints.

HYDRAULIC NOZZLE.—H. Shaw, Nevada City, Cal. Mr. Shaw's nozzle, for hydraulic mining, is connected with a water-chamber or distributor, by means of a peculiar (C-shaped) pipe. It has several improvements in construction, especially in its interior, so that the water which is forced through it, will be delivered without the twist given to it when the ordinary nozzle is used. Again, it is connected with a novel arrangement for turning it in any direction, vertical or horizontal, as may be required. The entire machine is so constructed that it can be put together without the necessity of using bolts, rivets or screws, thus avoiding the necessity of transporting it in bulk, as it can be put together at the place where it is to be used by any person without need of other instrument than a hammer.

GRINDING MILL FOR ORES.—J. S. Niswander, Oakland, Cal. The object of this invention may be said to be two-fold,—to obviate the necessity of using iron grinding surfaces, and thus avoid the trouble of getting particles of iron into the ore; and to be able to use in the construction ordinary stones or quartz rock taken from the mine. On an iron disk, rock is laid with as even an upper or grinding surface as possible, the stones being laid close together and the interstices filled with smaller rocks or broken fragments. This layer is kept in place by a ring, hinged on one side and fastened at the other in any convenient manner, so that it can be clamped tightly around the bed. The miller consists of a circular rim or shell, with or without a cover, divided into several compartments, in which are placed loosely large stones such as may readily be picked up at any mine. The ore is fed in at the center. These are the principal points, in connection with which are several details of construction, rendering the machine more sensitive and efficient.

Rearing Silkworms.

The following information, being the result of long and intelligent practical experience, will, we think, be found both valuable and interesting.

The Cocoony.

The building to be used as a cocoony should be regulated as to size, so as to accommodate the number of worms to be fed in it. One ounce of eggs is said to contain from 30,000 to 40,000; but we think 30,000 as many as will, on an average, hatch from the ounce. The smaller trevotine or bivoltine kinds may contain more than this number; but we think the larger annual kinds will fall short of it. Taking 30,000 as a basis we may easily determine the space required to feed the worms from any given number of ounces of eggs. One hundred and fifty worms of full age or growth should have at least one square foot of shelf or table room, and one ounce will therefore require 200 square feet, and this increased in proportion as the number of ounces of eggs to hatch is increased. No extra building need be provided for a cocoony if there is a barn or other building on the place that can be spared for use during the summer season. The shelving can be so put up that it can be taken down and laid away, and so kept from year to year. It is said that in many portions of Spain, and in other countries, sheep-hoods are used as cocooneries, and that the smell of old manure is believed to be of no detriment to the health of the worms, but rather a benefit. So a horse barn or hay barn can be cleaned out and used without danger to the worms.

Ventilation and Temperature.

One important matter in fixing up a cocoony is to provide the means for plenty of ventilation. There should be an opening at the highest point to let the bad air escape, and openings at the bottom to let in fresh and cool air; and these ventilators should be fixed so as to regulate the circulation of air at pleasure. There should also be some handy way to wet down the floor (and this may be either boards or well-packed earth) in hot, dry and still days. The evaporation of water judiciously used may be made to keep down the heat two or three degrees in the building below what it would be without the use of water.

Though this is one of the most even or uniform climates in the world, yet the changes of temperature between the nights and days, especially in the open valleys and in the summer season, are greater than in many other countries. Indeed, this regular daily change of temperature is one of the greatest difficulties, in our opinion, with which our silk growers have to contend. With our generally even temperature, if we could dispense with this daily change our climate would be perfect. In this respect the foot-hills have a great advantage over the large open valleys.

To counteract this difficulty many propose building brick or adobe cocooneries. This expense is unnecessary, nor do we believe a brick building good for the worms. The atmosphere in a thick walled, brick building accumulates too much chilling dampness, which is as detrimental as the changes of the temperature. A double wooden wall, with a false roof, would secure all the advantages and be liable to none of the objections to brick. But the same object can be much more cheaply and as effectually secured by covering the sides and roof of the cocoony with tules. The tule makes a covering of the best non-conducting properties. Neither the sun, the wind nor the dampness of a rainy day will penetrate a wall of tule a foot thick. The southern and western sides of the building and the roof only need be covered. The sun should always be allowed to strike the east side of the building early in the morning. It will shorten the time necessary to carry the worms through to cocoons from two to three days, and give them more certain health and better results. Two men can cut tule and cover a building fifty feet square, if they be handy, in two or three days. We speak in reference to this kind of covering from experience.

Artificial Heating.

With respect to artificial heat in a cocoony there are many opinions. In this dry climate we all know that the degrees of heat and cold are not as sensibly felt by the animal system as in a more damp climate. The dry air is a poor conductor of heat; but a damp atmosphere, on the contrary, becomes a good conductor, and hence, in a damp climate we feel the changes of heat and cold much more readily. So with the silkworm. We should take these facts into consideration

when determining the question of artificial heat for our cocooneries.

We think it may be well to have the facilities for heating at hand; but use them only sparingly. We would prefer that the thermometer should not fall below 60 nor rise above 80 degrees in the cocoony. If it could be kept at the mean of 70 degrees it would be better. If the thermometer falls below 60 degrees and remains any length of time, it may be best to use a little fire. But if it only gets down to that figure in the latter part of the night, to rise at the approach of the sun, we would not start the fire. The Chinese on such occasions use a quick charcoal fire which they carry through the building in a furnace. Heating by an open fire or blaze, as in a fire place, is much better than by a close stove.

Hatching the Eggs.

Silkworm eggs will not hatch as a general thing with the thermometer below forty-five degrees. We say generally, because the bivoltines will hatch at a considerably lower temperature than annuals, and Japanese annuals will hatch at a lower temperature than French annuals. If your eggs have been kept in a place below forty-five degrees, and you wish to have them ready for hatching in about ten days, change them to a locality where the temperature remains at about 50 degrees, and in a day or two increase the temperature to about 60 degrees, and then up to seventy, and keep it at this point until they begin to hatch.

Two or three days before hatching, you will notice the eggs changing color from a brownish state to a grayish blue, and the day before hatching to quite a light blue. The worms hatch from six to ten o'clock in the morning, and when you see the little fellows coming out, cut up some tender leaves in narrow strips and lay them around the edge of the paper to keep them from crawling off, also some through the center. As the worms get out of the eggs they start immediately for the leaves and begin to eat.

At about ten o'clock take hold of the strips of leaves carefully and lay them close together on a clean paper upon which you intend to feed them. It is better that the worms be pretty thick when small—so thick that the leaves upon which they rest will look black with them. When you have thus moved all the worms from the eggs, in this manner, cut up some tender leaves, very fine, and sprinkle them over the worms. They will immediately leave the dry strips and go for the fresh cut leaves. Mark the worms, or the paper containing them, the day of the month, and feed them a little once in about five hours during the day time, and if the nights are sufficiently warm, so that they continue to eat all night, keep the feeding up all night; but if the nights are cool, let them miss one feeding in the middle of the night, and then again at four o'clock.

Repeat the process of taking the worms from the eggs each day for about four days, and then throw away those that have not hatched, as they will not probably be very good after that. Be very careful to keep each day's hatching by itself, and keep the papers on which you place them separate, so they will not mix, as this will save a great deal of trouble in the future changes of the worm. Keep up the feeding with finely cut leaves each four hours, being careful not to feed them much more than they will eat until the worms are four days old.

First Molting.

At this age their heads and the foreparts of the body will be a grayish color, and if the temperature has been kept up to about 70 degrees they will probably begin to lose their appetites, preparatory to going to sleep, but if the temperature has been a little lower than 70 they may eat, on the fourth day, more ravenously than on any previous day, and their sleepy time may be delayed until the fifth day or even to the sixth. When they stop eating, stop feeding; as, if you continue to feed them, you will bury them up with cold, damp leaves and thus lose many of them. They will sleep from twenty-four to thirty-six hours, and sometimes forty-eight hours. In this time their bodies shrink and the skin separates from the little black cap that covers the head, the cap falls off and the worm wakes up and crawls out of his skin. This is called molting. When they have thus molted and waked up they are very hungry, but don't feed them any till all the worms on the paper have molted. Be very particular about this so as to keep them all of the same size and so that when they go to sleep the next time, which they will do again in about five or six days, all will sleep and wake at the same time.

By being very careful to keep the worms of the same day's hatching separate, and

thus keeping each day's hatching uniform in size, and putting them all to sleep at the same time, before each molting, much work is saved, and the worms will do much better all through their lives. We should have mentioned that as the worm approaches the time for going to sleep, it changes its color, always looking a yellowish sickly color at that time; and when it fully stops eating, it fastens itself to a piece of a leaf and seems to be stiff and almost lifeless. In this condition they should not be moved or fed or disturbed in any way, but left entirely alone. When going to sleep, also, many of them get down under the surface leaves, so that you can see but few of them on the top. When they have molted, their color is changed and they appear on the surface again and move about in search of food.

A REAL YANKEE IDEA.—Under this heading, the *Arbeitsgeber* gives the following: In order to make dollars, the American inventor exercises his brain mightily, and leaves no working process unstudied, in order to see whether one cannot, by means of some improvement, or by a new method, economize in time and labor, and lead into his own pocket a part of the economy in the shape of money. It is well known that the skinning of cattle takes considerable time. An American has proposed a plan for shortening the process, which will be of considerable importance for large slaughter-houses. The speculative experiments on this subject have arisen naturally where the necessity urges—in the Pampas of South America, where many animals are killed merely for the sake of the hides. The inventor's proposition is to force air by means of an air pump, between hide and skin, thus separating them. We have not yet been informed whether the thing has been put in practice. It is certainly worth the trial.

A NEW GOLD SAVER, says the Nevada *Transcript*, has just been completed by Thom & Allen, at the foundry in this city. It is called Johnson's Batea Separator and Amalgamator. It receives the pulp as it comes from the battery and is designed to save the powdered mercury and gold which escapes from the coppers of the battery. The machines are made of cast-iron, are five feet in diameter, and are covered with sheet copper. The pulp is discharged in a basin in the center and flows over upon sheets of copper sloping towards the circumference of the machine. While this is being done, the machine is kept in motion about the same as a shaking table, causing a friction of the amalgam against the copper plates, and the gold escaping from the battery is caught. Should any quicksilver escape by passing over the plates, it is caught by a gutter of sheet-iron which runs around the rim of the machine, while the water and sand flow over, passing into a sluice arranged to carry them off.

NEW TUNNELING MACHINE.—Over a year ago we spoke of a tunneling machine invented by Col. Von Schmidt, of this city. We believe that some alterations have since been made. The following description is given:—The machine is constructed upon the Severance Diamond Drill principle, but in the mode of application the machine differs materially from all others at present in use. It consists of a circular wheel, eight feet in diameter. Imbedded in the rim of the wheel, each revolving on its own account, will be twenty-four diamond drills, one foot apart. In the center of the wheel is a single drill—and this is kept one foot in advance of the other drills. The wheel is calculated to make 800 revolutions per minute, the drills revolving at a higher rate of speed. The periphery of the tunnel will be on the scale of eight feet; the groove cut by the drills will be two inches wide and three feet deep. It is intended to load the center hole alone, then run the machine back on the track, and raise the lower half of wheel on hinges. The blast is fired, and the great cheese of rock crumbles to pieces. The machine is so constructed as to admit of three feet space inside of the wheels, between its frame work and the bed of the tunnel, and facilities for removing the debris are afforded by an inner car track. The machine will be run by compressed air.

A CHEESE FACTORY of 300-cow power is to be built at Macon, Michigan.

POPULAR LECTURES.

The Classics as Allied to Science.

[Prof. Martin Kellogg before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Fourth Series. Reported expressly for the Press.]

LECT. 1. April 22.—Prof. Kellogg, in commencing his lecture, referred to the changes which had been made of late years in the courses of instruction in our American colleges and also in similar institutions elsewhere. The scientific element is now being made more prominent, modern languages receive a larger share of attention, while the classics have lost the almost exclusive ground which they once held. The professor would not now enter into the discussion of this matter which has been so long and is now being agitated. Believing, however, that there was at least danger of going too far and of unjustly neglecting the ancient languages, he would speak of their claims in certain respects, and, entering into the spirit of the hour, would aim to present the Greek and Latin languages as true helpers to modern science.

The proposition he would make and endeavor to uphold is, that modern science finds most useful allies in the classics, and owes so much to them that it cannot afford to disparage or neglect them.

Science Needs Greek and Latin for its Terms.

Science is obliged to have recourse to the dead languages for terms. The reason of this is that the words in popular use lack definiteness of meaning, and science insists on definiteness and precision in this respect. Take the word "word," for example. What does it mean? The dictionary tells us that it is the spoken sign of a conception or idea; it is also the written character expressing such a term; it means talk or language; account or message; signal and order; statement, declaration or promise; dispute; an expression, phrase or clause; the Scripture considered as the revelation of God to man. You see how indefinite it is of itself. And a host of similar examples could be given, of which the lecturer named several.

Now, we cannot take one meaning without having objections made. Words in popular use cannot be selected because they are in popular use. But we can go back to the dead languages, the Latin and the more flexible Greek, which are rich in more precise expressions, and can take a word, giving it an exact meaning without objection thereto. In this we are aided by the character of those languages.

Classical Study Helps to Communicate Ideas.

Again, classical study helps the man of science to communicate his ideas to others. What is the medium of communication? It is (for us) the English language. Now classical study is the greatest help for the study of the English language and for its expression. The same is true for other modern tongues.

Many words are derived directly from the ancient languages; a number of examples were given. Again, the words which came from Latin and Greek are pre-eminently such as science employs, are pre-eminently the words of intellect, and express accurate and refined thought.

A knowledge of the original tongue causes one to use a derived word more properly and gives force and vividness to it, makes it more clear and calls up a picture, as it were.

Classical Study Needed for General Culture.

For general culture men of science cannot afford to neglect the classics. They are necessary, not only to learn our language, but for language in general. One must go to them for thoughts in which they are so rich.

In order to best learn and best teach scientific facts, we need these ancient languages. By the art of expression, learned therefrom, the scientific men of our day have been enabled to call attention to science and give it its position. If they neglect it, they will lose the present prestige.

Prof. Kellogg cited throughout numerous examples to sustain his propositions, of which the above is a mere sketch. He will lecture again this evening (April 29). The hour is 8 o'clock. The subject will be "The Latin we Speak," and that of the third lecture "The Greek we Speak."

GOOD HEALTH.

A Grain of Wheat.

BY O. L. ANDERSON, M. D.

In a popular journal, such as the PACIFIC RURAL, is, going as an instructor into thousands of families, it seems to me that gross errors should not be overlooked, or passed without correction. That errors will occur in the best of journals we all know. Most of them are so immaterial that the reader will readily make the necessary amend. But the one to which I wish to call attention to has been repeated so often that I am constrained to think the writer labors under the impression that his statements are in accordance with facts.

In the number for April 15th, is an article on "Water in the Stomach," in which this statement occurs:—"Nothing but organized matter seems to aid in building up the system. Meat, flour, corn, barley, etc., when taken into the stomach in their natural condition, undecomposed by either cooking or any other exposure are immediately digested; but when decomposition commences before they enter the human stomach, that decomposition is only accelerated there and they are converted into poisons."

Now if this statement is true it will be necessary to revise our standard works on Physiology and Chemistry. Indeed, the processes of Nature herself will have to be investigated, and different conclusions arrived at, in order to confirm this announcement. I propose therefore to give the history of a grain of wheat as collected from the best and most reliable authorities in order to show what processes and changes it passes through in order to reach its position in the human body.

A grain of wheat is a miniature storehouse containing a great many little bundles of various shapes and kinds of material. How and by what means this storehouse was built does not enter into our history. Suffice it to say that it contains several distinct apartments, and in each one of them there are hundreds of neatly constructed packages done up as no art can more than very rudely imitate. These little bundles are not labelled, but by their peculiar color and shape we always know what they contain. One of the largest compartments is filled with little round packages of starch,—plain, everyday starch, such as we may find any day in our stores. These packages of starch are by no means large. We might place five thousand of them in a row within the space of an inch. Some authors call them cells. Each one has a very strong envelope called "epidermis."

Another compartment contains an article called *gluten*. In fact, this gluten seems not entirely confined to one place. It is all through the storehouse, filling up spaces even between the starch packages. There are also a great many little parcels containing gum, oil, sugar, albumen, phosphates, etc. These are systematically arranged inside this little storehouse.

And now what are all these nice materials intended for? Some one may answer, to nourish man. Not so, in a direct sense. Inside, and occupying a central position, is a vital principle—*life*. We call it the *germ*. Now this germ or life principle can only increase or propagate, by feeding on these stores or their like. Decomposition must take place. St. Paul expressed this fact more forcibly than I possibly can: "*Thou fool, that which thou sowest is not quickened except it die.*" The building up of a body necessitates the tearing down of some other. Organization and disorganization succeed each other continually. The material stored in the grain of wheat is intended to be disorganized by the forces of nature that it may nourish the tender plant. The grain dies that the plant may live.

But suppose the grain of wheat he used for another purpose, that of feeding one of our bodies. We are informed by physiologists, and every day's experience teaches us the same, that in order to bring all these little parcels (cells of starch, etc.) into ready contact with the digestive fluids of the stomach and intestines some means must be used to break the envelopes, for the digestive apparatus acts very slowly or not at all on the epidermis of the grain of

wheat, and not always are the little packages inside broken. But there are several means used to break these enclosures; pounding, grinding, hoiling, etc. Each one of us has a set of grinders (when not decayed by hereditary taint, or disease of our contracting) between which these grains should be broken and triturated. But this process would be laborious and even impossible in some cases. Hence grinding in mills is resorted to, and afterwards boiling, steaming or baking. Water, as a solvent, is necessary so as to divide or decompose the particles and the process of digesting this grain of wheat is thus very much aided.

But what do we mean by digestion? Having broken open the storehouse, and each separate package by whatever means, and scattered the contents over the mucous membrane of a good healthy stomach and along the intestine, the presence of this material calls forth the action of certain glands and vessels and fluids to seize each particle that can be captured, and carry it away to be thrown into that great red stream which flows through the air-circulating apparatus called the lungs. Here a purification takes place. Much carbon and effete matters are winnowed from this stream, after which it is again collected into vessels and carried into the great chamber (the heart) and sent out from there by other vessels to supply the waste which is going on continually. And thus the grain of wheat has been changed from starch, and gluten, and sugar, and phosphates into muscle, nerve, bone, sinew, membrane, and other things analogous in the human body. As a whole the grain of wheat could not be assimilated, but by taking it to pieces and shaping each particle so as to fit in its new place with other materials. We see it again in our bodies and we give it a new name; but after all, the little phosphatic particles that clustered about the "germ," are found in the bones,—and for the present we must leave them there ever wondering at the beautiful processes we contemplate in Nature.

Our correspondent has given a very interesting article on the organization of a grain of wheat, and the changes which it undergoes when taken as food; but we cannot see how he controverts any position which he comments. What we intended should be understood in the extract quoted by our correspondent was, that "when putrefactive decomposition commences," etc. With this explanation we think our views will harmonize with those of our correspondent.

OIL OF PEPPERMINT TO RELIEVE PAIN.—A writer to the London *Lancet* says: "A few days ago, when in China, I became acquainted with the fact that the natives, when suffering from facial neuralgia, applied oil of peppermint to the seat of pain with a camel's hair pencil. Since then, in my own practice, I have frequently employed oil of peppermint as a local anæsthetic, not only in neuralgia, but also in gout, with remarkably good results. I have found the relief from pain to be almost instantaneous."

An American physician has discovered by a long series of experiments, that the weight of persons increases during the hot months. He found that there was a progressive loss of weight from September to March, and a gain from April to August. This view differs much from the commonly conceived idea. So far as our observations have led us, it is quite the reverse. A loss in the hot seasons and a gain as the colder season approaches. In all cases much depends upon climate, habits, dress and occupation of an individual.

BEE STINGS.—A writer to the *Scientific American* says that "a good absorbent" will ease the pain of stings: "The best absorbing substance that I have tried is lean fresh meat. This will relieve the pain of a wasp-sting almost instantly and has been recommended for the cure of rattlesnake-bites. I have also used it with marked effect in erysipelas."

APPLES.—An eminent French physician says the decrease of dyspepsia and bilious affections in Paris, is owing to the increased consumption of apples, which fruit he maintains, is an admirable prophylactic and tonic, as well as a very nourishing and easily digested article of food.

It has been proved that geological conditions have an influence on the health.

Clear Creek County, Colorado.

The Georgetown Committee, appointed to collect statistics with reference to the building of a railroad to their place, have a report, which is given in full in the Colorado *Miner* of April 13th. We give some of the principal items in brief.

The amount of freight received and shipped in the county, in 1870, was 9,330,854 lbs., for which the freight charges were about \$103,000. This represents only the freight handled by merchants, livery stable keepers and mining companies. The amount of smelting ore which would be produced on the completion of the proposed railroad is estimated at 200 tons daily. The amount of wood now consumed exceeds 200 cords per day, unsawn pine costing over \$5 per cord. It is estimated that the daily consumption of coal, were the road completed, would amount to about 100 tons. The passenger travel per day is set down as 15, which number is probably a typographical mistake.

Any such estimates as the above, being difficult to make, are of course merely general. We are inclined, from what we have seen, to think these under-estimates, as the Committee have endeavored to be on the safe side. A railroad to Georgetown from the valley would be of great benefit to the place, and would infuse new life into the surrounding regions. We hope the people will earnestly set to work in the matter, and we suggest that they examine into the merits of the narrow gauge. They can get such a road at a comparatively small expense in a short time; its benefits would be exceedingly great.

COUNTING FLAME VIBRATIONS.—Chas. J. Watson details, in *Nature*, some experiments on vibratory phenomena. "The apparatus made use of consists simply of a card-board disc furnished with radial slits, and which can be rotated with any desired velocity. To examine a coal-gas flame singing in a glass tube, the disc is placed in front of the flame, and the eye placed where the slits pass in a vertical position. When the disc rotates with such a velocity that the interval between two slits passing the eye is just equal to the period of a complete vibration of the flame, the flame appears to be motionless; but if the velocity of the disc be slightly reduced, the flame is seen slowly to go through its changes of form, appearing to consist of a series of puffs, resembling those from the funnel of a luggage locomotive. When the interval between the passing of the slits is equal to, or is one-half, one-third, etc., of the period of vibration of the flame, a singular appearance of a phantom disc is seen, having as many or twice or three times the number of slits really in the disc; this phantom wheel appears motionless if the periods exactly coincide, but if they do not, it slowly revolves in one direction or the other. It is obvious that this affords an easy method of counting the vibrations of the flame. With a sixteen-inch tube I thus found the number of complete vibrations per second to be about 453."

HOW LONG WILL LAND CONTINUE TO INCREASE IN VALUE.—An acre of land was recently sold in the city of London for \$3,600,000, and in nearly every portion of the city land is said to be increasing in value every year. It may be an interesting question, "How long will land continue to increase in value?" Will it ever arrive at a figure above which no one can buy it, and make a profit for its use? Over three and a half millions an acre, and still increasing in value!

TELEGRAPH SOUNDER KEY.—J. Gamble, S. F. This is a very neat device by which the hand can be taught the proper motion for writing with the signal key, and the ear rendered familiar with the telegraphic sounds or clicks, without the necessity of having a battery. It is convenient, neat, and cheap, and is coming largely into favor among those desiring of learning to operate.

DR. JOHNSON said, when in the fullness of years and knowledge. I never take up a news paper without finding something I would have deemed a loss not to have seen; never without deriving from it instruction and amusement.

Table of Contents.

Combined Roasting and Smelting Furnace, Ill.....	257
MECHANICAL PROGRESS.—Powerful Pump; New Thing in Weaving; New Water Meter; Pittsburgh Manufacturers; Perfection of Modern Tools; Cutting Glass with the Blowpipe Flame.....	258
SCIENTIFIC PROGRESS.—Solid Heat; Changes of Weight by Oxidation and Reduction; Eozoon Canadense; Nuclei Promote Crystallization; Reality of Species; Origin of Diamonds.....	258
Notes on Merced County; High Mass in a Mine; Punch and Judy in Europe; Locomotives for Narrow Gauge Roads; Fire Proof Clay; Telegraph to Eureka; Iron Ore; Enormous Importation of Silver.....	259
MINING SUMMARY; Shareholder's Directory; Market Rates.....	260, 261
List of Patents; Notice of Patents; Rearing Silkworms; Real Yankee Idea; Gold Saver; Tunneling Machine.....	262
Classics as Allied to Science; A Grain of Wheat; Clear Creek County, Cal.; Flame Vibrations.....	263
The New Mint; Population of S. F.; Editorial Note Eastward; Suggestion to Miners.....	264
Boiler Injector, Ill.; American Medical Association; Progress of the Silk Business; Coal in New Mexico.....	265
Good Mutton; Hints to Housekeepers; Cooking and Eating; Domestic Receipts; Mechanical Hints; Life Thoughts.....	266
New Publications; Mineral Deposits of Eureka Dist., Nev.....	268

The New Mint.

There is, as most of our readers are aware, a new building now in course of erection in this city, which is to be used in place of the present inadequate mint. For this building a good location has been selected, a large sum of money appropriated, and an imposing structure promised, which shall be an ornament to the city. We have spoken of the progress made from time to time, and have indulged in the hope that the edifice would be a monument of architectural skill and excellent workmanship.

For several months we have watched the course of events, and our hopes, we are sorry to say, have been changed into fears. Instead of an ornament, the edifice bids fair to be a disgrace. It is being constructed of an imported stone, a cretaceous sandstone from Victoria. This rock contains a little lignite in places and considerable iron. On exposure to the atmosphere, the iron is oxidized, and before the building had risen many feet above the foundation, the stone was already discolored. We are now enjoying the sight of an apparently ruinous monument being erected. Again, the separate stones are in many instances being laid at right angles to the natural position, and promise to chip off extensively.

We do not know who is to blame in this case. We have been told that the stone has been contracted for, and that the workmen are obliged to do as well as they can with the material they have. We suppose, then, that it is too late to expect a remedy. We strongly object, however, to the use of public moneys for such ugly things as these. If an earthquake should feel obliged to visit us, it would be a little consolation if it would shake down the miserable object and rid us of it. The present unsightly mint does not trouble us so much as does the new ruin.

The Cocomungo vineyard, which suffered very seriously from grasshoppers last year, is threatened with destruction by them again.

Population of San Francisco.

A new country is particularly sensitive to all criticisms and mistakes. This is perfectly natural. Until it has established the reputation of a firm foundation, it is more susceptible to the light breezes which an older land can afford to let pass unnoticed.

Few subjects are of greater importance in this connection than the matter of population. The taking of the census has excited more individual attention on this coast than elsewhere in our country. Knowing that we are weak in numbers, we desire above all things not to be underrated. Besides, in this State, the two previous times the census had failed to do us justice. This time also, the general belief was that equal injustice had been done.

The publisher of Langley's Directory determined to investigate the matter and to test the comparative value of his statistics. The investigations tend to show that the figures for our city were too low. Large numbers of residents are asserted to have been omitted by the census agents. We have not space to quote the proofs, but we add Mr. Langley's estimates.

In 1847, San Francisco contained a population of 459. The census of 1870 showed a population of 150,361. Langley's Directory for 1869-70 gives a population of 170,250. The publisher, in the number just issued, gives the following as his estimate for the date of January 1st, 1871, based on the most careful researches:

White males over 21, names in the present volume.....	57,550
White females over 18, estimated.....	56,400
White males under 21 and females under 18, estimated.....	56,500
White males, names refused, and foreigners, estimated.....	3,000
Chinese, male and female.....	9,000
Colored, male and female.....	2,000

Total permanent population..... 154,750
To which should be added a large element of our population known as "floating," which consists of: 1st. Transient boarders, etc., at hotels, boarding houses, etc. 2d. Soldiers at the fortifications in the harbor. 3d. Persons engaged in navigating the bay, who claim this city as their residence. 4th. A number of persons who have no permanent place of abode, together amounting to about..... 8,000

Total population..... 172,750
The assessed value of real and personal property for 1870 was \$114,759,511. The rate of taxation was \$3.08 on the \$100. The bonded debt, last June, was \$4,606,500. Deducting \$1,367,122.91, thus in the Sinking Fund, the actual debt was \$3,239,377.09. The annual payments into the Sinking Fund aggregate \$184,000. Municipal expenses last year were \$2,684,433.

The manufacturing establishments of this city, now in operation, number upwards of 800, employing a capital of \$17,000,000, consuming annually material of the value of \$23,000,000, and producing goods worth \$45,000,000. The present state of this great interest can only be told in figures, but a grand exposition will be made at the Mechanics' Institute Fair in September next, which is awaited with bright anticipation.

Since the above was written, the U. S. Marshal has replied. He defends the accuracy of the census, and charges Mr. Langley with inaccuracy. Believing it just in such cases to give both sides, we present the substance of the Marshal's charges. They are, in brief, that several thousand business men included in the Directory do not reside here; that quite one-half of the "floating population" could not be enumerated for the city, as the census takers must enumerate persons at their places of residence; that fully 1,000 persons named in the Directory could not be found at the places of residence there given; that quite another thousand are duplicated in the Directory; that the process of "colonizing" before election vitiates the value of the poll lists for a census; that, for other reasons, Mr. Langley's "estimates" are very incorrect and cannot be accepted in the face of the figures obtained personally by the twenty Federal census takers. As he defies Mr. Langley to show actual proofs of some of his assertions we shall probably hear more of the matter.

Iowa has a "narrow gauge Railroad Company."

Editorial Notes Eastward.—1.

Oakland to Sacramento.

DEAR PRESS:—As you know, it is with strong effort that I have thrown myself out of the routine of office duties for a few weeks, to visit a dear mother who longs to see again her "boy" before her declining steps are even more feeble. While I cannot promise to write you formally when absent, I will yet send you a few items for the forbearing reader.

From Oakland to Sacramento, I cannot say how fine the grain looks by the way, but the wild flowers are out in their gorgeous hues, acres and acres of bright colors clothing our Mother Earth with richer loveliness than is her lot in any other clime or quarter of the globe. They evidently do not take cognizance of a dry season. The scene reminds that while the middle of May is early enough for the tourist to visit Yosemite, yet all comers for sight-seeing would do well to spend a few weeks previous in rambling over one or more of our lovely valleys while carpeted with these annual flowrets.

Our C. P. R. R. train from Sacramento seemed well filled with eastern-bound travelers, but our conductor says that he will return with about double the number of in-coming passengers for California.

A Trip Eleven Years Ago.

One evening eleven years ago, I mounted the "upper deck" of a 6-horse stage, at San José, bound for a journey overland via the southern route through Arizona, Texas, etc. Well do I remember the weariness of the first night's ride. To Gilroy, the novelty of our situation kept us awake, but after midnight came sleepiness. Repeatedly our hands commenced to loosen the grasp which kept us from falling, and repeatedly did we respond to the call of "down heads" to save our bats (and their contents too) from being swept off by the overhanging branches of the wayside oaks.

Breakfast was called at 2 A. M. at the Mountain House. (Dimly responded to.) All day long we crawled through the hot sand and suffocating dust of the San Joaquin valley, to find that we had made a little over a hundred miles, riding all night and all day. Our friends could hardly have recognized us or rated us at a higher grade of color than half-breeds, and we felt just as dirty and disagreeable as we looked, as we entered our second night of perpendicular dose—not sleep.

The next morning we were remarkably polite. Our heads nodded with an incessant repetition to the rising sun, before whose coming a half of the party had even taken off their hats and deposited them by the wayside, riding all the time until his majesty retired to rest, (would that we could have done the same) with heads respectfully uncovered. And this was only the commencement of our twenty-two days' punishment, continued incessantly as we traveled in the crowded, cramped thoroughbrace stage on to St. Louis.

The Difference.

How different our start to-day in the palace car! Here we can enjoy our little circle of friends, amuse ourselves with books and games, enjoy "chatty lunches," and take "square meals" at the stations at convenient hours. Verily, this demonstrates progress for the Pacific Coast.

Anything like a wordy description of a trip over the Central Pacific now would be indigestible. The greatness and completeness of the enterprise are prominent in our recent history. Its engineering management is even more skillful and thorough and commendable than during the rapid construction of this great railroad thoroughfare.

The published photographs and stereoscopic views gave me the best ideas of that part of the route which I had not previously seen, although they are but meagre without the actual natural life which causes the pleasing and lasting impressions one experiences in "going through" them. The best I can do for our appreciative readers is to present them with wood illustrations of the most striking features of the route; for a glance at these will present to them more truth than tongue can utter of the marvelous views. We are indebted to the officers of the C. P. R. R. for the use of the fine engravings. D.

A Suggestion to Miners.

The managers of the Eighth Industrial Exhibition of the Mechanics' Institute are evincing the strongest determination to make the affair a grand success, and a most praiseworthy determination to have every interest of the coast properly represented. One of their latest steps is to make the mining industry prominent, as it ought to be, and, as one of the ways of arriving at this object, they have determined to request specimens of ores, minerals and metals from the various mines of our Pacific slope for exhibition.

A circular has been, or will soon be, issued to the owners and superintendents of mines and mills, requesting contributions. The specimens sent (Wells, Fargo & Co. will transport them free of charge) are to be labelled properly and given a prominent place. Moreover, a descriptive catalogue will be published for general distribution, which will give details containing the mines, mining companies, etc., as furnished by the contributors. The specimen, after the Exhibition has closed, will be placed in the mineralogical cabinet of the Institute, whose property they will then be, where, with the catalogues, they will be open to public inspection.

We believe that this opportunity should not be neglected by miners. A fine collection of ores, etc., will make a powerful impression on our mineral wealth on the visitors who are coming to the Exhibition from various quarters of the globe. It is not enough to talk on this matter; we must give people ocular proof of our capacities, proof that our mines are not exhausted, as some are fond of saying. Let our gold and silver, our lead, quicksilver and copper, our metals, noble and useful, our precious gems, in their varied forms and conditions, from mine, mill and furnace, be here to show that placer and vein and other forms of deposit are still flourishing, and able for years and years to furnish an immense amount of wealth to our country. "To see is to believe." Let our visitors have full opportunity to see. We shall profit thereby. It is one of the best of ways to attract attention and capital.

We have another suggestion. There exist in our mining district journals unsurpassed for energy, activity and ability to advance the interests of their respective sections. We appeal to our brethren of the pen to help on the matter by showing, as they are well able to do, to the miners how a little exertion and generosity now will redound a hundred-fold to their credit and their pockets.

OREGON MEDICAL AND SURGICAL REPORTER.—We have received a number of this quarterly from Dr. H. Carpenter, one of the editors. The journal contains ninety pages of excellent matter, including original communications, selections from various journals, clinical cases, reviews, miscellaneous medical news and editorial notices. It is ably edited, and filled with matter of value. It is published at Salem, Oregon.

THE BIGGEST.—At San Juan Capistrano is a pepper tree said to be the largest specimen of that beautiful variety to be found in the United States. It is seven and a half feet in circumference, with branches spreading over a circle sixty feet in diameter, and stands in the yard of the Pioneer Hotel.

TRUCKEE SMELTING WORKS.—A telegram from Truckee of April 26th says the smelting works of this place, of which C. H. Swain is Superintendent, are turning out a large amount of bullion. Over 20 tons were shipped from here to San Francisco last week.

FLAX.—The Malcolm Bros., says the Monterey Republican have a 300-acre field of flax in that vicinity in full bloom.

Gresham's Boiler Injector.

The improvements hero described, tho invention of Mr. James Gresham, of Eng- land, having for their object tbo increased facility of putting the injector for feeding steam boilers in operation, have excited some attention abroad. We are indebted to tho *Amer. Artisan* for the description and illustration.

In general, an injector cannot at tho out- set lift its water except at a slight depth, but once set in operation its elevating power is nearly or quite equal to that of a pump. When water needs to be drawn from a considerable depth, recourse has been bad to the nso of a reservoir, placed near the boiler and connecting with the steam-jet chamber of tbo injector by means of a snitable pipe. With this ar- rangement, the filling of the lift-pipe with water insured the requisite action of the steam as soon as let on; bnt the inertia of the water in the pipe tends to interrupt the continuity of the lifted jet forced to the boiler.

To remedy this defect is the object of Mr. Gresham's inven- tion. One form of his im- provement is shown in Figs. 1 and 2, the one a front view, showing the device applied to an ordinary boiler; the other on an enlarged scale, a sectional view of strainer and valve provided at the lower end of tbo lifting or aspirating pipe.

The steam pipe and tho re- turn or feed-pipe are each fur- nished with a stop-cock, by which their communication with the boiler may be cut off. The feed-pipe is furnished with a branch, *t*, which extends up to a reservoir, *r*, and is fur- nished with a stop-cock, *l*. The reservoir, *r*, has a pipe, *u*, extending down from it, the lower end communicating with the chamber, *g*², above the valve thereof. From this chamber there extends up- wards the aspirating-pipe, *g*, connecting at its upper end with the steam-jet chamber of the injector. The pipe, *u*, is furnished with a valve operated by the movement of a toothed sector on the outer arm of a lever, *v*, the inner end of which is forked to embrace the needle, the movement of which opens and closes the passage for the steam-jet.

The forked end of the lever, *v*, being depressed, actuates the valve in the pipe, *u*, to open the same, whereupon the water from the reservoir de- scends and fills the pipe, *g*. If now the needle be lifted to permit the passage of the steam-jet, the lever will cause the valve just mentioned to be closed, simultaneons- ly with which the steam will begin to act to raise water in the pipe, *g*, from the source of supply in which the lower end of the said pipe is situated, and the pipe, *g*, having been filled as previously mentioned, the entire lifting force of the ejector may be exerted as well at the outset as after it has been in operation for some time. When the boiler is filled to the requisite degree, the communication of the feed- pipe with the boiler is closed, and the valve, *l*, of the branch pipe, *t*, is opened, wherupon the steam-jet forces water into the reservoir, as it had previously done to the boiler, until the deficiency in the latter from the filling of the pipes, *u* and *g*, is made good, whereupon the parts are brought to their normal position until the boiler again needs filling.

Mr. Gresham has still another plan in which the elevated reservoir is dispensed with. It is represented in Figs. 3, 4, and 5. The modification consists in the ar- rangement at the orifice of the steam-jet chamber of a curved pipe, *k*, exterior to which, is filled the shell, *h*², the contour of which is more fully shown in Fig. 4. The annular space, *h*³, connects by a small pipe with the steam-pipe, *f*, as in Fig. 3, the connection of the small pipe with the annular space, *h*¹, being also shown in Fig. 5. This small pipe is furnished with a stop-cock or valve. By bringing down the needle of the ejector in such a manner as to wholly prevent access of

steam to the reversed cones, yet leaving access of water thereto, and turning the cock in the small pipe to admit steam to the annular space, *h*³, the consequent con- densation of such steam in the space re- ferred to will cause a partial vacuum. This, the space, *h*³, being in communica- tion with the inlet or aspirating-pipe, will cause the water to rise in the latter: which done, it is only necessary to close the cock in the small pipe and raise the needle of the injector, wherupon the operation of the steam in working the injector will pro- ceed in the usual manner.

Fig. 6 represents a variation of the sys- tem just described applied to the Giffard injector, and in which the aspiration of water is wholly through the center. The annular space is arranged in duo relation with the cone, *d*, and communicates with the orifice of the steam-jet chamber, *h*. This space is put in communication with the steam taken to aid the operation by means of a small vertical pipe and a suit- able valve.

The device was patented in 1868 and has since been successfully used.

Fig. 5

Progress of the Silk Business.

One of the greatest drawbacks hereto- fore encountered in the raising of silk- worms in this State has been the lack of a market for cocoons; bnt this trouble will no longer be felt, as the silk factory, which will soon go into operation in this city, will buy all that are offered. They will also buy all the reeled silk that may be pro- duced in the State. It is furthermore the intention of the company to manufacture and send to different parts of the State, at the bare cost of manufacture, reels suitable for taking the silk from the cocoons, and by the aid of which process women and children may be able to utilize their leis- ure, after the busy season is over, in reeling the cocoons which they may have produced during the summer; thus adding largely to the value of the product of the mul- berry patch. All needed instruction will

Fig. 3

Coal in New Mexico.

A late number of the *Cimarron News* contains an interesting article on the re- sources of Colfax county. The writer claims that the county is rich in coal de- posits. We give below some of the state- ments.

The coal so far discovered is in a range of carboniferous sandstone hills, varying in height from 400 to 1,000 feet. These hills commence, on the west, at the junction of the Ute and Cimarron valleys and continue nearly due west. On the east, the hills terminate in a series of spurs which skirt the prairie land. The average length, north and south, is 50 miles. On the Cimarron, which forms the southern boundary of the coal field, coal has been discovered for a distance of at least eight miles up the valley, but the coal-bearing strata widen considerably to the north- ward, having been proved all the way up Purgatoire valley. The width of the coalfield at the north boundary cannot be less than twenty miles; the average width may be taken as not less than fourteen miles, and the area as at least 700 square miles.

Immediately below the sand- stone of these hills lies a dark argillaceous shale of unproved thickness. Whether coal exists below this is not known. The beds of sandstone and coal lie very regular, not a fault or dis- location being discernable; the inclination in the southern portion of the field is about 1 in 100.

The seams have been proved in the bluffs facing the Cim- arron river, three-fourths of a mile from Cimarron. The lowest seam is immediately above the sandstone overlying the black shale. The section of this seam here is: coal, 2 ft. 6 in.; slate, 1 ft. 8 in.; coal, 1 ft.

In the rocks above this, five other coal seams have been traced eight miles up the Cim- arron valley. These same seams have been traced fifteen miles up the Pinel valley.

On the Vermejo and arroyos leading to it, heavy ledges are exposed in not less than thirty different places, from 5 to 11

feet in thickness. The same is seen on Crow Creek and Red River, and on the in- tervening cañons and arroyos. In the Raton mountains, coal, of a thickness of 10 feet, has been proved and is worked for local purposes. Near Trinidad thick seams have been opened out and worked.

The coal is bituminous, very free from sulphur, and has been shown to serve well for household and blacksmith purposes. The above facts are based on observations made by Mr. W. A. Wagner on behalf of the company owning the property.

WORKING ORES AT THE AUBURN MILL.— In the article on this subject last week, under the heading of "Roasting the Ore," Mr. Hofmann gave the number of men em- ployed at the 15 reverberatory furnaces as about 70, which was incorrectly printed 90.

TELEGRAPHIC.—The *London Times* of April 10th, has the following of interest: On Saturday, experiments were made on the European line, *via* Teheran, to work direct without any retransmission between England and India, Bombay and London, interchanging signals perfectly, and a com- mercial message was sent to Bombay di- rect by London at 1:58 p. m., and was in- stantaneously acknowledged. This is the first occasion on which the telegraph has worked direct without any retransmission between England and India. The distance from London to Bombay by the Indo-En- ropean line is six thousand miles.

GRESHAM'S PATENT INJECTOR FOR STEAM BOILERS.

AMERICAN MEDICAL ASSOCIATION.—The meeting of this association in this city, on the first of next month, will be an inter- esting one for the coast. It will bring here many visitors of fine culture and social position. The National Association numbers over 3,000 members and is re- presented by several hundred delegates. It has been in existence since 1847 and has attained a high success in its objects. Its meeting here is an indication of our taking an ever stronger position among our sister States of the Union in the minds of men. Such meetings will give wider and better information of our attainments and capaci- ties among the the people of the older parts of the country. Besides, special in- quiries will be made in this case, it is said, concerning certain matters,—concerning a proper locality for a sanitarium for consumptives, a proper site for a Cinchona or Peruvian bark tree plantation, etc. Thus, in every respect, we have much to expect from this meeting, and we hope that the Association will be warmly wel- comed, hospitably received and helped in its investigations. The S. F. Medical Society is busy making arrangements for the convention, and the Sacramento So- ciety have generously offered to contribute \$1,000 towards paying the expenses. The proprietors of Platt's Hall have offered the place free of charge,

also be sent with each machine for doing such work properly. We look upon this as one of the most useful and promising enterprises ever undertaken in the State.

Silk-growing can be made almost inde- pendent of drouth, and distance from a market. It is an industry which can be introduced anywhere, wherever the cost of living can be made reasonably cheap, and can be conducted on any desirable scale, large or small. It can be introduced up- on every farm, and into every family, and by it the labor of families and children may be utilized to any desirable extent. With the San Francisco factory in oper- ation, and reels distributed as proposed, the silk business of California will have passed beyond the experimental state to a position among the leading industries of the State. Apropos to this subject, the reader will find a very valuable and sea- sonable article, in another column of the present issue, detailing the *modus operandi* of hatching and feeding the worms.

THE IRON WORLD AND MANUFACTURER comes to us as "a representative of Ameri- can metal manufacturers, workers and dealers." It is marked by vigor and fresh- ness of editorials, excellent descriptions of manufactures, improvements and the like, and by the carefulness and accuracy of its market reports. It has the freshness of youth and the ripeness of age, and is de- servedly successful. It is issued by the Iron World Publishing Company, 71 Grant street, Pittsburg.

DOMESTIC ECONOMY.

How to Have Good Mutton.

The following facts, though pertaining more particularly to the butcher's stall, are nevertheless so important to be known in the kitchen, that we have preferred to place them in this department.

The sheep is a delicate feeder, and makes one of the most delicious and digestible of all the butcher's meats. Like most animals, it improves in flavor by age, and attains its perfection, in most breeds, at the age of three years, when it makes *red mutton*—so called, because the gravy, though well done, is red and of high flavor. In feeding sheep for the luxurious table, there should be but few together, which allows them greater variety of food and more repose. In large flocks the strong sheep monopolize the best herbs and grasses, and the weaker ones are poor and mean meat; besides, there are always restless sheep where many feed together, and the others of the flock are ill at ease whilst any are on foot. Sheep well-grazed are better than the stall-fed, and have that "gamy" and juicy flesh so liked by epicures. The best table sheep in the British Isles are the small Welsh breed, which have the wide range of those mountains.

But the best sheep in the world are often spoiled by bad butchering, and I propose to show how this should be done. Many persons become disgusted with, and never eat mutton, because of what they term the "wool-taste." Now, a sheep well-dressed, may be wrapped in the skin and wool, as well as in the purest linen, and never have a "wool" flavor. The intestines of the sheep are like those of all the ruminating animals, very long and powerful in capillary absorption; and, if allowed to remain in the body after death, infuse the odor and flavor of their contents into the meat, and thus give that ill taste. Everything, then, depends upon *rapid dressing*.

While yet alive, the sheep should be suspended by the hind legs, well apart, to two pegs, or hooks, to a cross-timber, so that the body may be easily reached on all sides without turning it. The butcher should be prepared, with a sharp knife, ax, meat-saw, thread, and water; also with a block, or low stool, to stand upon, if need be; for the sheep, when suspended, is too long generally to be easily reached in all parts. The throat should then be cut, severing both arteries, and the blood entirely let out. The skin should then be rapidly taken off, at least from the parts to be cut in taking out the intestines, and pinned back, so as freely to allow that operation. This finished, the blood should be washed out by casting on the body clean water freely. Should the intestines at any time be broken, let them be tied up at once, and the soiled parts well cleansed. The body should hang until it is well dry, when it is ready for use. Mutton (and all meats) never ought to be salted, if possible, until it is ready for the cook. Salt absorbs the juices, dries and preserves the meat, but spoils the flavor. Meat should be hung in a cool, dry place, so that all parts may be aired. All "flesh, fish, and fowl" should be eaten as soon as possible after the animal heat is out. Persons in cities, learn to like "high" and stalemeats, because they get no other; but it is a depraved taste.—*Agriculturist*.

Cooking and Eating.

We find the very best types of piety and christian generosity where the wants of the body are well supplied. For this cause God led his ancient people into the land "flowing with milk and honey." "Milk and honey" were means of grace. Where the soil is fat, the harvest abundant, and the people strong, love to God and man flourish, money is freely given to send the gospel to the lost; people delight to give liberally, they devise liberal things, and enjoy it. Material blessings help the spiritual growth. They may be abused, so may any blessings; yet they tend to make Christians more christian-like.

As eating is so useful and christian, the work of preparing food wisely, temptingly, is exalted. A good cook is equal to a good teacher. Skill in preparing food equals skill in science, or literature, or art, and is usually more useful. Many a business man, many a preacher, many a scholar, has failed from lack of health; and poor cooking spoiled the health. Cooking is an honorable calling; there is science in it; there is philanthropy and religion in it; God is served and humanity is blessed by it. Let no one despise the work of the

kitchen; it ranks higher than embroidering, music, or ornamentation in the parlor. The cook comes before the author in useful service. She is superior to a professor of the fine arts; she supplies the sinews of war, the juices which make muscle and nerve and brain, and force to think and do manly deeds.

But we should eat like men, and not as gluttons; eat to live and work, and not live to eat; eat what will add most to our strength, as men of thought and action, and avoid the hurtful and degrading.—*Ec.*

A Few Hints to Housekeepers.

I have used all the following appliances and can commend them to others:

If the covers of sofas and chairs are dirty they may be cleansed without being removed, by first washing them over with a flannel, then before they are dry, sponge them over with a strong solution of salt and water, in which a small quantity of gall has been mixed. The windows of the room should be opened so as to secure a perfect drying, and the colors and the freshness of the articles will in this way be restored.

Floor cloths may be cleaned with a mixture of magnesia, only milk warm, followed by warm water, in the same manner that carpets are cleansed. They should be rubbed with dry flannel until nearly dried, then wet over with a sponge dipped in milk, and immediately dried and rubbed with a flannel till the polish is restored. This is a process much to be preferred to that of rubbing the cloth with wax, which leaves it sticky and liable to retain dust for a long time. Very hot water should never be used in cleaning floorcloths, as it brings off the paint.

The operation of cleaning mirrors and polished steel articles is an easy matter when rightly understood. The greatest care should be taken in cleaning a mirror, to use only the softest articles, lest the glass be scratched. It should first be dusted with a feather brush, then washed with a sponge dipped in spirits to remove the fly spots; after this it should be dusted with the powder blue in a thin muslin bag, and finely polished with an old handkerchief.

Polished steel articles, rubbed every morning with leather will not become dull or rusty; but if rust has been suffered to gather, it must be immediately removed by covering the steel with finely powdered unslacked lime, and rub it with polishing leather. In these dear times we farmer's wives should do everything within ourselves of this kind, and many others that are expedient, as we all value economy.—*German town Telegraph*.

COURT PLASTER.—It is easy, says the *Scientific Review*, to make this article and so difficult to purchase it genuine, that the process should be known in every household. Soak brushed isinglass in a little warm water for twenty-four hours; then evaporate nearly all the water by a gentle heat, dissolve the residue in a little proof spirits of wine, and strain the whole through a piece of open linen. The strained mass should be a stiff jelly when cool. Now, extend a piece of silk on a wooden frame, and fix it tight with tacks and packthread. Melt the jelly, and apply it to the silk thinly and evenly with a badger hair brush. A second coating must be applied when the first has dried. When both are dry, cover the whole surface with two or three coatings of Balsam of Peru, applied in the same way. Plaster thus made is very pliable, and never breaks.

HOME-MADE SODA WATER.—Beat the whites of three fresh eggs until light, then stir in two tablespoonfuls of corn starch (or fine flour) with half a pint of water. Add 2 lbs. white sugar, and 3 oz. cream tartar and three of tartaric acid dissolved in two quarts of water. Boil the whole five minutes. When cold, bottle, and for soda water fill a half-pint tumbler one-third full of water, adding two tablespoonfuls of the mixture. Finally, stir in ¼ teaspoonful of soda dissolved in water, and the result will be a glass of soda water, very little inferior to that sold in the shops.

TO MAKE BOILED ONIONS LOOK WHITE. Take a white or yellow-skinned kind. Skin them thoroughly. Put them to boil. When they have boiled a few minutes, pour off the water, and add clean, cold water, and set them to boil again. Pour this away, and add more cold water, when they may boil till done. They will be white and clear.

Domestic Receipts.

ORANGE BISCUIT.—Beat the butter until it is cream, and stir it into the white sugar, then mix in the flour and stir in gradually the yolks of the eggs, beaten well; whisk the whites, and mix them with the other ingredients—fill some butter moulds, pour in the mixture, sift some powdered sugar over, and bake them in a slow oven.

LEMON BISCUIT.—Dissolve the soda, mix the sugar, flour, milk, suet and lemon all well together, using milk enough to wet the dough, cut them out, put on greased, and bake in an oven.

HICKORY NUT BISCUIT.—Make same as for savory biscuit; shell and chop the nuts, coarse or fine, and mix in; roll out thin, bake brown.

LYE HOMINY.—To one gallon of shelled corn, add one pint of strong lye, (or one quart strong ashes, if you have no lye,) and sufficient water to boil. Boil until the hull becomes loose, then wash thoroughly; put on and boil a few minutes, then pour off the lye water and add fresh water. Boil now until thoroughly done, and you will have "lye hominy" good enough for any one.

TO GET RID OF FLEAS.—Sprinkle air-slacked lime, in small quantities often around stables, hen roosts, sheds, places where hogs and dogs sleep, etc. It is a sure, cheap, clean and healthy remedy.

TO GET RID OF ANTS.—Drop some quicklime on the mouth of their nests, and wash it in with boiling water; or dissolve some camphor in spirits of wine, then mix with water, and pour it into their haunts; or tobacco water. A few leaves of green wormwood, scattered among the haunts of these troublesome insects, is said to be effectual in dislodging them. They are averse to strong scent. Camphor will prevent their infesting a cupboard, or a sponge saturated with creosote.

SHAVING PASTE.—Spermaceti, almond oil and white wax, of each, half an ounce; melt, and, while warm, beat in four squares of Windsor soap, previously reduced to a paste with rose-water.

TO PREPARE LETTUCE.—Lettuce being a very plentiful fresh vegetable just now may be dressed in several ways, thus giving variety. Prepare a mixture as you would for cold slaw. A cup of rich milk or thin cream, one egg beaten light, a tablespoonful of mustard, a lump of butter half size of an egg, salt to your taste. Set on the fire until the ingredients are thoroughly beaten. When cold add by degrees a cup full of strong vinegar. This mixture poured over the lettuce will make a very appetizing addition to a spring dinner.

Mechanical Hints.

LAPLAND GLUE.—The bows of the Laplanders are composed of two pieces of wood glued together, one of them of birch, which is flexible, and the other of the fir of the marshes, which is stiff, in order that the bow, when bent, may not break; and when unbent, it may not bend. When these two pieces are bent, all the points of contact endeavor to disunite themselves; and to prevent this, the Laplanders employ the following cement: They take the skins of the largest porches (it is very probable that eel skins would answer the self same purpose) and having dried them, moisten them in cold water until they are so soft that they may be freed from the scales, which they throw away. They then put four or five of these skins in a reindeer's bladder, or they wrap it in such a manner that water cannot touch them, thus covered, in a pot of boiling water, with a stone above them to keep them at the bottom of the pot. When they have boiled about an hour, they take them from the bladder or bark, and they are then found to be soft or viscous. In this state, they employ them for gluing the two pieces of their bows, which they strongly compress, and tie up until the glue is well dried. These pieces never afterwards separate.

RULES FOR PAINTING.—1. Let the groundwork be carefully prepared and dry. 2. See that the colors are well ground and duly mixed. 3. Do not mix much more, nor any less, paint than you think will be necessary for the present work. 4. Keep the paint well mixed before using. 5. See that the paint is neither too thick to work well, nor too thin to cover properly, and apply it evenly. 6. Do not apply a succeeding coat before the previous one is dry. 7. Do not use a lighter color over a darker. 8. Do not add driers to colors long before using. 9. Use just as little driers as will do the work. 10. Do not over-charge the brush with paint. 11. Begin with the highest part of your work and proceed downward.—*Builder*.

LIFE THOUGHTS.

The less a man thinks about his virtues, the better we like him.

Prefer diligence before idleness, unless you esteem rust above brightness.

Buy the truth and sell it not; also wisdom and instruction and understanding.

FAITH which works by fear only leads to a selfish, dishonest repentance, if to any.

No person ever got stung by boruets who kept away from where they were. It is so with bad habits.

PRaises are valuable only when they fall from lips that have courage to coudemn.

LIVE to be useful. Live to give light. Live to accomplish the end for which you were made, quietly and steadily shine on, trying to do good.

GETTING in debt is like a mouse getting into a trap—very easy going, but extremely difficult getting out.

We are prone to judge others narrowly by their particular acts. We like ourselves to be judged generously, by our spirit.

THERE is no sin we can be tempted to commit, but we shall find a greater satisfaction in resisting than in committing.

Do daily and hourly your nearest duty. Never mind whether it be known or acknowledged; in the hithersome "sometime," it will have its reward.

SWIFT says: "It is with narrow-souled people as it is with narrow-necked bottles, the less they have in them, the more noise they make in pouring it out."

MANY who bear the loss of a dear child, or of all their property, with the most heroic fortitude, are entirely vanquished by the breaking of a dish, or the blunder of a servant.

Life too Short, Yet Wasted.

Pliny makes a striking computation in regard to the shortness of life. We never recall it without being powerfully impressed by its truth. "Consider," he says, "the time spent in sleep, and you will find that a man actually lives only half his space. The other half passes in a state resembling death. You do not take into account the years of infancy, which are destitute of reason, nor the many diseases and the many cares of old age, those penalties of longevity. The senses grow dull, the limbs are racked, the sight, the hearing, the power of walking, the teeth also, die before us; and yet all this time is reckoned in the period of a life." But short as life is at the best, those who complain of its brevity let it slide by them without wishing to seize and make the most of its golden moments. How much time do we waste in indecision, in vain regrets, delusive hopes, and ungrounded fears! What a vast portion of our previous existence is wasted in mere *waiting*—waiting for something that seems necessary for our happiness, and the want of which prevents us from enjoying the present hour.

THE TRUE MAGNET.—The power of the magnet gains nothing from the gilder's or the graver's art; its attraction lies in itself and is diminished by foreign accretions. So it is with the greatest of all magnets of which Christ spake when He said: And I, if I be lifted up, will draw all men unto me. We may draw men to ourselves by genius, eloquence, eccentricity, but we can draw men to Christ only by attraction of the Cross.

STUDY AND READING.—It has been wisely said, "Beware of the man of one book," that is of the man who has devoted his whole attention to the critical study of any one book. Such an individual proves a very dangerous antagonist in the intellectual arena, and is apt to make sad havoc among good people who read everything but acquire nothing—a vice rather prevalent among men just now.

A HEN with a solitary chicken will often make tenfold the fuss of another with a brood of a dozen or more. The principle is frequently illustrated in life. There are many such hens among the men and women of society. Fuss and feathers not unfrequently tell more than fact and substance.

PEOPLE'S DESIRES.—Some desire to be considered pre-eminently good, others rationally so, and others again are satisfied if their conduct places them beyond the reach of censure.

ADORATION.—Every man cherishes in his heart some object—some shrine at which his adoration is paid, unknown to all save his God.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier.
You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render All other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous.
Please favor us with your orders PROMPTLY, and oblige

THE
IRON WORLD AND MANUFACTURER

IS PUBLISHED WEEKLY AT
Pittsburgh, Pa.,
AND IS THE LEADING—IF NOT THE ONLY—REP- RESENTATIVE JOURNAL OF THE METAL TRADES PUBLISHED IN THE UNITED STATES.

Located in the very centre of the metal interests of the United States, with offices and correspondents at the leading cities in the East, West and South, we do not err in claiming that it is the REPRESENTATIVE JOURNAL of the Metal Manufacturers, Workers and Dealers of this country.

THE IRON WORLD AND MANUFACTURER has a large and extended circulation throughout the United States, and is taken by Iron and Steel Manufacturers, Machin- ists, Founders, Hardware Dealers and Tanners, Gun- smiths, Plumbers, Cutlery Manufacturers, File Manu- facturers, Saw Manufacturers, Boiler Manufacturers, and by

Leading Railway Officials.

It advocates protection to American Manufacturers. Its markets are full and reliable. If you are a manu- facturer, take the journal that advocates your interests. Don't patronize Free Trade journals, but help those who help you.

With Free Trade the manufacturers of this country would be ruined. English gold is scattered with a lib- eral hand to further Free Trade. Expend some of yours to favor Protection.

If you advertise, which is the best medium? Circula- tion being equal, which would you patronize—a Free Trade journal or a Protection journal? Circulation is considered the value of an advertising medium. Much depends on the character of the circulation. The New York Weekly Tribune claims 200,000 circulation, and gets from two to five dollars per line for advertising. The Iron World reaches more people engaged in the metal business than the New York Tribune. Our rates are about ten cents per line. Which will pay the best?

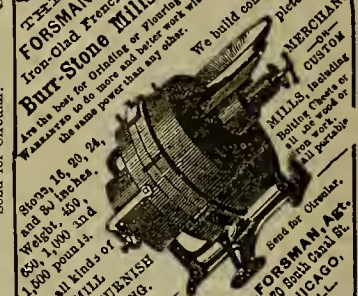

Sample copies mailed Free. Address

New Publications.

HARPER'S MONTHLY MAGAZINE. Harper & Brothers, Publishers, 327 to 335 Pearl street. Franklin Square, New York.

The May number of *Harper's* has just been received. The magazine is an old friend, and we have on our book-shelves a long row of bound volumes. We often take them down for a half hour's recreation and never fail of pleasure in perusing them. In the present number we have, although pressed with work, read several articles, and have been beguiled into spending more time over the pages than we could well afford. We must even confess to having found the Tragical Comedy, or Comical Tragedy, of Punch and Judy of sufficient interest to cause us to finish it at one reading, and to have been highly amused at the engravings. No doubt there is much better matter in the magazine, and none of it is bad, we are ready to guarantee.

WHAT I KNOW OF FARMING: A Series of Brief and Plain Expositions of Practical Agriculture as an Art based upon Science. By Horace Greeley, New York: Published by the Tribune Association. 1871. 8 vo. pp. 353.

What we think of the series of papers which make up this book, has been sufficiently indicated by the fact that we have published them as they appeared in the *N. Y. Tribune*. This was the highest commendation which we could give, and we think that further comment would be superfluous. We advise all our readers interested in agriculture, however, who have not read the papers, to get the book and judge of its merits for themselves. We give here place for a few extracts from the preface with regard to Mr. Greeley's qualifications.

I only lay claim to an invincible willingness to be made wiser to-day than I was yesterday, and a lively faith in the possibility, nay, the feasibility, the urgent necessity, the imminence—of very great improvements in our ordinary dealings with the soil. I know that a majority of those who would live by its tillage feed it too sparingly and stir it too slightly and grudgingly. I know that we do too little for it, and expect it, thereupon, to do too much for us. I know that, in other pursuits, it is only work thoroughly well done that is liberally compensated; and I see no reason why farming should prove an exception to this stern but salutary law. I may be, indeed, deficient in knowledge of what constitutes good farming, but not in faith that the very best farming is that which is morally sure of the largest and most certain reward.

I hope to be generally accorded the merit of having set forth the little I pretend to know in language that few can fail to understand. I have avoided, so far as I could, the use of terms and distinctions unfamiliar to the general ear. The little I know of oxygen, hydrogen, nitrogen, etc., I have kept to myself; since whatever I might say of them would be useless to those already acquainted with the elementary truths of chemistry, and only perplexing to others. If there is a paragraph in the following pages which will not be readily and fully understood by an average school-boy of fifteen years, then I have failed to make that paragraph as simple and lucid as I intended. * * * And, whatever may be the judgment on this slight work, I know that, if I could have perused one of like tenor half a century ago, when I was a patient worker and an eager reader in my father's humble home, my subsequent career would have been less anxious and my labors less exhausting than they have been.

THE SAN FRANCISCO DIRECTORY for the Year commencing April, 1871. Compiled by Henry G. Langley, 612 Clay street, S. F.

This, Langley's twelfth annual directory of this city, has just been published, and sustains the high reputation which it has acquired. We have noticed, in another place, the remarks on the population of our city, which gives us a better showing than did the census which is here shown to be quite incorrect. The volume contains 904 octavo pages, exclusive of advertisements, including over 630 pages of names. It is prefaced by a new map of the city, and gives a directory of streets, public offices, societies, etc., list of civic and military organizations, sketches of public works and buildings, notes on the progress of the city, on railroads, etc., a chronological history, statistics of population, finance and manufactures, and a variety of other matter. The work is of course indispensable to every office, shop and counting room.

THE OVERLAND MONTHLY. John H. Carmany & Co., Publishers, 409 Washington street, S. F.

The *Overland* for May is also at hand. We have said elsewhere that it is good.

We now pronounce it better. The *Overland* is, however, a bone of contention in our office, for so many strive to get hold of it first, and each one wishes to retain it so long. We have present possession, and have nearly finished it, and until we have read every article, we shall keep it safely stowed away for our next leisure moment.

THE BRITISH QUARTERLY REVIEW. January, 1871. New York: Leonard Scott Publishing Co., 140 Fulton street.

The first number of the American reprint of the *British Quarterly Review* has just been sent to us by the Leonard Scott Publishing Co. Briefly, its contents are as follows: The American Press, International Coinage, The Malmesbury Papers, Explorations in Palestine, Early Sieges of Paris, Established Church in Wales, Greek New Testament of Dr. Trevellick, the War of 1870, and a very valuable miscellany of Contemporary Literature. This review now takes the place left vacant by the discontinuance of the *North British Review*; and there is every prospect of its becoming quite as popular as any of the series. The present number is furnished without charge to all who had subscribed for the *North British* for the current year.

Mineral Deposits of Eureka District, Nevada.

We copied an article on this subject, a short time ago, from our lively cotemporary, the *Eureka Sentinel*. We took occasion to make a query for more explicit information concerning a statement which seemed to imply that the irregular superficial bodies of ore were changing at a lower depth to regular veins. That the character of the ore changed with the depth we did not doubt; our question related to the form of deposits, and we asked the question, not as a mere matter of technical terms, but for more explicit information as to a matter of facts. As the *Sentinel* replies, we give place to its answer, which we condense, taking only what pertains directly to the matter. Our friends of the *Sentinel* will understand that we condense simply because a weekly journal cannot expand articles on all subjects. But we are careful to give the gist of the answer in the paper's own words. Believing the *Sentinel* to be as fair in giving facts as it is earnest in helping the interests of its section, we venture on another query concerning an important matter. Can it give us more information as to the change of character of the ore, especially with regard to the "decreasing percentage of the baser metals."

We say, then, that in many instances, within the limits of Eureka mining district, the oxides and carbonates found on the surface appear to be gradually replaced by sulphurets and chlorides as depth is attained, or, in other words, the "smelting ores" of the surface show a decreasing percentage of the baser metals as depth is attained, gradually developing into "milling ores" of which quartz, quartzose, or even silicified limestone constitutes the gangue, the silver taking the forms of sulphurets and chlorides. A yet more concise and specific definition may be—that the predominant ochery gangue of the surface changes, at varying depths, into calcareous and quartzose, while simultaneously the predominant metallic mineral changes from carbonates and oxides on the surface, into sulphurets and chlorides below. Sometimes the ores thus developed in the deeper workings are found in a compact mass or solid body of gangue; and so far as observation can yet be made, show every indication of continuance. In other instances, again, they take the form of huge boulders or detached bodies, apparently liable at any time either to "peter out" or open into a continuous body of ore.

In the instances which have come under our notice, while the change from oxides and carbonates into sulphurets and chlorides is clearly evident, there has been no development of a true fissure vein. [Our italics—En. Press] in the literal scholastic acceptance of the term. But on the other hand, we can truthfully and explicitly state that the Eureka mining district possesses abundant and marked characteristics of extent, wealth, and permanence in its mines. We have, indeed, a huge mineral belt, within the well defined limits of which are found masses, bodies, or deposits (call them what you will), of good paying ore. And though we cannot speak of "well defined walls," the accompanying "clay selvage," etc., we can say explicitly that we have quantity and quality.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

DOCILE Q. M. Co. Sierra county.—April 14. Capital stock, \$1,000,000 in 10,000 shares: F. Smith, W. H. Sears, H. Everett, J. Belden and W. Cadwallader.

CALIFORNIA M. Co. Sutter Creek Mining Dist.—April 24. Capital stock, \$1,600,000 in 8,000 shares. Trustees: D. D. Colton, M. S. Latham, J. D. Fry, H. K. White and G. Wallace.

EXCELSIOR G. M. Co. Tuolumne county.—April 24. Capital stock, \$2,400,000 in 24,000 shares. Trustees: G. F. Wright, J. Keytzen J. L. King, F. J. Thibault and E. Chatin.

The following have been recorded in the Secretary of State's office, Sacramento:

ALTONA No. 1 GRAVEL M. Co. Grass Valley.—April 7. Capital stock, \$600,000 in 12,000 shares. Trustees: W. A. Bateman, A. W. May, J. B. Overton, A. Shepherd and D. Wilber.

GREAT CREYS M. Co. El Dorado county.—April 14. Capital stock, \$200,000 in 2,000 shares. Trustees: G. Rowland, A. Wilcox, Hart Fellows, M. Maus, J. M. Greiss, Henry Fellows, A. C. Vaillant and C. S. Leonard.

SOUTHERN PACIFIC R. R. Co.—April 15. Capital stock, \$70,000,000 in 700,000 shares. Directors: L. Tevis, L. Stanford, C. Crocker, C. P. Huntington, M. Hopkins, C. Mayne and P. Donahue.

BEAR CREEK AND MERCER RIVER CANAL AND IRRIGATING Co.—April 24. Capital Stock, \$100,000. Trustees: P. Carroll, J. Morton and C. M. Blair.

VALLEY M. Co. Napa City.—April 24. Capital stock increased from \$30,000 to \$300,000.

SEATTLE COAL M. Co.—April 25. Capital stock, \$600,000.

Meetings and Elections, Etc.

PACIFIC GLASS WORKS.—April 13. Trustees: R. K. Patridge, J. Anderson, C. Kohler, S. Sweet and J. Taylor.

MONITOR AND MAGNET CONS. S. L. M. Co.—April 20. Trustees: S. D. Woodhull (President), J. F. Woodman, F. Reich, N. Boukolsky and P. Falk. Secretary, L. Kaplan.

HOPE GRAVEL M. Co.—Trustees: W. H. Sharp (President), G. F. Sharp, S. Steinhart, E. Norton and L. Teese Jr. Secretary, L. Kaplan.

SOUTH EUREKA M. Co.—April 24. Trustees: J. W. Mather, G. W. Ramage and W. H. V. Cronise.

NEW INRIA M. Co.—April 24. Trustees: W. E. Barron (President), T. Bell, D. O. Mills, W. C. Ralston and W. Buring. Secretary, E. Mickle.

NOONDAY S. M. Co.—April 24. Trustees: M. J. McDonald (President), O. H. Bogart, L. Vesaria, T. J. Owens and G. W. Cope. Secretary, C. E. Eliott.

SALT LAKE CITY.—Chas. Reticker is agent in Salt Lake City and vicinity for the SCIENTIFIC PRESS and PACIFIC RURAL PRESS.

London Agency.—BATES, HENDY & Co., 4 Old Jewry, E. C., & Co., 30 Cornhill, E. C. London will receive subscriptions and advertisements for the Press.

ALVARADO, March 13, 1871. MESSRS. DEWEY & Co.—Gentlemen: I am happy to acknowledge the receipt of my letters patent on Mop Holder. I am entirely satisfied with the manner in which you conducted my case. I can assure you that I shall not fail to recommend your method of business to all others having patents to obtain. Yours, etc., JNO. BREZEE.

PERSONAL.—Wm. H. Murray, representing the SCIENTIFIC PRESS, of San Francisco, California, called on us this week. He is visiting the principal manufacturing points in the United States in the interests of said journal. The Press is a fine looking sheet, same size as the *Scientific American*, and is now in its 23d volume.—Iron World, Pittsburg.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-hp-t

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the country. The collection, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanic's Institute, care J. H. Gilmore, San Francisco.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and special handy for reference.

Meteorological Observations.

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. I. Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N., Long. 121° 29' 44" W. Height at Levee above mean low tide, at San Francisco, 74 feet. Height of low surface of mercury, 34 feet. The amount of cloudiness designated by figures, 10 being entire cloudiness; 5, half cloudiness; 0, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 0 being a calm, 1 a very light breeze and 10 a hurricane. The means are derived from three daily readings at 7 A. M., 2 P. M., and 9 P. M., in conformity with the arrangements of the Smithsonian Institute.

* Thermometrical. † Rain.

REMARKS.—The week has been characterized by meteorological phenomena of rare occurrence. But slight variations in the pressure of the atmosphere, and the absence of either abrupt or great oscillations in the barometric column, have hitherto indicated the tropical features of the climate. The first decided exception to this rule is now found in an unprecedented fall in the mercury, from 7 A. M. of the 17th to 9 P. M. of the 18th, of .74 of an inch in 2 hours; i. e., from 30.304 inches, at the former date, to 29.564 at the latter; corrected for temperature. To give an idea of the extremely exceptional character of this phenomenon we would add that from our carefully noted hourly observations, the mean difference of the successive means above or below the annual average, is found to be not more than one-eighth of an inch, and that the highest and lowest monthly mean there is found only a fraction over one-fourth of an inch. The extreme annual range is also small. The highest reading ever recorded was on the 19th of December, 1856 (30.619), and the lowest on the 26th of January, 1865 (29.497). This extreme range, however, of 1.122 inches was not sudden, but occurred during an interval of eight years. As might be expected, such perturbations in the atmospheric pressure were not unattended with disturbances in the electrical equilibrium. During this downward tendency of the mercury, on the 17th, between 1 and 5:30 P. M., a thunder storm, as violent as it was uncommon, passed over this locality. During this half hour 1.12 inches of rain and hail fell. Previously during the same rain storm .475 inches had fallen. This brings up the total rainfall here to 1.19 inches. As a matter of fact, being chronicled, we here with append from the *Daily Record* of the 18th of April a popular and circumstantial account of the most remarkable thunder storm ever witnessed by us during 21 years residence in California:

Feaks of Lightning.
"A curious phenomenon occurred about half past five o'clock last evening. At that time a heavy black cloud which overhung the city was suddenly rent, and from it burst forth a vivid flash of lightning—the sharpest flash we have ever seen in California—which was immediately followed by a tremendous peal of thunder, which in its turn was succeeded by a blinding shower of rain, lasting some eight minutes. The flash of lightning was guilty of some few freaks. As a matter of course the telegraph wires were affected by the electricity, which however failed to reverse the instruments but contented itself with merely passing through the offices with the "snapping" always consequent upon such visits. In the office at the depot the electricity entered upon all the twelve wires, making a report as loud as that of a gun. A gentleman engaged in the Central Pacific Company's repair shop, near the Yolo bridge, and who was standing in the doorway at the time, informs us that he distinctly saw the lightning running along the iron track in front of the building, and that it was snapping and sparking at a terrible rate. At the round house it had a more tangible effect, as the lightning struck one of the cupolas, or ventilators, on the roof, passing through it, tearing off several of the slats and knocking out two of the stanchions which supported it inside. The lightning struck finally in the slough behind the round house. Near the building was standing the engineer of the locomotive Vesuvius, who was about to take out his engine. He was knocked down upon his knees by the electricity, but felt no effects from the shock afterwards. At the repair shop near the bridge two men were prostrated, and it was quite a time before one of them recovered from the effects of the shock, which was made apparent by a soreness of his arms and legs. The man who has charge of the telegraph battery room at the depot was also knocked down, but was not seriously affected. At the residence of A. J. Otterson, on Jibboom street, Mrs. Otterson stood looking out of the rear kitchen window when the lightning struck two trees, one only about ten inches from the window and the other some fourteen feet away, seaming and scarring them somewhat. She felt no effects from it. On the contrary, Otterson and his children, who were at work in the yard, were very visibly affected by the shock, all of them being lifted from the ground by it. This flash was followed by two less vividness and two more great peals of thunder, after which all remained quiet, and soon after dark not a cloud was to be seen."

RAINFALL IN SAN JOAQUIN.

EDITORS PRESS:—In your issue of April 6th you inserted a table of rain in this locality from October, 1868, to the first of this month. We have been favored with rain twice since that communication was sent you. From April 4th to the 7th we received 3.30 of an inch. Yesterday (April 28th) we received 1.31 inches, making, in all, for April, so far, 4.61 inches. In this last rain we had just twice as much as in the whole six months previous. Indeed, it is the largest amount of rain that has fallen in this locality within 2 years, since February, 1869. Yesterday's storm was a most extraordinary one for this part of California. An inch and a quarter of rain fell in four hours—from 10 A. M. to 2 P. M. This was accompanied by loud peals of thunder, such as we have had but once before in the last three years. At noon hail commenced falling in great quantities, and soon the ground was as white as if covered by snow. In one place where it rolled from the roof of a shed, it remained for hours after the rain in a pile 20 feet long, a yard and a half wide, and an inch and a half deep in the middle. It was not unusually large, but about the size of garden peas. We have heard of no injury it did to grain. The entire amount of rain up to date in this locality for the present season is now 6.75 inches.

April 18, 1871. J. W. A. WRIGHT.

THE MOST
Important Improvement
EVER MADE ON
SEWING MACHINES
CAN BE SEEN IN USE AT THE
HOWE SEWING MACHINE OFFICE,
No. 113 Kearny Street.
H. A. DEMING, Agent.

Read the following endorsement, signed by our most
prominent physicians:
We, the undersigned, practicing physicians of San
Francisco, having examined and witnessed the operation

MILLS' ADJUSTABLE TREADLE,
For Sewing Machines, take great pleasure in giving our
testimony to the great value of the improvement, in a
salutary point of view.

The peculiar feature of this new Treadle is
that the Foot-board is made Adjustable, both
vertically and Longitudinally, so that whatever
the size or shape of the foot or shoe, the True
Center of Motion of the Foot may Always be
brought to Coincide with the Center of Motion
of the Treadle, and held there, thus Permitting
the Feet to Move on their Natural Centers
Without Having First to Overcome the Inertia
and Weight of the Heavier Limbs.

In our opinion it possesses the following important
advantages over the ordinary Treadle:

First—It saves the excessive labor and waste
of power consumed in keeping up the rapidly
alternating motion of the lower limbs and body
whenever the machine is run with any speed.

Second—It avoids the frequent and serious
injury to female health resulting directly from
that motion.

By the general adoption of this Treadle we believe the
only serious objection to the foot-power sewing machine
will be removed, and that so far from being prejudicial
to the health of the operator, its use will prove as harm-
less and positively beneficial as other physical exercise,
ending directly to develop the muscles of the calf of
the leg, strengthen the ankle, restore the elasticity of
the foot, and promote circulation in the extremities.

Signed,
H. H. TOLAND, M. D.,
President Toland Medical College.
G. HOLLAND, M. D.
H. H. HUBBARD, M. D.
J. CAMPBELL SHORR, M. D.,
Ex-Professor Physiology Toland Medical College.
C. M. BATES, M. D.,
Health Officer,
(Constituting the San Francisco Board of Health).

L. J. HENRY, M. D.,
WM. F. HALE, M. D.,
BENJ. D. DEAN, M. D.,
President Medical Society of City and County of San
Francisco.

WM. T. OARWOOD, M. D.,
DAVID WOOSTER, M. D.,
R. BEVERLY COLE, M. D.,
Professor of Obstetrics Toland Medical College.
J. P. WHITNEY, M. D.,
Emeritus Professor of Physiology, University of the
Pacific.

L. C. LANE, M. D.,
Professor of Surgery, University of the Pacific.
C. T. DEANE,
Professor of Diseases of Women and Children, Toland
Medical College.

I have carefully examined the new Treadle attached
to the Howe Sewing Machine, and consider it a most
valuable improvement, doing away with most of the
motion of the back and pelvis, which is unavoidable in
operating the old style Treadle, and which has proven
so detrimental to health. I cheerfully recommend it to
those who work much with Sewing Machines, believing
it will save them much suffering.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connoisseurs to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Somo of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have
been forged, L. & P. give notice that they have
furnished their correspondents with power of attorney to
take instant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-
ter: Cross and Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. Agents, CROSS &
CO., San Francisco.

PACIFIC BRIDGE COMPANY,

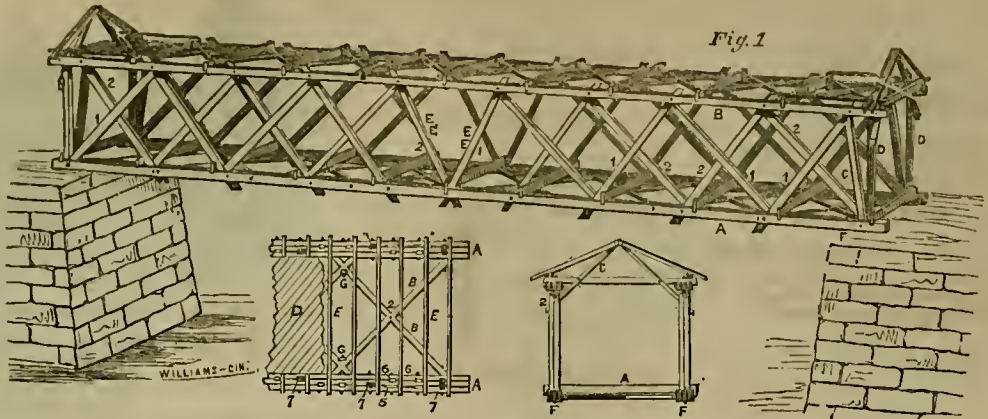

Fig. 1

W. H. GORRILL, OAKLAND, CAL.

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other
Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the
Plan is used. For all Public Bridges the Plan will always be open to competition.

Scientific and Practical
BOOKS
—ON—
MINING, METALLURGY, ETC.
BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.
Published and Sold by
DEWEY & CO.

Nevada and California Processes of Silver
and Gold Extraction, for general use, and especially
for the Mining Public of California and Nevada, with
full explanations and directions for all metallurgical
operations connected with silver and gold from a pre-
liminary examination of the ore to the final casting
of the ingot. Also, a description of the general metal-
lurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of
information, applicable to all vein miners and workers
in precious metals, affording hints and assistance of ex-
ceeding value to both the moderately informed and the
most expert operator.
Price, \$5 in cloth; \$6 in leather—coin.

Concentration of Ores (of all kinds), in-
cluding the Chlorination Process for Gold-bearing
Sulphurets, Arsenurets, and Gold and Silver Ores
generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, em-
bracing the subjects treated. Its authority is highly
esteemed and regarded by its readers; containing, as it
does, much essential information to the Miner, Mill-
man, Metallurgist, and other professional workers in
ores and minerals, which cannot be found elsewhere in
print. It also abounds throughout with facts and in-
structions rendered valuable by being clearly rendered
together and in simple order. It contains 120 diagrams,
illustrating machinery, etc., which alone are of the
greatest value. Price, \$7.50, postage paid.

Roasting of Gold and Silver Ores, and the
Extraction of their Respective Metals without Quick-
silver. 1870.

This rare book on the treatment of gold and silver
ores without quicksilver, is liberally illustrated and
cramped full of facts. It gives short and concise de-
scriptions of various processes and apparatus employed
in this country and in Europe, and explains the why
and wherefore.

It contains 142 pages, embracing illustrations of fur-
naces, implements and working apparatus.
It is a work of great merit, by an author whose repu-
tation is unsurpassed in his speciality.

Price \$2.50 coin, or \$3 currency, postage free.
For single copies of the above works, or for the trade,

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the
Scientific Press, we are obliged to go to press on Thursday evening
—which is the very latest hour we can receive advertisements.

Mauntauca Silver Mining Company—
White Pine District, Nevada.
Notice is hereby given that at a meeting of the Board of
Trustees of said Company, held on the 24th day of April,
1871, an assessment of five cents per share was levied upon
the capital stock of said Company, payable immediately in
U. S. gold coin, to the Secretary, at the office of the com-
pany, 37 New Merchants' Exchange (third floor), in San
Francisco. Any stock upon which said assessment shall
remain unpaid on the 1st day of June, 1871, will be adver-
tised on that day as delinquent, and unless payment shall
be made before, will be sold on the 15th day of June, 1871, to
pay the delinquent assessment, together with costs of ad-
vertising and expenses of sale.
J. M. BUFFINGTON, Secretary,
Room 37, New Merchants' Exchange, San Francisco.

Caution—North America Consolidated
Mining Company—Location of works, White Pine
County, State of Nevada.

Notice is hereby given, that the following named
shares, designated by the number of their respective
certificates, in the capital stock of the North America
Consolidated Mining Company, as by law provided,
were duly advertised and sold in full at public auction,
by John Middleton & Son, on Thursday, the 27th day of
April, 1871, for delinquent assessments thereon and ac-
cruing costs of advertising and sale, and will not be
transferred by said Company:

Blackslee & Williams' Patent.—For
Water, Oils, Acids, Etc.The best COLD WATER
pump for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.Satisfaction guaranteed or the money refunded.

Circular to
W. T. GAR-
RATT, Cor.
Mission &
Fremont
streets, San
Francisco.DESCRIPTION.—D, is a glass chamber which contains
the lubricant. O is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F is the discharge
pipe for the lubricant, provided with an inverted syphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E is a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the action
of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and O. 16v1-tf

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee
that the purchasers shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains,
from \$10,000 to \$15,000 is saved in First Cost.The Wilson Mill will save in working expenses and
repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and he all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its
merits. One can always be seen at the Pacific Iron
Works.Ten of these Mills are now in operation.
For further particulars addressFURMAN R. WILSON,
San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

DARLING & CO.,
Importers, General Agents and Commission Merchants.
Machinery, Merchandize and Supplies of every description Purchased and Sold on
Commission,
AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of
75 PER CENT OF OIL.

They are composed of a transparent Glass Cap, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed NATHAN & DREYFUS, New York, Jan. 1st., 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement; all the several parts are duplicates of each other in the same series; the most skillful workman employed, the best material used and the machinery employed especially adapted to their manufacture. Thus

We warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK or FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages.

FIRST--Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind.

SECOND--Its great economy of both tallow and fuel.

THIRD--It is self-acting, and supplies the lubricating material only while the Engine is in motion.

FOURTH--Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this cup, by its peculiar action, delivers the lubricant

in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

The above Goods are Sold at Factory Rates.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE Ransom Patents, the most perfect Sandstone, specimens of which may be seen in the ornamentation of Dr. Stone's Church, now in course of erection, at the corner of Post and Mason streets. For architectural, ornamental and mechanical purposes, this stone surpasses all natural stone of its class.

GARDEN STONES from this factory, which we make of any desired size, may be seen at many of the great mechanical shops in this city, where they are held in high esteem.

The factory is now turning out Architectural Stone, Cemetery Stone, Grindstones, Garden Ornaments, in the way of Vases, Fountains, etc. The nature of the art admits of our moulding the stone in any desirable form, and enables us to compete successfully with all natural stone wrought by hand. In England, where the stone has been manufactured largely for the past fifteen years, it is considered, for durability and strength, to surpass the best English Sandstone. The British Government employs it largely in its public buildings, both at home and in its Colonies; and as we have secured the services of MR. ERNEST L. RANSOM, late Superintendent of the home works at Greenwich, England, we are turning out stone fully equal to the English standard.

For particulars, apply at the Factory, corner Turk and Larkin streets. mal8-4f

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

Number 18.

Automatic Bobbin-Winder for Sewing Machines.

Persons using shuttle sewing-machines have experienced great inconvenience in winding the thread on the shuttle-bobbins. There is considerable loss of time in performing the winding by the winders commonly provided, and much difficulty in winding the thread with that degree of uniformity which is desirable in order to obtain a uniform tension of the under thread, and make a tight and even stitch. The object of the winder represented in the accompanying engraving is to obviate the above inconvenience and difficulty; and besides accomplishing this it enables a larger quantity of thread to be wound upon a bobbin, and the operator is therefore not so often required to change the bobbin. The device is simple, and can be attached to any shuttle sewing-machine without requiring any alteration of the machine. It is the invention of Mr. C. H. Palmer, of New York. The description is taken from the *Amer. Artisan*.

The engraving gives a front view in perspective. *A* is a bracket by which the winder is attached to the side of the sewing-machine table, *T*. *C* is a small frame which carries all the working parts, pivoted to the bracket, *A*, by a pin, *F*, and having interposed between it and the top of the bracket, *A*, a circular disk, *B*, having a projection, *B'*, on one side, which is impinged upon by a set-screw, *V*, screwing through the bracket for the purpose of regulating the extent of motion of the frame, *C*, on the pivot, *F*.

G, *G'*, are two spindles arranged in line to center the bobbin and hold it in position; both supported in bearings on the plate, *C*. The spindle, *G'*, is movable endwise, to allow the bobbin to be put between it and *G*, and is held up to the bobbin by means of a spiral spring, *N*. The spindle, *G*, is so constructed with pins to enter holes in the head of the bobbin as to compel the bobbin to turn with it when the said spindle is driven by the contact of the driving-wheel, *I*, of the sewing machine, with the friction-wheel, *H*, on the said spindle.

Behind the spindles, *G*, *G'*, there is arranged in bearings on the frame, *C*, a horizontal oscillating shaft, *O*, which has one end turned upward to carry the spool, *K*. This shaft has firmly secured to it a pressure-lever, *D*, the face of which is caused by a spiral spring, *R*, to press upon the thread that is wound upon the bobbin, *J*. Below the spindle, *G*, is situated the fulcrum-pin, *a*, of a cam trip-lever, having on one side of its heel a spur, not visible, which acts upon a projection on the heel of the pressure-lever. The toe of this cam-lever bears against the back of the projection, *B'*, on the disk, *B*. In a recess surrounding the pivot, *F*, and between the frame, *C*, and disk, *B*, there is a spiral spring, not shown, which turns the said frame in such manner as to throw the friction-wheel, *H*, out of contact with the driving-wheel, *I*, when it is not locked in

contact therewith by the action of the toe of the cam trip-lever against the projection, *B'*, of the disk, *B*.

The thread passes from the spool, *K*, through guides attached to an upright spindle, *L*, and thence through an eye in the end of a crane-like leading arm, *M*, which is secured to the said spindle, and thence to the bobbin, *J*. The leading arm is free to swing to and fro over the length of the bobbin, its motion depending simply

of the sewing-machine, and lock the frame, *C*, with the wheel in that position, while the spiral spring, *R*, causes the pressure-lever, *D*, to press against the bobbin. The rotary motion of the driving wheel, *I*, then produces the rotary motion of the spindle, *G*, and of the bobbin, and as the thread is thereby wound upon the latter, the leading arm, *M*, moves back and forth with exact regularity, its motion being regulated by the thickness of the thread.

saving the operator's time. Then again the larger quantity of thread—about one-third more—that can be wound on a spool by this winder effects a further saving of time by making the necessity for changing the bobbin less frequent.

To the Yosemite Valley.

It is to be hoped that our Eastern friends now in this city will not miss visiting other places than San Francisco. Those who have come for pleasure merely, will of course view the different scenes of natural beauty; but too many of our business visitors, strange to say, think that San Francisco is California, and that a stay here of a few days will give them a general idea of the State. Now no one place can represent our State with its varied climates, seasons, conditions and natural beauties and wonders.

The Yosemite is one of our grand points not to be neglected, and now is one of the very best times to visit it. There are several ways to get there. The shortest, easiest and cheapest route is, however, this: By steamer to Stockton, by rail to Milton, by stage to Tamarack Flat via Chinese Camp and Garote, and by saddle train (11 miles) to the Valley. A variation of this, to see the Big Trees, is to branch off from Milton by stage to Big Tree Grove via Angel's and Murphy's, then return to Murphy's and proceed to the Valley via Sonora and Chinese Camp.

There are several reasons in favor of this route besides those of ease, shortness and cheapness. A steamboat trip will be a pleasant change from a railroad ride for our overland friends, besides giving beautiful views of our Bay, the San Joaquin river, Mts. Tamalpais and Diablo, and the country on the way. The hotels on the road are all comfortable and well appointed. More especially, however, the ride through hot, parched and dusty plains is avoided, the route by stage being all the way through a timbered, cool and beautiful country, with magnificent views and easy grades.

However, whatever way they may prefer, let our friends by all means visit the Yosemite. If they take the route indicated, we can vouch for the gentlemanly treatment, intelligence and knowledge of Mr. L. P. McCarty, the general agent at this city, who has been for some time connected with this paper, and who has traversed thoroughly the country along all the routes, besides other sections of our Coast. He may be found at the office of the S. F. Package Express Co., 306 Montgomery street.

THE AGE OF NICKEL.—Some time ago, the Bank of California imported into this city \$5,000 worth of nickel coins, of the denominations of 1, 2 and 3 cents. These are gradually coming into circulation and will possibly effect a desirable revolution in our "bit" and dependent systems. The step is a good one and one of importance to the community, especially to the less wealthy portion.

PALMER'S AUTOMATIC BOBBIN-WINDER FOR SEWING MACHINES.

upon the impinging of the thread against itself as it is being wound upon the bobbin.

To operate the winder, after the end of the thread has been attached to the bobbin, *J*, and the bobbin put in place, the cam trip-lever, *E*, is pushed back until the spur on its heel passes under the projection on the heel of the pressure-lever, *D*. The frame, *C*, and attached working parts of the winder are thus caused to turn upon the center pivot, *F*, by the action of the toe of the cam-lever against the projection, *B'*, and thus to bring the friction-wheel, *H*, into contact with the driving-wheel, *I*,

As the bobbin gradually fills, the thread steadily lifts the pressure-lever, *D*, and by the time it is filled the said lever has been lifted up so far as to let the projection on its heel pass the spur on the heel of the trip-lever, *E*, and so unlock the latter, when the frame, *C*, is instantly turned by the spring before mentioned as arranged around the center pivot, *F*, and the friction-wheel, *H*, being thus thrown out of contact with the wheel, *I*, the winding is thereby automatically arrested.

The automatic stoppage when the bobbin is full enables the winding to be performed while the sewing is going on, thus

MECHANICAL PROGRESS.

IMPROVED ENDLESS SCREW.—Mr. Wm. Goodwin, of New Jersey, has devised a form of the wheel and screw which, unlike the usual form, changes a low velocity into a high one with very little friction. In the usual form, the loss of power is so great, that the screw is generally used to move the wheel, and not the wheel to move the screw; and the arrangement is employed where it is desired to combine great stability in one direction with perfect ease of motion in the other,—as, for example, the steering apparatus of ships. The *Technologist* for April gives the inventor's description as follows:—"The threads and teeth of the wheel and screw, as ordinarily constructed, have a hearing, both while entering into gear, or mesh, and while disengaging; while in the new gear, the threads and teeth do not come to a hearing until the teeth of the wheel have entered into mesh, to the bottom of the groove of the screw. Hence, when the bearing commences, the teeth commence to disengage or draw out of gear, drawing the screw toward the wheel, and thus it is obvious that the friction, caused by the bearing while entering into gear, has been dispensed with by so constructing the teeth that they are fully in mesh before they commence to act or cause friction; also, when the teeth bear, as in the old ordinary gear, while entering into mesh, the screw is strongly pushed from the wheel, thereby increasing the lateral friction in the journal-bearings which hold the screw in position. The lateral friction is also dispensed with by giving to the teeth and threads of the wheel and screw a peculiar pitch and level, which enable them to mesh into gear without coming into contact until they commence to draw out of gear, the level of the thread of the screw being such that the friction, drawing toward the wheel, is equalled by the pressure of the teeth on the bevel of the screw, thus giving the entire pressure lengthwise of the screw-shaft so as to drive it against the step or pivot. Thus it is obvious that the gearing meshes into gear without friction, and draws out of gear with the least possible friction and without lateral pressure, using all the power for revolving the screw, which meets with but slight resistance from the friction of the screw-shaft, the bearings of which are on the end, in the manner of horizontal steps."

BRUNTON'S TUNNELING MACHINE.—The *Engineer* for March 24th, describes this machine. Without diagrams to illustrate a description, we will not attempt one. It cuts a cylindrical tunnel, by means of revolving steel discs advanced as the work progresses by a large screw shaft in the center. To give an idea of the work it does, we quote a short paragraph from the journal aforesaid:—"In driving through the harder rocks, such as grit, mountain limestone, &c., in which the machine would only make a progress of 1 ft. or 18 in. per hour, the amount of debris produced would be such that two men placed one on each side of the machine could easily shovel the stuff as fast as it falls on to the delivery hand. But in softer ground, where the progress would be from 2 ft. to 6 ft. in the hour, men could not shovel fast enough."

WHITWORTH COMPRESSED METAL.—This is now used instead of Firth steel, for the manufacture of the Whitworth gun. The following note upon it is from an article in the *Journal of the Franklin Institute*, by Prof. Thurston, entitled "Iron Manufactures in Great Britain":—"The compression of the metal, which is a 'low steel,' or 'homogeneous metal,' is effected while it is still molten in the mould, by an ingenious method of applying the tremendous force of a hydraulic press. This pressure, which has been carried up to 8 tons per square inch, and which will be increased to 20 tons per square inch, should it be found possible to sustain such a strain, by using moulds encased in the compressed metal, closes the pores, which ordinarily are found so seriously to injure the strength of steel castings, and the metal is given a homogeneity that is usually only obtained by forging under a heavy hammer. It is claimed that a metal can be thus obtained that can be relied upon for a tensile strength of 100,000 pounds per square inch, and a capability of stretching 25 per cent. before breaking."

PROGRESS IN BOILER ENGINEERING.—*Engineering* (London) has the following:—"The increased duty recently obtained from a pound of fuel is almost entirely due to improvements in the engine, and not in the boiler; to heat spending, and not to heat making. In marine engineering the class of boiler introduced with the compound engine is, from its construction, inferior in evaporative duty to the boilers fit for the lower pressure, and there is no more hopeful field of invention than that of 'heat making.' Marine boiler engineering, except as to improved material and workmanship, has been almost stationary for the last 20 years, the only advance being in the increased depth of furnace and length of flame chambers; and in the cylindrical boilers now making by the hundred, this first-named advance has been changed into a state of things worse than existed 10 years ago, as far as the furnace itself is concerned. In stationary boiler engineering, the influence of the various boiler inspection associations and the increased intelligence of the steam user, have greatly improved the manufacture of boilers, and thus facilitated the use of steam of a higher pressure. This has indirectly tended to economy; but the evaporative duty remains almost stationary, and averages at least 30 per cent. less than ought to be obtained."

MALT WITHOUT GERMINATION.—A new method is announced, by which a wort can be produced from barley, without germination. The process is as follows: The barley (fifty parts by measure) is put into a vessel, and steeped in thirty parts of sulphuric acid diluted to one per cent.; the vessel is then covered lightly, and placed in a water bath, kept at a steady temperature of 105° Fah. The vessel must be left in the water bath for seventy-two hours, and the contents frequently stirred to insure contact of the acid with all the barley. At the end of the process of steeping, the barley becomes soft and easily crushable, the silica in the bran being destroyed by the acid. It should be dried, and then has the appearance and smell of malt, and, we are assured, makes an excellent wort. The saving of time and trouble are altogether in favor of this process, which the inventor, Dr. Fleck, of Dresden University, has lately discovered, and on which he is now laboring with a view of rendering it practicable on a large scale.—*Sci. Am.*

THE SHERMAN PROCESS A FAILURE.—The *London Mining Journal* for April 1st, in a notice of the late session of the Iron and Steel Institute, remarks:—"The most careful and impartial trials have indisputably proved that Mr. Sherman's physicking produces no appreciable effect whatever on the iron, and that the process is thoroughly worthless. Neither sulphur nor phosphorus are removed by it, and the value of iodine, as an improver, may be altogether doubted, seeing that Mr. C. W. Siemens has not only tested the flux, but tried considerably increases dose also, the result being in every case identical—no appreciable difference."

ROLLING MILL AT LAGRANGE, PA.—The *Lagrange American* says the contract has been signed by P. C. Brinck, of Philadelphia, President of the United States Iron Company, by which that company agree with the city authorities of Lagrange, to erect and maintain in that city, a rolling mill of 25,000 tons capacity, annually, to cost not less than \$600,000, to employ not less than a million dollars capital, and to be in running order within two years from the date of contract. To obtain this, the city of Lagrange furnishes the ground and donates \$200,000 to the company.

SCOTT'S ROTARY ENGINES.—These consist of a pair of cylinders for each engine, in which a spindle revolves, such spindle carrying a piston made in the shape of a screw fan, being at such an angle that the second blade catches a fresh supply of steam before the first delivers to the exhaust. The reversing gear is made in the same way as for the slide or side valve of an ordinary fixed cylinder, the reverse action being secured by moving the handle to which the valve rods are secured so as to change the direction of the inlet or inject and the exhaust.—*Colliery Guardian*, March 17th.

THE LIFE OF RAILS.—The last annual report of the Lehigh Valley Railroad Co., says that the first set of iron rails laid upon the soles at Packerton, lasted 1 year and 23 days, and passed 2,263,675 tons. Steel rails laid May 28th, 1869, have passed 5,509,381 tons and show no perceptible wear. The company has contracted for 1,000 tons of steel rails, to be laid this year.

SCIENTIFIC PROGRESS.

REV. H. HIGHTON ANSWERED.—Prof. Morton notices, in the *Journal of the Franklin Institute*, the papers in the *Chemical News* by Rev. Mr. Highton upon the maximum of power in the galvanic battery. After remarking that the aforesaid gentleman maintains in fact the possibility of perpetual motion, or the development of power without a corresponding expenditure of force, Prof. M. says: "The theory of the daring author is briefly this: A battery current, passed through a given electro-magnet, will lift a given weight. If, now, we double the cross section of the wire of the said electro-magnet, and also its length, the resistance of the circuit remaining the same as before, the current developed by the battery and the consumption of zinc will remain as before, and yet the lifting power of the magnet will be doubled. Or, in place of increasing the size and length of wire, several similar electro-magnets may be so introduced in the circuit as to produce the same effect. Such a process continued indefinitely would, of course, enable us to develop any amount of magnetic force from a given battery. So far, well; but we have not yet come to the development of power, which implies motion. For this, it is evident that the electro-magnet must be charged and discharged, and here comes the compensating condition. To charge a double length of wire will take just twice the time, and therefore cause a double expenditure of zinc in the battery. Our author, in fact, notices this, but remarks that 'the electric current is so rapid that this difference of time is inappreciable within any practical limits.' Without doubt, to advocates of perpetual motion, but not to those who can see that two millionths of a second are as much twice one millionth as two centuries are twice one; or to the zinc, which, having to work twice as long at each effort, will be doubly exhausted when a given number of actions has been completed."

THE NEW ARCTIC EXPEDITION.—Capt. Hall expects to leave New York by the 15th of May, in the *Polaris*, a powerful Government tug-boat, "sharp as a knife, top-sail schooner rig," of 400 tons burden. Mr. John Morrison, an old whaler and shipping agent, is intrusted with the duty of selecting the twelve men who are to go before the mast, every one of whom will be able to navigate if required. The steward is the same who accompanied Capt. Hall in his five years' exploring expedition. Capt. Burdington of Connecticut will be sailing master. The *New York Times* of April 17th, says:—"A scientific corps will accompany the expedition, including the eminent chemist, Dr. Bessells, of Heidelberg, who arrived here a few days since from Germany, and who formed one of the scientific corps on board the North German expedition to the polar regions."

METACINNABARITE.—*Silliman's Journal* for May gives the result of an examination made by G. E. Moore of a specimen of black mercury-ore collected in Lake county, California, by Prof. Whitney. "It occurs as a coating on the sides of cracks and crevices in a peculiar quartzose gangue, and is accompanied by crystallized and massive iron and copper pyrites, and very minute cochineal-red crystals of cinabar." "Moore concludes that it is completely identical with the black amorphous mercuric sulphide of the laboratory, and proposes for it the name Metacinnabarite."

NATURAL SELECTION AS APPLIED TO MAN. Following is a paragraph from a review of Darwin's new book by P. H. Pye-Smith in *Nature* for April 6th:—"In the fourth chapter Mr. Darwin discusses the manner in which man was developed. It is shown that the broad facts on which the theory of Natural Selection rests apply to him. He is prolific enough to share in the struggle for existence. In him, as in all organic forms, there is a constant tendency to growth, which being checked and modified by external influences, proceeds in the direction of least resistance, and so produces the variations which are often ascribed to

an assumed inherent tendency. Among the various forms produced, those will survive which are best fitted for the surrounding conditions, and they will transmit their character to their descendants, still subject to the same liability to vary. Next the author argues that the mental endowments of man, including language, his social habits, his upright position, and perfect hands, are of direct advantage to him in the struggle with other animals and with his fellows. It has always appeared that the difficult point in the development of man by Natural Selection is at the period when he was more defenceless than an anthropoid ape and less intelligent than the lowest savage; but Mr. Darwin thinks that the transition may have been safely made in some large tropical island where there was abundance of forest and of fruit."

THE BEST FORM OF BUNSEN'S BATTERY.—S. P. Sharples details in *Silliman's Journal* for April, a series of experiments, the result of which was to fix upon the following as the best battery for ordinary use. It costs but little more than the Bunsen battery charged with nitric acid alone, is entirely free from fumes, and is perfectly constant for twelve hours. The electromotive force is the same as that of the Bunsen cell. The directions for preparing the liquids are as follows: "To prepare the exciting liquid, sulphuric acid of 1.84 sp. gr. is mixed with nine times its volume of water and allowed to stand until the precipitated lead has all settled. The clear acid is then decanted and is fit for use. This plan of preparing the acid has been in use in this laboratory for some years and gives very good results, local action being almost entirely prevented by the removal of the lead. To prepare the absorbing fluid, ordinary nitric acid is saturated with potassic bichromate; this should be done in a warm room, as it takes up much more when warm than when cold. The solution thus prepared is mixed with one-third of its volume of sulphuric acid and enough water added to re-dissolve the chromic acid precipitated. Two objects are gained by adding the sulphuric acid. The mixture is less expensive than if pure nitric acid is used and the internal resistance is decreased. If the internal and external cells are properly proportioned, this battery will run until the exciting fluid is exhausted, without giving off any fumes of nitrous acid."

VERTICAL CIRCULATION OF THE OCEAN WATER.—The report of Messrs. Carpenter and Jeffreys on "Deep Sea Researches" is concluded in *Nature* for April 6th. We give the final paragraph:—"In conclusion it may be added that the doctrine of a general vertical oceanic circulation is in remarkable accordance with the fact now placed beyond doubt by the concurrent evidence of a great number of observations, that whilst the density of oceanic water, which is lowest in the Polar area, progressively increases as we approach the tropics, it again shows a decided reduction in the intertropical area. It has been thought that an explanation of this fact is to be found in the large amount of rainfall and of inflow of fresh water from great rivers in the intertropical region; but it is to be remembered that the surface evaporation also is there the most excessive, so that some more satisfactory account of the fact seems requisite. Such an explanation is afforded by the doctrine here advocated; the polar water which flows towards the equator along the bottom of the ocean basins, being there pumped up and brought to the surface. And it is not a little confirmatory of the views advanced in this report that in a recent elaborate discussion of the facts relating to the comparative density of oceanic water on different parts of the earth's surface, the doctrine of a general vertical circulation is advocated as affording the only feasible rationale of them."

ALLOYS CHEMICAL MIXTURES.—It has been proposed in England to call alloys chemical mixtures. That they cannot be called mechanical mixtures, the fact that only the forces at the command of the chemist can separate them into their constituent proves. By no merely mechanical means could alcohol be separated from water or the zinc from brass; heat would, in both cases, play the principal part—and this force belongs to the domain of chemistry. As some metals will mix in any proportions, but still partially retain the character of chemical compounds, no objection can be made to the new definition. The term seems a fit one to rank between chemical compounds and mechanical mixtures.—*Eng. & Min. Journal*.

CORRESPONDENCE.

"Alkali."

EDITORS PRESS:—I wish some of your scientific correspondents would give us farmers the meaning of the word "alkali," as used in California and elsewhere on the Pacific coast. "Alkali" blinds our eyes, stuffs our noses, and chokes up our throats, as the railroad cars whirl us over the alkaline deserts that border on our State. It impregnates much of the water we drink, giving it the quality of going down "slick," and it appears as a white saline incrustation on some of the land we till. But although so universally visible, all the explanation one gets, on inquiry as to what "alkali" is, is that "it's alkali."

My smattering of chemistry teaches me that an alkali is something that combines with an acid to form a "salt;" potash, soda and ammonia being familiar examples.

By the way, this last is an article of priceless value to the farmer's manure heap, and unless tenderly cared for is apt to resolve itself into "airy nothingness;" it is distinguished as "the volatile alkali," that one understands; but any of your readers who can inform me what the "alkali" is that is so common throughout the country, what crops it benefits, and what it injures, will confer a benefit on farmers and the people generally.

We are told that beets grown on "alkali" soil are of less value for sugar-making; although the land in question produces a larger crop of such vegetables than of anything else.

When I speak to my Spanish neighbor as to sowing some other seed, he shakes his head and tells me the soil contains too much *salitre*, and cropping with beets is the way to get rid of the *salitre*. Surely, this is an instance where science should tell us what to grow. E. B.

The three oxides, potassa, soda and ammonia, (also lithia) are commonly called alkalies, or caustic alkalies; potassa was formerly called vegetable alkali; soda, mineral alkali; and ammonia, volatile alkali. Lithia is rare, and possesses properties similar to those of potassa. These are grouped together in a class, the alkalies, from their many characteristics in common,—from their solubility in water, their taste, their strong, caustic action on animal and vegetable substances, their union with oils and fats to form soap, their neutralizing and forming salts with acids, their changing reddened litmus to blue, etc., etc. The word alkali is from the Arabic word for the ashes of a plant used in the manufacture of glass and rich in soda.

The alkalies have a great affinity for carbonic acid which they absorb eagerly from the air, becoming converted into alkaline carbonates. The carbonates of potassa, of soda and of ammonia, are very soluble in water and have an alkaline taste and basic reaction.

A very common rock in our interior country is granite, especially soda granite or granite containing, as one of its principal constituents, soda felspar, a well-known mineral. Soda granite decomposes easily and the soda is converted into carbonate of soda, which is taken up by the waters. Such waters give rise to alkaline springs and alkaline lakes, which having, as in so many cases, no outlet, their waters become very concentrated by evaporation. Other carbonates are affected similarly to some extent. There was a geological time when such action was going on to a much greater extent than now, when alkaline springs and lakes were more abundant in our country.

These few brief remarks will perhaps suffice to show our correspondent how it is that we have so much "alkali soil" in our land, this "alkali" being, to a very great extent, carbonate of soda, mixed with other substances. In the *RURAL PRESS* of January 21st, and in the *SCIENTIFIC PRESS* of February 11th, the reader will find an article showing how alkali soils may be reclaimed.

The Cochineal of California—Its Production.

EDITORS PRESS:—In the *Country Gentleman* of March 30th, there is an article by a Californian upon the adaptability of our soil and climate to the growth of the *Cactus Opuntia*, for cochineal purposes. The writer has a correct idea about the wonderful resources of this State in regard to the small valuable products; and it is to be hoped some of our culturists will turn their attention to the cultivation of such products. There is no doubt that the healthful sections of Southern California afford the very best opportunity for the successful growth of cactus, olive, and other valuable productions of this class.

The manufacture of choice and expensive oils should also be considered. Other branches of industry should also be opened as an inducement to the manufacturing migration—that class which understands how to use our opulent resources. Our capitalists should take a more active interest in such matters. It is a subject of gratitude that Eastern papers are publishing reliable statements relative to our natural advantages, and the opportunities which California so humbly offers to the enterprising sons of labor.

The correspondent of the *Gentleman* truthfully says: "The *Cactus Opuntia* grows without irrigation—a great item to the California cultivator, and the principal expenditure is for labor, when the bugs are collected, every six months, while without any preparation they are ready for market." The *Cactus* grows spontaneously in Los Angeles and other southern counties, and requires but little attention. It is really a native of the climate of that portion of the State.

As a sample of the revenue which this branch of industry might bring to the Californian, we quote further from this correspondent, as follows: "A tree of full height, well trimmed, would give a yield of twenty pounds, more or less, annually. A good quality commands \$2.50 per pound."

People East and in Europe are constantly making inquiries relative to different branches of labor, etc., in California; and there can be no doubt that when the resources of our State are correctly understood by the emigrating masses, we shall offer homes and business to experts in these choice manufactures. It is not kind to California to publish glowing accounts of overestimated products and rapidly accumulating fortune. This has been a grievous error on the part of too many of our writers; but for the plain practical hints, such as we find from the pen of the correspondent of the *Gentleman*, all California is indebted. We have resources of wealth which have seldom been spoken of in public print; we have avenues of labor, as yet unknown to the people; and there are industries to be established which will require skill, labor and experience, as well as capital. We look for help in the final development of all this from the incoming immigration of all countries. We certainly feel a confidence in the *SCIENTIFIC* and the *RURAL PRESS* of California being able to do much to aid this result. E.

Protecting Trees from Grasshoppers.

EDITORS PRESS:—I wish to call the attention of your readers to a means of protecting trees from the ravages of jumping grasshoppers—those which fly it will, of course, not answer for—but in many parts of this State, Nevada, Colorado and Utah, they collect together in bands as the feed drive up, when they are from a half to over an inch long, and destroy every green thing that comes in their way, as they did last year in Yolo County, and the year before down here.

On their appearance here, my brother having a nice garden of 1½ acres, had it about all destroyed in two or three hours, on the first day of May, whilst he was on a visit to the village near by. On his return to his house he found two pear trees unharmed still, and went to work to devise some way to save them. After a variety of experiments, he at last put a piece of flat tin around the tree, cutting a hole in the center just large enough for the body of the tree, and a slit cut out from that so as to get it on; it was soon placed so as to present a flat surface extending out from the tree about four inches in every direction; still they would continue, now and then one, to succeed in crawling out on the under surface of the tin to the edge and getting over, until the idea of putting grease upon the tin came into his mind; after that was done, no grasshopper could

get to the tree, and to test the invention further he went to a neighbor's, who had a fine peach orchard, a part of which was not yet destroyed. When the greased tins were put around those trees, I saw them piled up under the same, destroying each other; but they could not get over the obstruction. I saw some jumping almost straight up under some of the lowest limbs; but they could reach none over two feet high. We have prepared to protect our garden, should they come again, by having a tight fence with a two-inch wide strip of greased tin at the top.

ISAAC B. RUMFORD.
Orange Grove, Tulare Co., April, 1871.

Bull Run District, Nevada.

EDS. PRESS.—I will again send you a few lines concerning this district. The snow is fast disappearing on the mountains and now remains only in the valleys. Several companies are commencing operations for the coming summer, among which may be named the Norwich, the Porter, the New York and others. As yet we have no cause to complain with regard to the extent of our mines, all those which have been prospected to any depth showing decisively that they hold out well in width and also improve in quality with the depth.

It would be difficult for any one to say just how much ore will be shipped from here this summer, yet there can be no doubt but that it will exceed thousands of tons. As for ore to be milled here, the following is not an over-estimate of the amount which might easily be got out, all of it to exceed \$100 per ton: Nevada No. 1, 10 tons; Nevada, No. 2, 25 tons; Nevada, No. 3, 5 tons; Porter, 5 tons; Johnson, 10 tons; Lady Don, 10 tons; Norwich, 15 tons; Blue Jacket, 20 tons; Ontario, 10 tons; J. F. Chellis's various mines, 40 tons; Pennsylvania Hill mines, 50 tons; other mines of the district, 30 tons. Grand Total, 230 tons daily; and out of this, 50 tons may be sorted which will yield from \$200 to \$400 per ton.

I have good reason to believe that, were there sufficient machinery and mills here to work the ores as they are taken out of the mines, a greater quantity than the above would be produced daily. But as it is, the majority of the miners and mine-owners here are so situated as not to have sufficient means for carrying on mining on a very extensive scale without frequent returns, which, up to the present time, it has been difficult to get.

BULL RUN MINER.

Bull Run, April 5, 1871.

The Public Lands.

The question of land grants is being agitated in a very lively manner. The matter of grants to railroad corporations is made prominent, and is even becoming a political question. That it should enter into politics, we are sorry to see, for, important as it is, when once made a partisan affair, it will be treated as one's interests dictate, and not with the spirit of fairness which it ought to have.

Senator Stewart, of Nevada, has sent us a copy of his speech on the subject, delivered before the U. S. Senate on the 3d ult. It is certainly a most able argument, and advocates the distribution of land in small quantities. It likewise advocates the railroad grant system with ability. With this we also agree—to a certain extent. But to give the railroads unlimited amounts, is contrary to our ideas. Give them enough to aid them and to secure the construction of roads, but be judicious and careful in such gifts. We append a few extracts from the senator's speech, as follows:

I believe I have alluded in a general way to all legislation under which any considerable portion of the public domain has been alienated. Thus it will be seen that the sales of the public lands have been to pre-emptors, purchasers at auction, and purchasers at private entry; and that the donations of public lands have been to

States for purposes of education, to States and corporations in aid of internal improvements, and to individuals for military service, for homesteads, and to discharge supposed obligations to Indians.

Land Sales and Grants.

A recapitulation shows the following disposition of the public domain thus far appropriated for all purposes by the General Government. In this estimate no allowance has been made for mineral lands or desert county.

	Acres.
Sales for cash to actual settlers.....	80,294,000
Sales for cash to all other persons.....	80,294,000
Total cash sales.....	160,588,000
Donations to individuals:	
For military services and not assigned.....	8,000,000
For military services, and assigned to others.....	70,000,000
To individuals, being half-breed scrip, and assigned to others unlawfully.....	715,652
To homestead settlers.....	15,900,730
To States:	
Swamp and overflowed lands.....	60,000,000
Agricultural college grants.....	9,510,000
Sixteenth and thirty-sixth sections for schools.....	9,066,802
To aid internal improvements, but in some cases diverted to school purposes.....	13,669,671
To railroads:	
In States.....	50,000,000
Transcontinental and branches.....	30,000,000

Total donations..... 330,8 2,855
Aggregate sales and donations..... 491,450,855

Thus it will be seen that of the 491,450,855 acres of lands appropriated by the Government, actual settlers have received by purchase under the pre-emption laws, and by gift under the homestead act, 96,194,730 acres, or less than one acre in five of the whole amount.

If we omit the railroad grants above stated, namely, 89,000,000 acres, we find that the remainder of the land disposed of, namely, 306,256,125 acres, have gone into the hands of States and individuals, the latter having no other interest than to obtain the largest price, and the former prone, as we all know, to almost immediately surrender their grants to the speculators and adventurers who have been able to control the local legislation.

Monopolists vs. Railroads.

The senator speaks of how the people who should be benefited, have been injured for the benefit of monopolists, and alludes to fraudulent entries and sales. He shows the beneficial results of the railroad grant system. This public land must first be reached by steam communication before they will be settled up; the only way of furnishing the communication is by building railroads which must aid. Settlers prefer half the quantity of land when near railroads, which, being obliged to sell their lands for money to build the roads and pay interest on their bonds; being compelled to take the land as it comes, the good with the bad, without selecting it; being necessitated to have settlers along their lines to furnish business; are thus, in fact, great colonization societies.

The amount of public lands unsold and unappropriated on June 30, 1870, exclusive of Alaska, was 1,018,202,609 acres, from which should be deducted the grant to the Texas Pacific road, made at the last session, 21,000,000 acres. Balance of public domain now unappropriated, 997,202,609 acres. It would not be safe to estimate the portion of this land fit for cultivation at more than one-third of the whole. This would leave of public lands suitable for homes yet unsold and unappropriated 332,400,869 acres, the best portions of which are reserved for Indians. The other two-thirds are either grazing or mining lands or desert.

ACCLIMATIZING SOCIETY.—The Ornithological Piscatorial Acclimatizing Society, at its meeting last week decided to incorporate under the name of the Acclimatizing Society with a capital stock of \$50,000 divided into \$5,000 shares. The trustees are Dr. W. A. Newell, M. M. Estee, S. B. Clark, John K. Orr, D. J. Mills, J. B. Green, E. H. Keill, C. Stiver, P. D. Horton, A. Cadlam, J. Williamson and J. C. Green. Mr. Estee said the incorporation of the Society would harmonize with the law, and give it a standing which it should have to fill its mission. It was the view of the Society also to get a law passed by the next Legislature giving the Society control of the public streams and ponds in the State, where it would not be in conflict with the rights of private citizens. By incorporating, gentlemen in the rural districts could be got to take stock; men of leisure and means who can assist the Society and be assisted in propagating fish and game on the coast.

OUTRAGES IN THE SOUTHERN STATES.—Senator Cole sends us the report of the Senate Committee appointed to investigate the alleged outrages in the Southern States.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SHUT DOWN.—*Chronicle*, April 22d: The Globe has stopped work. We cannot reconcile this proceeding with the statements in regard to the fabulous wealth of this mine. Is this going to be another specimen of sagacity and enterprise—putting up a mill before you get a mine?

SCHENECTADY.—By to-day's stage, M. Schwerin, Supt., returns to New York, to report to his company and make arrangements for erecting reduction works.

The *Miner* of same date says: Another strike was made in the Schenectady this week. The main lower tunnel has been pushed ahead from the point where the drift to connect the upper and lower works by winze leaves it, and ore of better character than ever before found in the mine penetrated some distance.

AMADOR COUNTY.

THE KENNEDY.—*Dispatch*, April 29th: The whistle of the mill, last Monday, conveyed the welcome intelligence that that institution was at last ready to commence crushing quartz.

The *Ledger* of 29th says the mill has been put in complete order and everything works to a charm. The engine is in charge of two experienced engineers.

GOING TO WORK.—We learn that a contract has been entered into to sink the Casco mine two hundred feet deeper, and work will at once be commenced.

CALAVERAS COUNTY.

RAILROAD FLAT.—*Chronicle*, April 29th: Sanderson & Co. are hauling rock to the Randolph mill. Fiffeld & Co. also. Business is improving. From present appearances the miners are taking out more rock than at any former time. It is rumored that parties contemplate starting the Petticoat mill, on custom rock.

WHAT CHEER.—The erection of machinery upon this mine will be commenced next week. The timber is being hauled.

SHEEP'S RANCH QUARTZ.—Mr. W. I. Armstrong, proprietor of the principal mill, has just finished crushing fifty tons of rock from the mine of Wallace & Armstrong, which yielded \$3,000—an average of \$60 per ton. The quartz was unassorted. The entire lead was taken out and everything put through the battery. . . . Thirteen tons of rock from the "Lodi," worked in Armstrong's mill, netted \$150 per ton. . . . The Jaquith mine, on Indian Creek, has been sold to a company of San Francisco capitalists for \$40,000. One ton of rock from this lead worked in Bovee's mill at Angels, yielded \$51. The parties who purchased have made arrangements for the erection of a twenty-stamp mill. Three hundred tons of rock are in readiness for crushing. . . . Samuel Woods has worked forty tons of ore from his mine which paid \$82 per ton. Mr. Woods has plenty more of the same in sight. . . . W. Bean & Co's mill is kept in constant operation on first-class rock, the average yield per ton being \$40. G. Rodeseino, proprietor of the "Rose Hill" mine near El Dorado, has a shaft sunk eighty feet, at which point the lead shows four to six feet in width. The rock is very rich.

ELDORADO COUNTY.

POCAHONTAS.—Cor. of *Placerville Democrat*, April 29th: This mine for the last year has not failed in declaring a handsome monthly dividend. The new shaft is 250 feet deep, shielded on top by a building that shades a 20-horse power engine, with a hoiler of corresponding capacity. Considerable improvements are constantly taking place—miners' cabins and family residences dot the surface in all directions.

N. Y. & EL DORADO.—This company have an excellent 10-stamp mill, with boiler and engine sufficient to run 30 more. A gradually rising knoll, some hundred yards distant from the mill, is topped by the finest hoisting rig in the county. The shaft is 240 feet below the surface, well timbered, five hy eight in the clear, with a ledge twenty inches in thickness. Their last run paid \$10 per ton, but the rock is improving rapidly.

NASHVILLE.—Here is the Havilah, a No. one 40-stamp mill, that pulverizes 250 tons weekly, employing forty to a hundred men. The ledge averages five feet thick. The Montezuma, too, is located here; but for reasons best known to the company, they have permitted their 20 stamps and good mine to remain idle for the last two years.

INYO COUNTY.

ECLIPSE MILL.—*Independent*, April 22d: Last Tuesday the air-stamp battery was started up for the first time, and a considerable lot of rock run through. Its effectiveness was demonstrated to the complete satisfaction of all present. The stamps operate at the speed of 150 drops per minute, dropping 19 inches, and on the trial reduced 42 tons per day. The mill was started up yesterday for a continuous run.

CERRO GORNO.—Cor. of same: The Industry tunnel, near the Lucas mine, is in a distance of 160 feet, the company commencing the 18th of February. The present indications are favorable of striking ore soon. The Oceola tunnel has struck the ledge at last. The Wittekind is progressing favorably, expecting to reach the mine within two or three weeks. The Friendship is doing well. The Belmont has maintained her reputation. George Mendez & Co. have struck a large deposit of ore in the drift of the San Felipe tunnel, 50 feet from the tunnel, and 30 feet below the level of the same.

MARIPOSA COUNTY.

The *Gazette* of April 28th says that the work of cleaning out and retimbering the main shaft at the Washington mine, which caved in several weeks since, is progressing. The shaft is opened to a depth of nearly 300 feet, and if no accident happens the company expect to have the mine in working order by the middle of May.

MONO COUNTY.

DUNDERBERG.—*Carson Register*, April 23d: A dispatch from Dr. Munckton states that he had arrived at Washington City, made arrangements for working the Dunderberg mine on an extensive scale, and was to leave for New York yesterday.

NEVADA COUNTY.

GRANITEVILLE.—Cor. of *Gazette*, April 27th: Morris, Mitchell & Co., at the South Fork, have free water almost the entire year, have their claims fitted up in first-rate shape, and I am informed that they pay on the average about \$10 per day to the man. It is valuable property, as they have ground enough, at the present rate of working, to last 20 years. Baldwin & Co. at the head of little Canyon creek, commenced running water last week. They have rich ground. The great difficulty is a scarcity of water. They work about five months in a year, and make ten to fifteen dollars per day to the man. Robertson's diggings are in what is known as "God's country." He has commenced piping, and his ground prospects well. Moore & Staples located ground on Portuguese flat, half a mile from town, and the ground is paying handsomely. Mr. Hibbert and partner are working ground at Rocky Glen. On Madman's flat, Hughes & Co. claims, which in early days paid richly, are now drifting, and making good wages. O'Garra's claims, also on this flat, are yielding good returns.

WEBSTER MINE.—*Grass Valley Union*, May 2d: On Saturday the men took out gaavel for ten hours. This was washed and yielded gold 24½ ounces, worth \$18 an ounce, making in all \$441. The clean up yesterday was about \$2,000. Yesterday morning two ounces of gold was taken from one pan.

PLACER COUNTY.

ST. PATRICK MINE.—*Herald*, April 29th: A box of quartz showing free gold and sulphurets in abundance, taken from different levels in the St. Patrick shaft from 125 to 200 feet deep, was brought to town on Thursday. It is a marvel of richness. It weighed 180 pounds and was estimated to contain fully \$1,000 in free gold. The Co. now has an east drift 80 feet from the 200 foot level, and the ledge on this drift shows from four to five feet thick of this rich ore. The mine we believe has not a parallel on this coast for the time it has been opened and the work done, in richness, if we except the Greene ledge.

DILLON MINE.—We referred to the rich crushing of over \$70 per ton last week. Since then the owners, Dillon, Cowan and Himes, have purchased the hoisting works formerly used on the St. Patrick, and a Cornish pump, all to be run by water power. The shaft thirty-five feet deep, is now full of water to within two feet of the top, but the boys think they will have their works in place, and the shaft dry in three weeks. The ledge at the bottom of the shaft is three feet thick and well defined.

Chas. Gardiner plowed up a five dollar specimen the other day on the old Turner place.

PLUMAS COUNTY.

ITEMS.—*Quincy National*, April 22d: The Eureka Co. has started 16 stamps, and is making an average clean-up of \$1,000 per day. The Co. has nearly one hundred men employed, and the mine is looking splendidly. . . . Morris Smith & Bro., of Badger Hill,

made a clean-up of a few sluices in one of their side flumes, one day last week, and took out \$800. . . . North American Co., at Whisky Diggings' lately commenced washing up, and estimate the season's work at \$50,000. . . . The miners are working long hours, so as not to lose the benefit of the water season, which in some localities will be short, and they do not take time to clean up. . . . The frost is over at Mill Creek and the miners are again at work. . . . As the creek heads in the high mountains, the prospect for a long run of water this season is good.

SAN BERNARDINO COUNTY.

RICH ORE.—*Guardian*, April 29th: John McFarland brought in from the Clarke District, this week, three or four tons of immensely rich silver ore which will leave on the next steamer for San Francisco. This ore assays per ton, from six to seventeen thousand dollars.

SAN DIEGO COUNTY.

BULLION.—*Union*, April 27th: Pauly & Sons shipped per Wm. Taber yesterday about \$1,000, gold bullion, from the Julian mines.

SIERRA COUNTY.

MINING SALE.—*Democrat*, April 27th: Messrs. Wehe, Barton & Hibbert have sold the Telegraph Ledge to Robinson & Co., San Francisco capitalists.

ITEMS.—*Messenger*, April 29th: The Keystone Co. cleaned up on Tuesday last after a run of forty days with twelve stamps, 95 pounds and 8 ounces of gold, worth \$19 per ounce—nearly \$22,000. We are informed that the Keystone intends to build a new mill this summer. . . . The owners of the mines on Craycroft hill, commenced piping on Tuesday. . . . Adelaide ledge is being prospected with flattering results. . . . The rock from Homestake ledge is very rich in free gold. A shaft is down 42 feet, and it has been prospected for 900 feet. A contract has been let to run 150 feet of tunnel.

PORT WINE.—Cor. of same: The Union Co., have come to the second pitch, and it is paying better than ever. . . . The Monte Cristo is doing first-rate. I saw a specimen yesterday, which weighed 22 ounces, and was told there was at least six ounces of gold in it. . . . The Eagle boys have washed up, with fair results. . . . The Pioneer, at Grass Flat, is driving its tunnel ahead. Pay dirt has been struck. . . . The Queen boys look as though they had found some of this metal they have worked for. . . . The boys at French tunnel are doing a fair thing.

SISKIYOU COUNTY.

PROSPECTING.—*Yreka Union*, April 26th: We learn from Hot Spring Valley, that there are a great number of parties through that country prospecting. One party got prospects of free gold in quartz, everywhere on a range north from the Ehlers & Co's claim.

TRINITY COUNTY.

LEWISTON.—*Journal*, April 29th: Mr. O. Phillips has struck it the biggest kind. The hill back of Lewiston has been worked for many years. On one portion, as was supposed, it had been sluiced away down to the bed-rock at an early day. Upon trial, however, it appears that the supposed bed-rock was simply hard sand, twelve inches thick. Underneath this layer Mr. Phillips has found six to eight feet of gravel, yielding from five cents in the hank to \$1.50 on the bed-rock to the pan. From holes sunk in different places through the false bed-rock, Mr. Phillips has tested two acres of the same soil.

At Junction City, the miners are all at work, and gold dust in coming is at a lively rate.

Nevada.

ELY DISTRICT.

BULLION.—*Record*, April 23d: Wells, Fargo & Co., shipped yesterday by way of Salt Lake, 11 bars, valued at \$12,554.37. Same of the 27th says: W. F. & Co. shipped yesterday by way of Salt Lake, 5 bars of bullion for the M. V. Co., valued at \$6,600.88; for Barnum W. Field, bullion valued \$5,167.61.

MEADOW VALLEY CO.—Wagons can now be loaded with the greatest facility at nearly all the mines of the company; all are accessible to teams by roads of easy grade. Three new hoilers 56 inches in diameter, 16 feet long, of 42 3/4 inch tubes each, have just arrived and two are being placed in position. The other is held in reserve against emergency. The Co. are taking down their old smelting furnace, erected two years since. The brick are to be used in the mill at the Valley.

The Chicago mill will start up on Friday—having been leased by Hanchet and others. The erection of a Stetefeldt furnace, will be commenced immediately.

EUREKA DISTRICT.

EUREKA CONSOLIDATED CO.—*Sentinel*, April 29th: The Co.'s mines look as well as ever. There are two 10 horse teams hauling ore from the mines, on Ruby Hill, two miles from the furnaces. They make each two trips daily, hauling at each load 28,000 pounds of ore per team, making a total of 56 tons. After the first of May, when the new furnaces will be running, two more teams will be put on the road, and then there will be hauled daily not less than 112 tons of ore.

The Wellington mine on Adam's Hill, north of the Phoenix Co.'s Lexington and Empire, is opening up handsomely. This shaft, though but eight feet deep, and eight feet square, shows ore on every side.

The Nourmahal mine on Adams Hill, next east from the General Lee promises well, assaying as high as \$282.

ROSLIN CO.—For months this furnace has been turning out hullion on an average of four tons per day, which is worth, in silver and gold, \$350 per ton. There is now at the furnace sixty tons of this hullion awaiting shipment to Selby & Co. at San Francisco. The mines from which the ore has been obtained, are the Elise, Hamburg, Helen Mortimer, Diligence, and Sterling. Assays have been made from the Elise of \$10,270 per ton, and the average of hundreds of tons has been \$270. This average width of the ore is eight feet, and this at a depth of 102 feet. A tunnel is now in 110 feet on the Sterling and Diligence. This company also has a 200-foot tunnel in the Helen Mortimer hill, and are now running on a ledge three feet wide. Every mine of the Co. is producing good ore, and will yield more than half a dozen such furnaces can smelt.

E. MERALDA.

WALKER RIVER.—The *Enterprise* of April 27th says that Messrs. Kennedy and Hurd have discovered an immense ledge 30 miles west of Walker Lake and 65 miles from Virginia City. The ledge is 40 feet wide, and has been traced 3,000 feet. The proprietors sunk a 20-foot shaft, and run a cross-cut, the ore from which assays from \$50 to \$1,900 per ton. They have named lead the "Gruthi."

HUMBOLDT.

ECLIPSE MINE.—*Silver State*, April 29th: The tunnel is now in 120 feet, through frequent spurs of quartz. The main ledges is near at hand. The cutting of this vein is anxiously looked for.

BULLION SHIPMENT.—The amount of hullion shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$6,399.35.

BATTLE MOUNTAIN.—Cor. of *Register*, April 29th: The Nevada Butte mill is to be finished by June 15th. The Little Giant mine has been sold to Mr. Gashwiler, of San Francisco. The Trenton has been sold to Judge Goodwin, of Eureka, for \$75,000. The ore from the White mine is as rich as ever. Not much taken out this week on account of water. It is rumored that machinery is to be placed on the Buena Vista. The Black Hawk tunnel is in 45 feet, and the shaft down 15 feet. The Brooklyn will ship 30 tons of rich galena soon. Wire silver has been struck in the Daisy.

ITEMS.—Ed. Rinkel and Ham Sherer, prospecting in Central district, discovered a ledge two feet thick, which yields \$100 to the ton in gold. . . . Pride of the Mountain will ship ore to Rye Patch mill soon. . . . L. D. Webb, of Gold Run district, shipped last week to the Rye Patch mill 18 tons of ore from the Second South Extension of the Golconda mine, which yielded \$75 per ton.

REESE RIVER.

SILVER PEAK.—*Reveille*, April 24th: The Lodi is turning out rich. Two cuts, one 60 and the other 40 feet, disclosed a continuous vein averaging four feet in thickness which will mill not less than \$150 per ton in gold and silver.

WASHOE.

GOUTIN AND CURRY.—*Enterprise*, April 30th:—The work of retimbering the upper portion of the main shaft is nearly completed. The bottom of the shaft is now in metal-bearing quartzose material, indicative, in the opinion of experts, of the immediate proximity of a heavy body of valuable ore.

SAVAGE.—The average daily quantity of ore mined is 110 tons.

HALE AND NORCROSS.—The regular daily quantity of ore is extracted, the principal yield being from the eighth or deepest level.

OPHIR.—The cross cut from the "uprise" in the south mine has passed through the vein matter to the west clay. A drift is being run northward in search of ore.

CONSOLIDATED VIRGINIA.—The north drift from the main west drift was in yesterday 278 feet and is now in very hard rock containing occasional spots of ore.

CHOLLAR-POTOSI.—During the past week there have been extracted 1,800 tons of ore, and 1,740 tons has been sent to the mills. The average assay per ton has been \$8.20. The amount of bullion shipped for the week was \$80,000.

YELLOW JACKET.—The mine is yielding 180 tons of ore per day, from between the 800 and 1,000-foot levels. An incline is about being commenced from the bottom of the main shaft, at the 1,100 foot level.

CROWN POINT.—The immense body of paying ore improves in every direction. They are now taking out 160 tons of ore per day on the average. The ore, unassorted, averages \$35 per ton.

OVERMAN.—This Co. are taking out forty tons of ore per day through the tunnel connected with the 226-foot level. At the hoisting works, the pump machinery only is running.

SIERRA NEVADA.—The mine and mill are both lying idle owing to legal troubles with the Kenosha Co. Some ore is being taken out of the Sacramento and Meredith mine by contract.

LADY BRYAN.—A force of forty men are at work. Workmen are quarrying ore from the croppings, which it is believed will pay well. The pumping machinery was started yesterday and works well.

DANEY.—Good progress with the drift west for the lead. They will shortly begin taking out low-grade ore from near the surface in the old works.

SUTRO TUNNEL.—The tunnel was yesterday in 1,929 feet. The working force will be increased Monday.

OLD MINES.—Some of the 1860 claims among the hills east of Carson City are being relocated. A 12-foot lead, yielding \$35 per ton, near the "Hatfield" mine, has been found. It was abandoned when it cost nearly that figure to crush rock. Now it will pay.

TALINO'S MILL.—Parke & Bowie's mill, in Six-mile Cañon, contains six iron pans 7½ ft. in diameter and six ft. deep, capable of working six tons of tailings at a charge, and six charges in 24 hours, and six wooden settlers, 10 feet in diameter and 7 feet deep. The mill works 100 to 120 tons per day.

WHITE PINE.

REVIEW.—*News*, April 29th: All the mines are working an increased force. The body of ore in the Original Hidden Treasure, proved to be very extensive. The tramway wire was started on Wednesday, and ran well about 100 feet. It is a success; all that is lacking is a little more power, which will probably be supplied during the coming week. Several important sales have been made during the week. The bullion shipments have been 15 bars, valued at \$16,080.53.

ITEMS.—Lower tunnel in O. H. Treasure passes for the entire 300 feet through fair milling ore. Silver Wave is taking out 20 tons daily, 15 of which is milled, and averages \$100 per ton. Shaft in Ward Beecher Consolidated is down 70 feet. Good ore found in the Ieeberg. Three men taking out 75 pounds daily of Mazepa ore, worth \$1,000 per ton. The rest of the one ton raised will mill \$60 to \$150. Of the basement mines, the Caroline uses an astrara, and turns out a good-sized brick weekly. Lucky Boy raises its regular ton of good ore daily. In C. T. Fay, the high grade ore is still being followed with no signs of giving out. The vein increases in size. Bismuth's tunnel is in 80 feet, and struck good ore. Since the sale of the Page & Corwin mine, enough ore has been taken out to repay the purchase money, and plenty left in sight. The 10-stamp mill at Tem Pute turns out bullion of high fineness. Stanford mill was to start May 1st. The Monte Cristo 20-stamp mill will be completed within the specified time. Metropolitan runs steadily.

Arizona.

BRANSHAW.—Prescott *Miner*, April 22d: Moreland & Co., owners of discovery location on the Tiger, had their four-foot shaft down 17 feet, and had struck water. Rock richer than ever. Rich pay streak wider than shaft. Owners in ecstasies. The same Co. were running cut, and had waded through 18 feet of good paying ore. Riggs & Co., south of discovery, on Tiger, although they had worked through and across 20 feet of quartz, had not cut through the entire ledge. Rock as rich as they cared to have it. The men at work on Bean & Co.'s location, south Tiger, were surrounded by rich rock, and felt happy. Their cut was in on the ledge 20 feet; down upon it 15 feet, and the ledge was fully 12 feet thick.

HASSAYAMPA.—The rich streak on the Davis lode, that will pay \$100 per ton, is fully 4½ feet thick. The remainder will pay for working. Mill ordered from San Francisco.

Colorado.

GEORGETOWN.—*Miner*, April 27th: The heading of the Burleigh tunnel is 33 feet beyond the lode cut. The mills are fully supplied with ore. The Dunedin is producing fine specimens of native silver. Work has been commenced on the Bismark lode. Mr. Bemont, of the Washington Mill, shipped last week five tons of ore from the Stevens mine. The ore was crushed, sampled and assayed, and assays showed 175 ozs. of silver and 60 per cent. (1,200 lbs.) per ton of lead. Palmer & Nichols of the German Reduction Works, have shipped since our last issue 3,378 ozs. value \$3,702, coin. The Stewart Co. have shipped \$3,233 bullion. They purchased one ton of ore from the Munsell lode for which they gave \$521 currency, and a lot from the Anetula lode, which gave \$786 coin, to the ton by assay. We saw last week some Caribou ore worth \$2,000 per ton. Mr. Geo. Chase will commence immediately to develop those claims of the Phoenix Co. which are situated in Trail Run. Mr. M. Thatcher is driving work on the Napoleon lode, Columbian mountain. The rock struck assays \$1,461.20 per ton. We have it from good authority that the gold yield for this county was underestimated in the bullion report for 1870. It should be \$65,000 instead of \$30,000.

ITEMS.—*Herald*, April 22d: Two stamp mills in Black Hawk that have lain idle all winter, started up last week on custom ores. These are the Consolidated Gregory, 25 stamps, and the Woodbury & Norton, 23 stamps. Cash & Rockwell's chlorination establishment has more than it can do in the way of treating the higher grade ores. These works are beside the Continental Co.'s mill, in Chase gulch, one mile above Black Hawk. Martin & Peters are running pans on ores and tailings at the Dickinson mill with great success. They have lately doubled their pan capacity, but still have more work offered them than they can attend to.

CARIBOU.—Same of 8th April says that there is three feet of solid ore at the bottom of the shaft. A single piece worth \$300 in native silver was taken out.

Idaho.

ITEMS.—*Avalanche*, April 22d: Owners of placer mines are waiting for water, and in a few more warm days mining will be in full blast. The yield of gold dust will be greater this season than for years. Parties are getting ready to work the Golden Chariot dump, and Frazer & Co. have everything in readiness for commencing operations on the dump of the Ida Elmore. The Bruce Bros. are making a string of sluice boxes, and, as soon as the water starts, will resume work on the Oro Fino dump. Mr. Black will soon start up his mill on Pioneer ore. C. S. Miller is about starting the Rising Star mill. Wells, Fargo & Co. shipped from here during the past week 8 bars of bullion, valued at \$21,730.06.

SNAKE RIVER.—*Democrat*, April 26th: At the bank of Greathouse Bros. on Monday, we saw 70 ounces of gold dust just brought in from the Snake River mines and worth \$17 per ounce.

SOUTH BOISE.—The London (England) *Standard* gives the particulars of the incorporation of the "Atlantic Silver Mining Company (Limited)" to purchase and work the Atlanta and other mines. The capital stock is £250,000. The figuring estimates a clear profit, the first year, of 54 per cent. on the money invested.

Montana.

MINING.—*New North West*, April 21st: Nearly all the camps would have been working this week, had not the cold snap checked up water. Blackfoot, Bear, Elk, Henderson, Gold Creek, Pilgrim Bar, Silver Bow and Butte will be actively mined next week, if the weather holds fair. There is only one opinion—that 1871 will be the most productive mining season ever seen in Deer Lodge.

ITEMS.—*Independent*, April 22d:—Claim No. 40, upper district, Quartz Gulch, gave \$150. to a set of timbers. A gentleman from Argenta says Stapleton is running his furnace with profit. The company that own the Rattlesnake Ditch are working on the bars and small gulches and doing well. In Elk Creek, Messrs. McGovern, Hyland & Co., Dugan & Co., Wm. Kenedy & Co., and Jones & Co., began operations last Monday, and Stone & Co., intend to start up next Monday. There is an abundance of snow on the mountains. Joel Catching turned three pipes on his gravel bank on Pilgrim Bar to-day. Several other companies will commence panning during the week. John Brown, of Pioneer City, has sold a one-third interest in the Brown & Kelley claim on Gold Hill, to Col. Thornton for \$3,000.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., May 4.

The stock market has been active but irregular during the past week. Crown Point and Belcher have both reached their highest point for years. Amador has been quoted at \$345 to \$360, quite a fall from the preceding quotations.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock:

Alpha	Apr 29	Highest	Lowest	May 4	Adv.	Dec.
Alpha	10	10	10	10	—	—

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 18TH.

AMALGAMATING PAN FOR GOLD AND SILVER ORES.—Ira S. Parke, Virginia City, Nevada.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

METALLIC WHEEL.—J. H. Harris, S. F. This improvement in metallic wheels consists in making the wheel with sheet or plate iron sides, which extend from the hub to the rim, leaving a hollow space between them, thus forming a metallic box wheel suitable more particularly for use as bearing wheels for gang plows, and presenting the advantage of having no spokes or projecting parts to gather mud or dirt, but scouring and freeing itself continually. For the proper construction of this wheel, a tire and a hub of peculiar make are required, which comprise part of the invention. The advantage of the device will be felt in moving over loose or wet land, but more especially where the ground is a stiff adobe, as in California. The wheel is strong and durable and can be easily and cheaply constructed.

ROLLER SKATE.—D. Kerr and A. E. Hovey, S. F. The skating mania having spread throughout the land, one naturally sees new improvements in this device which renders the exercise possible, and examines them with interest. The present invention relates to 4-wheel roller skates, such as are constructed to turn from side to side in curves by tilting the skate block with the foot or shifting the weight of the skater to either foot. It consists in providing a plate to serve as a bearing for the journal which turns in the foot block, this having a lug or projection on it, and serving to prevent the displacement of the truck in which the wheels revolve and to relieve the strain on the bearings. It also consists in an improved method of seating the rubber block or spring upon the foot block, so that it can be more or less compressed as desired; and also in the etaudard which bears upon the block, and by means of which the trucks are held in position.

TELEGRAPH SOUNDER KEY.—J. Gamble, S. F. This is a very neat device by which the hand can be taught the proper motion for writing with the signal key, and the ear rendered familiar with the telegraphic sounds or clicks, without the necessity of having a battery. It is convenient, neat and cheap, and is coming largely into favor among those desiring of learning to operate.

THE HEALTHIEST COUNTRY IN THE WORLD. De Bow's mortality statistics show that the people of the United States are the healthiest of the globe. The deaths are three hundred and twenty thousand per year, or one and one-third per cent. of the population.—In England the ratio is over two per cent. and in France nearly three per cent. Virginia and North Carolina are the healthiest of the States, and have 638 inhabitants over 100 years of age.

LEWIS RIVER.—We learn that recently a dozen or more families have gone into the Lewis river neighborhood for the purpose of procuring farms and to settle. The prospect of the Northern Pacific Railroad being completed through this region within the next two or three years, is having a very stimulating effect in settling up the hitherto unoccupied land along the north bank of the Columbia and along its tributaries.—*Oregonian*.

SORROW comes soon enough without despondency; it does a man no good to carry around a lightning rod to attract trouble.

Refining Gold by Chlorine Gas.

We have spoken several times of this process, which, after being successively and successfully introduced in Australia and England, is now being tried at the Philadelphia mint. Some time ago, a description of the mode of operation which had been found most advantageous in practice, was described in the *Chemical News*, and this we now reproduce.

The French crucibles (say, size 17 or 18), duly prepared with borax, having been placed in the cold furnace, and slowly and carefully heated to dull redness, the gold (from 600 to 700 ounces to each crucible) is introduced, and the fire urged until the metal is melted, the necessary generation of chlorine having meantime been commenced by the introduction of a little hydrochloric acid, poured down the safety-tube, into the generators.

In order to fill the pots, and avoid the risk of splitting them by the wedging of the ingots at their contracted bottom, the gold for refining is cast in molds of a peculiar form. Two inches, from end to end, the sides and bottom of the iron ingot molds converge so as to produce a slipper shaped ingot, two of which, placed face to face, fit conveniently into the pot.

As soon as the gold is melted, from two to three ounces of borax, in a state of fusion, is poured upon its surface. If the borax is added sooner, it acts too much on the lower part of the pot; and if thrown in cold, is apt to chill the gold. The clay-pipe which is to convey the chlorine to the bottom of the melted gold is now introduced. (It is necessary to carefully heat the lower portion of this pipe for some ten minutes before introducing it into the molten gold, or it is apt to split.) At the moment of its entering the melted gold, the screw compression clamp is slightly loosened, so as to allow a small quantity of gas to pass through it, and thus prevent any metal rising and setting in the pipe, which is then gradually lowered to the bottom of the molten gold, where it is kept by means of a few small weights attached to the top. The compression-tap is now quite relaxed, and the gas is heard bubbling up through the melted metal, which it does quietly and without projection of globules from the pot.

Sufficient hydrochloric acid must be added to the generators, from time to time, to keep up a rapid evolution of chlorine. A rough general rule is to allow 1 imperial quart of acid of 1.15 specific gravity to every 10 ounces of silver in the alloy operated on. The column of liquid in the safety-tube, acting, as it does, like a barometer, affords a ready means of knowing the pressure in the generator, and of judging of the rate of production of the gas, as well as at once showing, by its fall, if anything irregular has occurred—such as a leak or crack of the chlorine pipe or pot. From 16 to 18 inches in the safety-tube correspond to and balance 1 inch of gold in the refining crucible. When the chlorine is first introduced into the melted gold, a quantity of fumes are seen to pass up from the holes in the crucible-lid; these are not chloride of silver, but the volatile chlorides of some of the baser metals, and they are especially dense when much lead is present in the alloy under treatment, forming a white deposit on any cold substance presented to them. After a time, longer or shorter, according to the impurities in the gold, these fumes cease. So long as any decided quantity of silver is present in the molten gold, the whole, or nearly the whole, of the chlorine is absorbed, little, if any, appearing to escape, and to be thus wasted; and it is found that the better the supply of chlorine the quicker is the operation.

It is a curious circumstance that, though in toughening with corrosive sublimate, this substance is only thrown on the surface of the melted gold, yet the whole mass is toughened by its action. It seems essential, in using chlorine, that the gas should pass to the very bottom to effect a complete refining.

As soon as the operation is nearly over, fumes of a darker color than those observed at the commencement make their appearance; and the end of the refining is indicated by a peculiar flame or luminous vapor of a brownish yellow color (occasioned by the free and now waste chlorine escaping), which can be seen on removing a small plug which fits into a hole in the lid of the pot. This, however, of itself, is not a sufficient indication; the process is not complete until the flame imparts to a piece of white tobacco-pipe, or similar substance, when held in it for a moment, a peculiar reddish or brownish yellow stain; so long

as it gives any other color, the refining is unfinished.

When these appearances are observed (usually for gold containing about 10 per cent. of silver in about an hour and a half from the introduction of the chlorine), the gas is shut off, and the pots removed from the fire, the white crucible lifted out of the black one, and, together with its contents, allowed to stand seven minutes, until the gold becomes cool enough to set or solidify. The chloride of silver, which remains liquid much longer, is then poured off into iron molds. The crucible is then inverted on an iron table, when the still red-hot gold falls out in the shape of a cone; this is slightly scraped, and thrown, hissing, into a concentrated solution of common salt, to free it from any adherent chloride of silver.

An alloy containing originally 89 per cent. of silver, and 1 per cent. of base metals, will yield, on an average, a cake of chloride weighing, with a little adherent borax, 16 ounces for every 100 ounces operated on.

It is necessary very carefully to dry and heat the molds into which the chloride of silver is poured, as the slightest moisture causes the latter to be violently dispersed while red-hot, to the great risk of the bystanders. With ordinary care, this will never happen; but attention is called to the point, as a very deliquescent chloride of iron is apt to form on the molds.

The gold is now fine, and simply requires remelting into ingots.

As before stated, it is found that all these operations can readily be performed, and about 2,000 ounces refined per day in three common melting furnaces, between 9 A. M. and 2 P. M.; 98 per cent. of the gold originally contained in the alloy operated on is then ready for delivery.

The other 2 per cent. remains with the chloride of silver, partially in the metallic state, and partly in a state of combination with chlorine, and probably silver.

To free the chloride of silver from this combined gold (that mechanically mixed being eliminated at the same time), it is melted in a boraxed white pot, with the addition of from 8 to 10 per cent. of metallic silver, rolled to about $\frac{1}{4}$ inch thickness. The chloride of gold is, by this means, reduced at the expense of the metallic silver, chloride of silver being formed; while the liberated gold sinks, and melts into a button at the bottom of the pot. As soon as the whole is thoroughly melted, the pot is removed from the furnace, and allowed to stand about ten minutes; and the still liquid chlorides of silver is then poured into large iron molds, so as to form slabs of a convenient thickness for the next operation, that is, its reduction to the metallic state.

After the fusion of the chlorides, a small quantity of a curious spongy substance adheres to the sides of the crucible used, probably consisting of subchloride of silver; but since it always contains a little gold, care has to be taken in pouring off the fluid chlorides, to prevent this auriferous sponge from falling out and mixing with them.

The fusion of the chlorides with metallic silver does not remove every trace of gold; but, with proper care, the amount remaining in the silver produced need not exceed 3 parts in 10,000, or about 2 grains of gold in ever pound (troy) of silver—a quantity too small to pay for further extraction in this colony.

The slabs of chloride of silver are reduced without difficulty by plates of wrought iron or zinc, in the usual way; but my friend and colleague, Dr. Leibius, has contrived a very excellent apparatus for this purpose.

[To be continued.]

Hidden Life.

Every drop of water teems with life. You cannot quench your thirst, even with the purest water, without swallowing scores of puny lives. The ocean is stirred by the huge leviathan, who maketh it to boil like a pot. And therein, also, in myriad varieties, are the lesser forms of life, running down to the animalcule, so small that one hundred and fifty millions of them weigh less than a grain!

The atmosphere is full of life, and the dry land swarms with animals of unwritten names and unknown orders. They inhabit the air we breathe, the water we drink, the food we eat. They move and have their being in sweets and sour—in the toughest flint, as well as in the mellow pulp of the peach—in blossoms and fruit, in buds and leaves, in roots and branches, in the bodies of animals; in our own human bodies are tiny tenants—populous colonies of little inhabitants, all too minute to be seen or comprehended. * * * * *

In an office, recently, we reached a hook from the shelf, and detected a speck of a

white insect hurrying off at a double-quick to hide behind a grain of dust—for we had opened on him by surprise. The little fellow was retreating rapidly,—for the shaking of a book-leaf, or even for as much of a leaf to tremble as would hold a single letter, was to him a commotion equal to a hundred earthquakes! But we pursued him, excited as he was, until we chased him on a bar of polished brass, and by a grand stratagem drove him to an entrenchment on the bar.

He was smaller than the dot of an *i* in your pocket Bible. But we pressed him into our service, a prisoner in his house of brass, and snugly covered by a glass slide, until we reviewed him beneath the microscope. His prison was less roomy than the eye of a fine cambric needle; yet, under the microscope, his liberties as well as his body were greatly enlarged. That creature, to the naked eye so small, was now, apparently, as large as a bee, and white as snow, with limbs of perfect symmetry and proportion. We were affected by his efforts to be free, he hurried from side to side of his prison-house, and tried to force the walls apart. Through his clear, transparent flesh could be seen the beatings of his heart, and the purple veins of his blood. His movements were restless and pitiful as those of a newly-caged bird. If we could, by some magnifier of sound, have heard his voice and understood his language, doubtless it would have been a plaintive cry for liberty.—*Journal of Microscopy*.

Dr. Mendenhall's Rain Theory.

EDS. PRESS:—I would like to ask some of your meteorological contributors why it is that the north wind, which occasionally sweeps across over the State with such damaging effect, is dry and hot, coming as it does from anywhere but a hot and dry country.

If not troubling you too much I would also like to make a remark in regard to an article in your issue of March 11th, about a Dr. Mendenhall acting upon a theory in his farming that as the rains are in Central America and Mexico, so they will be in California. A similar statement was published by the *Alta* in the fall of 1869 and a wet season predicted. I saw the same theory adverted to in the *Bulletin*, in the fall of 1870, and supposing it to be reliable, a very wet season was again announced.

In both years the theory has most completely failed. May we not have got the wrong end of the story—got the bull by the tail instead of the horns. We are taught that all our moisture rises under the equator and is carried north by regular trade winds; the evaporation is constant and regular. If through climatic changes of which we have no data the rainfall should be excessive in Central America and Mexico, would not our share be proportionally less; they receiving their share and part of ours? If their rainfall was light would we not be likely to get an over-dose. Yours respectfully, G. W. T. O. San Gregorio, April, 1871.

Successful Irrigation.

The Woodland Ditch Company are irrigating the grain fields along the line of their ditches, at the rate of five hundred acres a day. They had, up to the 22 inst., irrigated over five thousand acres of grain, and that to which the water was first applied was looking well and gave promise of a good yield. It is now believed that nearly all the grain irrigated by this company will produce a fair average crop. The same grain without such irrigation would have been an almost total failure. It is said that twenty-five thousand acres could have been irrigated by the ditches of this company, if they had commenced in season. The cost to the farms for the water is about \$4 per acre, and the grain will probably be worth from \$25 to \$30. It is believed by many that winter irrigation will pay even in all seasons. It is stated that the increase of grain even in wet seasons is at least 20 per cent. on land well irrigated in the fall or winter before sowing.

WHAT NEXT?—A "petrified whale" has been discovered in Los Angeles county, about 10 miles inland, near Aliso Springs. Petrified trees are at a discount.

POPULAR LECTURES.

The Latin we Speak.

[Prof. Martin Kellogg before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Fourth Series. Reported expressly for the PRESS.]

LECT. II. April 29.—Much has been said, remarked the lecturer, concerning the importance of the Anglo-Saxon element of our language, and of the necessity of its study. That it is important and ought to be studied, I fully agree; but this does not by any means imply that the classics ought to be neglected. Proper attention should be given to both. It is my province to-night, however, to speak of the connection of Latin with our speech, and to show how largely it enters into our every-day language.

The English language is indeed very composite. First, there is the Celtic element, then that derived from the Norseman, and the Danish. A very large proportion is from the Saxon, and the Norman invasion had a great influence. But long before the Norman conquest, Cæsar had over-run Great Britain, and Latin was engrafted on the stock. We have many French words, but French is only a daughter of the Latin. Latin and Greek are used largely in scientific terms. So it has come to pass that Latin and Greek form an important part of our language.

As I before said, I am to call your attention to-night principally to the Latin element. Now this is not confined, as some of you perhaps may have imagined, to the domain of high philosophy and abstruse thought. It is used largely here. But, as I hope to show you, it occurs also very largely in every-day speech, forms a familiar and indispensable part of our ordinary, work-a-day talk.

The lecturer proceeded to give many common examples of this. His examples were numerous, well-chosen, and often gave opportunity for quiet humor, which was appreciated by the audience, who were at first, however, a little puzzled by the supposed serious character of the lecture. We give a very few of the

Examples.

United States. United is from *unus*, one, through *unire*, *unitum*, to unite, make one. State is from *status*, standing, from *stare*, to stand. It means rank, condition, then people of a certain rank or condition, and then a body politic.

Sierra Nevada. Sierra comes from *serra*, a saw, from the resemblance of a chain or ridge of mountains to the teeth of a saw. Nevada is from *nivis*, snow. We get these through the Spanish.

Territory comes from *terra*, land, and means a tract of land. County comes from count, and meant originally the district belonging to a count. A count was a companion of an emperor, and the word comes from *comes*, companion, which is from *con* and *eo, ire*, to go with. The verb, to count, comes from a different source, from *computare*, to compute. Comptroller or controller, a person who examines and certifies accounts, is from this same word.

Senate comes from *senex*, an old man; representative from *re-presentare*, to place before, to present. Congress comes from *congredivere*, to come together. Capital is from *caput*, the head; it is the head or chief city.

Science is from *scientia*, from *scire*, *sciens*, to know. SCIENTIFIC is from *scientia*, science, and *facere*, to make; it means therefore to make to know. PRESS is from *pressare*, to squeeze, to press. *Alta* is from *altus*, high; the *Alta* might add as a motto to some of its editorials, *videt ut Alta stet*, you see how the *Alta* stands, [or *ut Alta stet*, how's that for high?] *Bulletin* is from *bulleta*, from *bulle*, an edict of the pope, and thence means a statement of facts, a public notice or announcement, especially of news recently received. *Call and Chronicle* come from the Greek, and you know the proverb, "when Greek meets Greek, then comes the tug of war." *Examiner* comes from *exagmen*, from *exigere*, to demand, exact. *News* is from *novus*, new. *Transcript* is from *trans-scribere*, to write over or across.

Pupil is from *pupilla*, a little girl. It is pleasant for most boys to find, from the study of Latin, that they have a little girl in their eye.

The study of Latin will prevent many mistakes in using language. A minister, who was accustomed to the expression

"fiend incarnate," in denouncing an individual, wound up his discourse by calling him a "man incarnate." Now incarnate comes from *in* and *carnis*, *caro*, meaning "in the flesh." A fiend incarnate, a devil in the flesh, is an unpleasant personage, but a man incarnate, a man in the flesh, is something very common and by no means necessarily bad.

You will have seen by the few examples, which are chosen from our common talk, that a knowledge of Latin keeps us from absurd mistakes, gives us fine points and distinctions, brings up pictures, even histories, to the mind, and aids us in expression and in force of language in our every-day intercourse with one another.

The Gas Wells of Erie, New York.

It is something worthy of extra notice, says the *Iron Age*, to find a city lighted, and its dwellings warmed, with natural gas, procured merely at the same expense as boring for water. Erie rejoices in this blessing, and the subject is still sufficiently new to be interesting. The first presence of gas was noticed, four years since, in digging a potash well within the city limits, the flow of gas from which nearly suffocated the workmen. This well was filled up, but the same result occurred in another near by. Experiments were then made by sinking tubes in the mud of a stream and igniting the escaping gas, which burned freely. To a Mr. Brevillier, an intelligent German, is due the first practical action in the matter. This gentleman, associated with a few others in a company, sunk a well for petroleum on his premises; as an oil well it was a failure, but as a gas machine, a splendid success. For three years it wheezed and gas-ed until, the lease of the company expiring, the proprietor laid pipes conveying the gas to his house and soap works, where it has since been used. Not one pound of coal has been consumed since then in the establishment. The various processes of melting, rendering and soap boiling are carried on with gas as the fuel, the building is illuminated, while a beacon on the roof lights that portion of the city. With all this, and the amount used for lighting, warming and cooking in his dwelling, but one-sixth of the gas furnished by the well can be used, the remainder escaping through a safety valve. At the Conrad brewery a gas well was lately opened, by which vats of lager are kept boiling, and malt ovens working with an even temperature, the steam gauge standing at 75 day after day, without a change of a pound per day, and all without care from any one. The uniformity of pressure keeps the stream of flame under the boiler or kiln at an exact strength, supplying the most perfect heat for brewing. But one-fourth of the gas from this well is used. The city, also, has utilized the product with the happiest results. A well was put down by the City Gas Company, near the main reservoir, which has yielded a uniform daily supply of 24,000 cubic feet. This is conducted directly into the reservoir, and 12,000 feet of manufactured gas added, thus furnishing the daily supply of the city.

Hear how a private individual luxuriates in native fuel, free of cost: State Senator Lowry has a model well, from which pipes lead to every grate in the house, to the kitchen range, and to smaller pipes for chandeliers. In fire places are laid the Fruch imitations of wood, pierced with minute openings to permit the escape of gas, thus simulating the cheerful blaze of the wood fire. An inch pipe supplies the unconsumable firewood, while a small bronze wheel regulates the supply by a turn. With fourteen fires burning, sixty gas lights in the house and grounds, the Senator lives in an atmosphere of perpetual summer. He even warms the cellar for the purpose of a laundry drying room. The only unpleasant thing about this wonderful supply is the question of permanence. This is hopeful, however, for the first well sunk for oil is in its seventh year, with an undiminished yield of gas, while in some cases, as at the Erie Car Works, the supply increases with time. The average depth of the Erie wells is 600 feet, and the cost about \$1,500; as each well yields from 10,000 to 30,000 feet of gas per day, they generally repay their cost within three months. With the proximity of iron ore and facilities for receiving the ores of Lake Superior, Erie presents a splendid opportunity for the manufacture of iron with this fuel, free of cost. It is strange that with the energy for which the place is noted, this has not been attempted. Iron should be made here for \$12 per ton, if not less. Be this as it may, these wells certainly afford a most curious and gratifying evidence of nature's bounty.

GOOD HEALTH.

The Philosophy of Drunkenness.

A sudden mental emotion can send too much blood to the brain, or too great mental excitement does the same thing. It is the essential nature of all wines and spirits to send an increased amount of blood to the brain.

The first effect of taking a glass of wine or stronger form of alcohol, is to send the blood there faster than common; hence it quickens the circulation; that gives a red face; it increases the activity of the brain, and it works faster, and so does the tongue. But as the blood goes to the brain faster than common, it returns faster, and no special permanent harm results. But supposing a man keeps on drinking, the blood is sent to the brain so much faster, in such large quantities, that in order to make room for it, the arteries have to enlarge themselves; they increase in size, and in doing so press against the more yielding flaccid veins, which carry the blood from the brain, and thus diminish their size, their bores; the result being, the blood is not only carried to the arteries of the brain faster than is natural or healthful, but is prevented from leaving it as fast as usual; thus a double set of causes of death are set in operation. Hence, a man may drink enough brandy or other spirits in a few hours, or even minutes, to bring on a fatal attack of apoplexy; this is literally being "dead drunk."—*Hall's Journal of Health.*

Boiled Corn Beef.

This is a staple food in a majority of families during several months of the year, and in most cases the cooking may be greatly improved. The two chief errors are, first in not cooking it long enough, and second in losing a large proportion of its real nutriment. We always prefer it prepared as follows: Soak in warm, not hot water, just long enough to take out all excess of salt. Then cover it so that the steam will condense upon the under side of the cover and fall back. This will prevent boiling away and also the loss of much of the nutriment which goes off with the steam. Boil the meat several hours or until it is so thoroughly done that it will not hold together to be lifted with a fork. If there be any bones take them out, since if cooked enough, the meat will cleave from them readily. Pack the meat by itself in a deep dish, mixing well together the lean and fat portions. Next skim the fat and boil the liquor down so that when poured over the meat it will just fill the spaces between the pieces. Then lay over the whole a flat cover which will fit into the dish, put on a dozen or twenty pounds weight and let it stand until cold. Several flat-irons or a large stone will answer for the weight, or if convenient it may be set under a cheese-press. Prepared in this way, the poorest piece of tough corned beef will be made tender and juicy. Boiling down and using the liquid, saves the most nutritious portion which is usually thrown away. The gelatine of the condensed gravy, when cold forms a solid mass with the meat, which may then be cut up into slices for serving upon the table. If the fat and lean portions be mixed, when cut up cold, the pieces will present a beautiful marbled appearance. Corned beef prepared in this way will not only be eaten with a superior relish, but will not on account of its toughness, be swallowed half masticated.

The Uses of Walking.

Walking, for young and active people, is by far the best exercise; riding is good for the elderly, middle aged, and invalids. The abuse of these exercises consists in taking them when the system is exhausted more or less by previous fasting or by mental labors. Some persons injudiciously attempt a long walk before breakfast, under the belief that it is conducive to health. Others will get up early to work three hours at some abstruse mental toil. The effect in both instances is the same; it subtracts from the power of exertion in the after part of the day. A short saunter or some light reading before this meal is the best indulgence of the kind; otherwise the waste occasioned by labor must be supplied by nourishment, and the breakfast will necessarily become a heavy meal, and the whole morning's comfort sacrificed by a weight at the chest, from imperfect digestion of food. These observations apply especially to elderly persons, who are prone to flatter themselves into the persuasion that they can use their mental or bodily powers in age as in youth.

Endurance and Diet.

Even the experienced trainers of the prize-ring cannot decide what is the best food for training men up to their greatest powers of endurance. They have a prejudice in favor of mutton-chops and underdone beef steaks; but it is by no means sure that this is the best. The Roman soldiers—who conquered the world, and built roads from Lisbon to Constantinople, and who were all trained athletes, marching under a weight of armor and luggage that few men in our day could carry—lived on coarse, brown wheat or barley bread, which they dipped in sour wine.

In our own day, the Spanish peasants are among the strongest and the most agile men in the world. They will work all day in a copper mine, or at the olive press, or the wine press, under a hot sun, and then dance half the night to the music of a guitar. What does he live on? A piece of black bread, an onion, perhaps half a watermelon. You may see him dipping his piece of bread into a horn of olive oil, and then into some vinegar, made hot with pepper and garlic, and then he is happy. Sometimes he gets a draught of harsh, sour wine, but not strong. All the strong wine is sent to England.

The Smyrna porter walks off with a load of eight hundred weight. His only food, day after day, is a little fruit—a handful of dates, a few figs, a bunch of grapes, some olives. He eats no beef, pork, or mutton. His whole food does not cost him a penny a day.

The Coolie, living on his rice, can out-work the negro fed on bacon. The Arab, living on rice and dates, conquered half the world.

The most tremendous muscular force, and the greatest powers of endurance may be nourished upon a very moderate diet.

The Irish peasant is the strongest man on the face of the earth. And his principal food is potatoes and brown oatmeal bread, with buttermilk. He scarcely tastes flesh meat a dozen times a year.

Beneficial Results of Sunshine.

Seclusion from sunshine is one of the misfortunes of our civilized life. The same cause which makes the potato-vines white and sickly, when grown in the dark cellars, operates to produce the pale, sickly girls that are reared in our parlors. Expose either to the direct rays of the sun, and they begin to show color, health and strength. One of the ablest lawyers in our country—a victim of long and hard brain labor, came to me a year ago, suffering with partial paralysis. The right leg and hip were reduced in size, with constant pain in the loins. He was obliged in coming up stairs, to raise the left foot first on every stair, dragging the right one after it. Pale, feeble, miserable, he told me he had been failing several years, and closed with, "My work is done. At 60, I find myself worn out." I directed him to lie down under a large window, and allow the sun to fall upon every part of his body; at first, ten minutes a day, increasing the time until he could expose himself to the direct rays of the sun a full hour. His habits were not essentially altered in any other particular. In six months he came running up stairs like a vigorous man of 40, and declared with sparkling eyes, "I have twenty years more work in me." I have assisted many dyspeptic, neuralgic, rheumatic, and hypochondriacal people into health by the sun-cure. I have so many facts illustrating the wonderful power of the sun's direct rays in curing certain classes of invalids, that I have seriously thought of publishing a work, to be denominated the "Sun-Cure."—*Dr. Warren.*

How to GO TO SLEEP.—No doubt there are many of our readers who understand this delightful art to perfection; but there are certain conditions of animal economy, even in a state of health, when "tired nature's sweet restorer" refuses to close our lids, and seems pertinaciously to fly from us, though wooed ever so warmly. The most natural and facile method is to place the head in a comfortable position, and then, taking a full inspiration, breathe as much as possible through the nostrils. The attention must now be fixed upon the fact of breathing.—The patient must imagine that he sees the breath passing from his nostrils; and the very moment he brings his mind to conceive this, apart from all other ideas, consciousness and memory depart, and—he sleeps. The method is strange, but simple, and the experiment will prove its truth.

Table of Contents.

Bobbin Winder, Ill., Yosemite.....	273
MECHANICAL PROGRESS.—Endless Screw; Tunneling Machine; Compressed Metal; Boiler Engineering; Sherman Process; etc.....	274
SCIENTIFIC PROGRESS.—Electrical Machines; Arctic Expedition; Natural Selection; Bunsen Battery; Ocean Circulation; etc.....	274
Alkali; Cal. Cochineal; Grasshoppers; Bull Run Dist.; Public Lands.....	275
MINING SUMMARY; Shareholders' Directory; Mining Stocks; Market Rates.....	276-277
List of Patents; Notices of Patents; Refining Gold by Chlorine Gas; Rain Theory; Irrigation.....	278
The Latin We Speak; Gas Wells of Erie, N. Y.; Good Health.....	279
Population of S. F.; Oregon; Water Supply.....	280
Exploring Expedition; Roller Skate, Ill.; Medical Convention; Ice Machines.....	281
Fish; Vinegar; What We Eat; Domestic Receipts; Mechanical Hints.....	282
American Medical Association; Academy of Sciences.....	284

Notices of Correspondents.

SUBSCRIBER writes us: "Old brass spoons can be washed with quicksilver and made to appear like silver spoons; if the quicksilver is not poisonous, it is certainly a quick and cheap way. Is it dangerous?" It is. Quicksilver amalgamates with most metals, and thus effects a "false silvering." The public cannot be warned too strongly against such a "quick and cheap" method.

Population of San Francisco.

Mr. Langley has replied to the reply of Mr. W. G. Morris (U. S. Marshal) to the strictures of Mr. Langley on the U. S. Census. Mr. Langley defends the accuracy of his Directory, and answers certain challenges to publish a number of names omitted in the census, by publishing many more names than asked for. On one point both gentlemen agree,—in the enumeration of the Chinese.

We think that Mr. Langley shows that the returns of the census were too small. We would not assert that Mr. Langley's returns were absolutely correct. But then we can only judge concerning the arguments advanced on either side, for the careful examination and compilation of such statistics is a job too large for our hands and one which we must leave to others.

The matter is perhaps not yet settled to the satisfaction of the public. The popular belief is, so far as we can ascertain, that the census is too low and the Directory too high. The census takers could have no object in giving aught else than the truth, yet might have made mistakes. The Directory is concerned to have the numbers as high as possible; but enjoys the best of reputations for general accuracy. Any one acquainted in the slightest degree with the enormous labor of compiling such statistics, will agree that there are many chances for errors.

The question still remains for public satisfaction: 150,000 or 170,000? We modestly confess our inability to decide between the two. Splitting the difference is a common method of compromise, not always of the greatest accuracy, and probably, in the present case, not satisfactory to either of the two parties of the argument; yet we can just now suggest no better.

ABOUT TO ARRIVE.—The San Francisco Silk Factory will receive its machinery from the East in a few days. Twenty tons of it were shipped on the 15th ult.

Oregon.—A Want of Our Coast.

There is a State lying to the north of us which has an area as large as that of the States of New York and Pennsylvania combined, but with a population of a little over one per cent. of that of these two States. It has good society, numerous and excellent schools and churches, and offers manifold inducements for immigration. Its growth, although slow, has been steady and healthy, without wild speculations or financial crises to any great extent.

Its climate is varied, generally most pleasant and healthy and in some places unsurpassed. Its arable land is sufficient to support a million of people. The agricultural productions of its soil are many, and the fertility of the land very great. Fruits of nearly every description are raised with success. For the stock-raiser there is an abundance of excellent grazing land. Its timber is of immense extent and of the best quality for manufacturing and other purposes.

Oregon is also rich in mineral. Its placer mines have yielded extensively and although the cream may have been taken off, enough is left for still many a good days work. Its quartz mines are being opened and worked to a considerable extent. But its iron beds and its coal deposits, already yielding largely now, promise the richest results for the future.

Its salmon fisheries are by no means unimportant, engaging large amounts of capital and the labor of hundreds of men. The manufacturing interests are growing largely. Woolen, lumber and flour mills, form the most prominent items, but many other important branches of mechanical industry are well represented. The resources of timber, iron and coal, with the fertility of the soil, the favorable climate and the abundance of water power show what can be done in manufacturing.

Cities and towns are dotted here and there over the State. Railroads are being built to traverse the land in various directions. Good wagon roads already exist. Such are a few items about Oregon.

What Oregon Needs.—What the Pacific Coast Needs.

Now what does Oregon want? Immigration, and immigration of a certain kind. It does not want people who are willing to reside only in cities. Such men and women had better stay away. It is not the large towns which demand immigrants; these can get population at any time hereafter. But it is the people to go into the country, to till the land, open the mines, cut the timber, raise stock; it is men of stout limbs and willing hearts. One man in the country is worth three in the city. In the country there is room for all and work for all; in the city there is room and work for only a certain number, and that number is certain to be filled as necessity requires. The city can always get all the people from the country that they want; the reverse is not true.

Oregon does not want to have a quarter of her population in one place. It sounds rather nice to be able to talk of our large centers of trade and population; but Oregon is too young and too poor yet to be able to live on sound.

The great question is, how to get population. Ben Holladay is taking a step in the matter which, if successful, will prove an immense benefit to the whole coast; for he will introduce an industrious and law-abiding community where it is needed. The railroads are attracting people. The Board of Statistics, Immigration, and Labor Exchange of Portland are publishing pamphlets for general distribution, giving statistics and the like, and are otherwise doing good work. We are indebted to them for a number of publications, and likewise to the State Agricultural Society.

Now these publications are excellent and undoubtedly do much good. But they fail to answer the very first question of all would-be immigrants, and a question of vital importance to them. These people as a general thing have no money to spend in traveling all over our extensive coast in order to find where to settle. They want to know just where to go to. They require to be told where land is open to pre-emption or under the homestead law, as well

as where it is for sale at moderate prices.

Before immigration can be induced in large numbers by the publications, these pamphlets must have maps appended to them, and in these maps must be denoted the vacant lands, as well as the lands for sale, and the descriptions must give something concerning these localities. Whatever its relative advantages or disadvantages, we believe that that section which publishes such maps and has out live agents, will be the first to grow in wealth and numbers.

The remarks which we have made concerning the needs of Oregon, will apply with equal force to any part of our coast. We are far off from the great centers of population, farther from them than they are from us, for we are more accustomed to venture forth into the uncertain. We must show them not only what we have, but where we have it; for to wander over the millions of square miles of our coast in order to pick out a home is what the immigrant will not and cannot do.

Our Water Supply.

We have been having another deluge of water discussions, of which we enjoyed so copious a supply a year ago. The discussion has, to some considerable extent, been muddled through personal interests and through the prevalence of San Francisco fogs and sand, all of which have apparently collected in the eyes and ears of many of our worthy citizens to such an extent that it has been hard for them to get a clear, impartial view of the question.

Three propositions are now placed before the public. Two of these are for furnishing water by private parties, the third for a public or a private enterprise, as the city may elect. They are: the Peninsula supply, represented mainly by the Spring Valley Water company; the Lake Tahoe supply, represented by Col. Von Schmidt and associates; and the Blue Lakes Project, represented by W. V. Clarke. The latter has not been pushed so much as the others, although we have good reason to think that we shall hear more of it before many years have elapsed.

The question as to whether we can get a sufficient amount of good water from this Peninsula is naturally the first to arise. This is by no means settled. That our present supply is insufficient we think is now universally allowed. We need only to quote the words of Mayor Selby, a gentleman removed from all grounds of suspicion even. He says: "That the amount of water now supplied to the city will not suffice for the future, is obvious. With the present resources, the Spring Valley company are unwilling to allow water to be used for flushing the sewers, street sprinkling, and for the public grounds." In view of this statement, any figures as to the mere capacity of reservoirs are of but little account. It is easy enough to build large reservoirs; the difficulty is to fill them with good water.

We are inclined to doubt the probability of our getting enough good water from the Peninsula. The area of catchment is large enough and the amount of rainfall sufficient, if we can catch and preserve the whole amount. But then to get the benefit of this, the city must own the area, keeping off farmers and others. We cannot use water collected in dribbles from cultivated lands. And, again, water kept nine months in pools is hardly to be regarded as a wholesome article.

The Lake Tahoe project is certainly worthy of consideration. The plan is to take the water from Truckee river at a point some four miles from the lake, thence to carry it by Squaw Valley to a tunnel, 12,000 feet long, which is to be cut through the Western Summit. From here the water will be led to the bed of the North Fork of the American River. The water may be taken again from the river at or near Dutch Flat and run by canal to Auburn, or it may be taken out higher up for use in the mining localities south of this.

From Auburn a pipe will lead to Sacramento, then to Vallejo or vicinity, across the straits of Carquinez, to Alameda, and under the Bay to this city, having a pressure here of some 370 feet.

This project has the advantage of excellent water and of being of immense importance to the mining districts on the way. There are, on the other hand, great engineering difficulties and perhaps trouble from the State of Nevada. The company ask a loan from the city to the extent of six millions of 6 per ct. thirty-year bonds on supplying 20,000,000 gallons daily, and will furnish 20,000,000 gallons additional, at or near Auburn, if required, the city to pay the expense of laying their own pipes. The Board of Supervisors having passed an order providing for the issuance of the bonds, the Mayor has vetoed it as a most unwise business transaction, and the veto has been sustained.

The last, the Blue Lakes, project, is to take water from the Blue Lakes, in Alpine county, and the head waters of the Mokelumne, lead it in a canal to Spring Valley, near Mokelumne Hill, thence by pipe to Livermore Pass, thence to Alameda, and across the Bay to this city. This has also the advantage of a full supply of excellent water, no question as to rights, immense benefits to mining and agricultural districts, etc. The distance is given as one-fifth less than that to Lake Tahoe. Mr. Clarke proposes to give the city the entire ownership of the works, which he will build for them. The city would then be able to get a large revenue from sales of water on the way.

Now we do not propose to argue in favor of or against any one of the projects. We protest, however, against the way they are received by the public. The chief point in favor of the Peninsula supply, in the popular mind, is an unwillingness to give any more money, at present, than is absolutely necessary from the city treasury, because so much is lost in every such transaction by dishonest operations. There is an opinion that sufficient for the day is the evil thereof, and an inclination to let the future take care of itself; this is natural, but hardly wise.

Besides this, possible trouble with Nevada, and distrust of the financial ability of the company, and want of security to the city, are the arguments against the Lake Tahoe project.

The Blue Lakes project is not so widely known. Somebody didn't know that there were any such lakes, or didn't want to know it, and it was squelched in the Board of Supervisors, although it was a direct proposition to let the city own the works.

Now this is not the right way to deal with one of the most important subjects of the day. We cannot take it for granted that there is or is not a proper supply on the Peninsula, that we can or cannot get water from Tahoe, that we can or cannot own water-works furnishing a sufficient supply from the Blue Lakes, that there are or are not other available sources of supply.

We ought, as the Mayor suggests, to have the whole matter thoroughly examined by proper persons,—by a board of engineers, we would suggest, to be appointed by his Honor, Mayor Selby. A proper examination of the Peninsula, and of each of the above projects, or of any others proposed, would cost us some money, but it would save the city an immense amount. If we expect that San Francisco will become the important place of which we talk so much; we must provide for its future.

A THOMPSON ROAD STEAMER, from the factory of D. D. Williamson, Patterson, N. J. (office at New York), will be in Stockton about the 10th inst. Another will be at Salt Lake City, about the 8th, having been ordered by the Youngs. The manufacturers are receiving very heavy orders for this engine, for use in all parts of the country.

Another Exploring Expedition.

Over a year ago, a party was formed to make a typographical and geological survey of Nevada and Arizona, to fill up the gaps left by previous U. S. surveys. The expedition was to be made by the government, under charge of Lieut. G. W. Wheeler, of the U. S. Corps of Engineers. The party assembled in this city, some coming from the East, but there was a hitch in regard to getting transportation, and the company was disbanded.

Lieut. Wheeler has since been at Washington, has been able to organize a second party and make all necessary arrangements, and on last Tuesday the expedition started off. As it is unusually strong in talent, we append the names.

OFFICERS.—Geo. W. Wheeler, U. S. Engineer Corps; E. W. Bass, U. S. Engineer Corps; D. A. Lyle, Second U. S. Artillery.

MEDICAL AND PERSONAL STAFF.—Surgeon, A. H. Cochrane; Hospital Steward and Naturalist, Frank Hecox; Hospital Steward, T. V. Brown; Secretary, Fred. W. Loring.

PROFESSIONAL ASSISTANTS.—Geologist, G. K. Gilbert; Collector, Fred. Bischoff; Collector, J. Kochlor; Assistant Observer and Computer, E. P. Austin; Assistant Observer and Assistant Geologist, A. P. Marvin; Meteorologist, William J. Bradley; Chief Topographers, P. N. Hamel, Lorin Nell; Assistant Topographers, Chas. E. Fellerer, J. K. Mauran; Photographer, J. H. O'Sullivan; Artist and Photographer, E. Richardson.

Mr. Gilbert is one of the best-qualified persons for his position who could be found. He was recently attached to the Ohio Geological Survey, and is very warmly endorsed by Prof. Newberry. Mr. Austin is very favorably known from his connection with the Observatory of Harvard University. Mr. Marvin is from the Harvard Scientific school. Mr. Loring, who graduated last year at Harvard, has ample qualifications. Mr. Hamel is one of the very finest draughtsmen in the country. The rest are also of the highest reputation.

The party go to Camp Halleck, on the C. P. R. R., and then strike south, exploring sections of southern Nevada, California, Utah, Arizona and New Mexico, and continuing surveys previously made by Lieut. Wheeler and others. The directions are broad, ordering extensive examination into the climatic, geological, mineral, agricultural and topographical conditions. An appropriation of \$50,000 has been made for the work. The Western Union Telegraph Company will give all possible aid for the determination of the latitude and longitude of points selected.

The report of the expedition will be a valuable contribution to science, and a practical benefit to the people of this section of the Union. The support of such explorations is creditable to the age. We know but little of a great part of our country, and what we do know is very imperfect. We are rejoiced at the prospect of further and more extensive explorations. We have some grounds for believing, we may add, that we shall have a National Geological Survey before many years have elapsed. That would be a consummation devoutly to be wished.

A WELCOME CALL.—We have had the pleasure of a visit from Gen. Spear, Examiner in the U. S. Patent Office, and J. M. Thatcher, one of the members of the Board of Appeal. These gentlemen are on a flying visit to our State and intend to make the rounds of our slightly places. Two weeks is a short time to stop in California, particularly if one does his visit justico by a peep at all of our curiosities; but enough can be seen to get a good idea of what we are, and what we expect to be, more especially the latter, if one takes the word of a '49-er. We wish these gentlemen a pleasant round trip and all the benefits possible to be derived from it.

A New Roller Skate.

The introduction of roller skating upon this coast has created an excitement in almost every hamlet and village in the country, which is unequalled since the days of the short-lived velocipede; but unlike the velocipede, the skating mania "holds out to burn," and the probability is that it will hereafter be one of our permanent sports. It is certainly a pleasant one, and besides the pleasure it has the advantage of being a healthful exercise. With persons living in a cold climate, ice skating is the winter exercise, but the season of ice is limited, and consequently the skates must be hung up to await another winter's ice. The present style of skating, however, can be enjoyed in all seasons and at all times, the only necessity being a good smooth floor, in lieu of ice.

Roller skating is no new invention. The old parlor skate, which was constructed with several rollers placed in line under a foot-block, was extensively used many years ago, but not until the skate was constructed so as to carry the skater in curves in either direction, by the movement of his body, did this kind of skating amount to much.

As an exercise, skating is unequalled.

BOONE'S IMPROVED ROLLER SKATE.

Fat men skate to get lean, and lean men skate to get fat, and for all that we know to the contrary, both are successful. The exercise is graceful, and the gliding sensation pleasant—that is, after one has learned to glide, which consummation is arrived at only after sundry and awkward attempts, often resulting in seeing stars in the ceiling.

The illustration presented herewith represents a new and improved style of roller skate, which is known as the C-spring skate. This skate has no foot-block, but instead has two longitudinal steel springs, A, A, one passing along at each side of the foot, so as to act as a foot-support and at the same time serve as a means of cramping the rollers to the position to run the skate in a curve. These springs are united together by a cross-bar, B, which is directly below the ball of the foot, and a curved metal bar, C, extends from this bar to rudders, D, which form a part of the axles, so that as either spring is depressed, the curved bar, C, shifts the rudders so as to cramp the rollers.

The skater stands upon the springs which are strapped to his feet, and by simply leaning his weight to either side, he cramps the rollers and makes the curve.

In putting this skate together, nothing but rivets are used, so that it is almost impossible to break or otherwise get them out of order.

This skate will be more especially use-

ful where the skating floor is uneven, on account of the elasticity of the foot-support, upon the same principle that it is more pleasant to ride in a spring carriage than in a lumber wagon.

A patent for this skate has been granted, through the SCIENTIFIC PRESS Patent Agency, to Mr. John L. Boone, of this city, covering the employment of longitudinal side springs as a foot-support, and as a means of cramping the rollers, and to him all letters should be addressed. City, County, State and Rink rights for sale. All rights are guaranteed to be no infringement upon any existing patent.

The Medical Convention.

We are glad to see so much interest evinced in the meeting of the physicians in our city. Invitations from individuals and from associations, to eat, drink and be merry, to walk and ride, to visit and be visited, have been extended hospitably and freely. We think that our eastern friends will carry back pleasant memories of our coast. The convention is really a most important one. The American Association has existed now for many years and has attained the highest position and drawn into its ranks the best of medical talent.

lowed it by others about 1860. Soon after a number of French and English patents were taken out, one of the most noted of which was that of Edward Carré, of Paris. Although the principle of continuous action in artificial freezing has been known so long, yet on account of the many difficulties, especially the mechanical ones, the advance in the art of manufacturing ice in bulk has been very slow.

In speaking of this manufacture, we leave out of account the "frigorific" or freezing mixtures, as salt and snow, etc., etc., which are as numerous as the leaves of autumn, but are of no practical value except on the smallest scale. There are, then, but two methods in use. The first and most successful is by employing volatile liquids, which evaporate rapidly at low temperatures. The second is the rapid expansion of non-condensable gases, atmospheric air being the most common.

An example of the first method is the Carré process, alluded to above. In this, the volatile liquid is ammonia, which can be absorbed in large quantities in cold water and again expelled by heat. Although this principle required complicated, extensive and heavy machinery, yet after a long series of experiments and expenditures, this method has been improved so as to be now in successful operation in New Orleans.

The first to employ the expansion principle was, we believe, Dr. John Gorrie, of New Orleans, after whom came Kirk, of Scotland, and more recently Winhausen, of Germany. Their machines all employ atmospheric-air machines, which demand great power and consequent heavy expense.

It will be seen from the above brief remarks, that American inventors have just claims to priority in this matter. We are assured that California inventors are now the first to produce a most simple and inexpensive machine which manufactures the clearest and purest of ice at a very small cost. These inventors are Messrs. Martin & Beath, of this city. They claim in their latest improvements to have done away with the tin vessels which held the water to be converted into ice, and also the non-congealable fluid used in their first experiments. These were found objectionable; with every care, the ice produced carried a taint imparted by accidental contact with this fluid. By their present plan, the water to be frozen is the only water placed in the tank or refrigerator; the action is now direct, and such that the cost of a ton of ice is less than that of cutting and housing it on the ice-fields of the Pacific coast.

One of Messrs. Martin and Beath's ice machines has recently been built at Los Angeles, where it is now in successful operation. Another, capable of producing two tons daily, will be shipped this month to Honolulu. A third, of 25 tons daily capacity, is now being built and will be soon running in this city, on Stowart street, near Folsom, for the purpose of supplying San Francisco and vicinity. The small expense of constructing and working the machine enable the proprietors to proceed without resorting to the usual method of incorporation and subscription.

THE HEATHEN CHINEE.—One of the handsomest, neatest and most interesting publications which we have seen lately, is the pamphlet just issued by the publishers of the *Overland Monthly*. It is an admirable fac-simile of the original manuscript of the "Heathen Chinee," as written by F. Bret Harte, with all its interlineations and corrections, together with the letter-press copy as it appeared in the *Overland* of September, 1870, embellished with a capital likeness of the author. The lithographic execution is very fine. To possess a likeness of Bret Harte and a specimen of his handwriting, is surely enough to warrant the expenditure of 25 cents, the price of this publication. The little gem issues from the office of John H. Carmany & Co., 409 Washington street, and is for sale by all news-dealers.

GARDENING FOR PROFIT.—It is said that by good culture and repeated crops over \$350 has been taken from the product of a piece of ground only 40 feet square, cultivated with garlies.

We are glad to see the physicians of the coast enjoying a high position among their brethren; it redounds to our general credit.

Our city is now filled with medical men. At the hotels, on the streets, in the places of business, one sees our medical visitors, and is moderately safe in addressing any stranger with the title of doctor. Between two and three hundred are reported in attendance at the Convention. Of course a large number comes from this State, but the eastern visitors are in strong preponderance. We hope they will not confine their visits to the city and vicinity but will go to the other places of note and interest.

We give in another place a brief report of the proceedings,—all that we have space for.

Ice Refrigerating Machines—Claims of American Inventors.

The claims of American inventors for improvements in the manufacture of ice are not, perhaps, generally recognized in our country. The first patent of the kind accorded in England was that of Jacob Perkins, an American, in the year 1835. His patent related to the vaporization and condensation and continuous use and re-use of a volatile liquid,—not confined to any one liquid, but expressing a preference for ether. In 1850, A. C. Twining, of Ohio, patented in the United States and England an improvement in this machine, and fol-

DOMESTIC ECONOMY.

Fish as Food.

Fish meat affords better food for students and literary men than for those engaged in active or laborious manual labor. The common white-meated, slow-moving fish, such as cod, haddock, etc., contain about the same quantity of nitrates as beef or mutton, but more of the phosphates. The more active fish, such as trout, shad, etc., contain larger quantities of both nitrates and phosphates than beef or mutton—and this excess is just in proportion to the natural activity of the fish.

Nitrates and phosphates furnish food for the muscle and brain and give activity to the body and mind. Hence such food should be chosen for invalids and convalescents. Such fish, however, should be eaten with potatoes, or some farinaceous food to furnish the requisite carbonates, in which they are deficient.

There is a class of fishes, such as salmon, halibut, mackerel, etc., which are sometimes called oily fishes, which contain a large amount of carbonates, in the form of fat, and which are not easily digested; these are not suitable for invalids, but are very useful food for laboring men, or for old people, who need the fat to keep up the animal heat which they are losing by age.

Salted fish is far less nutritious than that which is eaten fresh; as the brine absorbs most of the albumen or nitrogenous principle, as well as most of the phosphates, both of which, as we have shown, are of great value in fish food, but not the fibrine, which goes to build up the muscles. Salt fish is therefore more suitable for laboring people, than for invalids or sedentary persons.

Fish, when properly prepared, and suitably selected, according to the condition of the system, furnishes an excellent article of food, and is quite readily digested, as will be noticed by reference to another article in this department to-day. Fish, however, should always be eaten as fresh as possible. An exposure to a hot sun, even for a single hour, greatly injures its character. Decomposition commences in fish flesh much sooner than in any other kind of flesh; and after it has commenced it becomes much more disgusting and poisonous than beef or mutton. Our medical correspondent of last week will excuse us for still insisting that decomposed food is poisonous to the human system, when taken into the stomach.

Vinegar.

What is a Good Article, and How to Use it.

Vinegar is sometimes the only spice, the only condiment of the poor, and for the sake of humanity, the trade as well as the government should do all in their power to procure for us good vinegar, made of wine. There should be no tax or duty on wine vinegar, and no other should be used, especially in a State where the vine flourishes as it does in California.

For the rich too, and the epicure it is an important matter to have good vinegar. Next to good oil, it is the principal constituent of a good salad. It is also indispensable in preparing sweet preserves, which should be more extensively used than they generally are. The *Fruit and Wine Reporter* in speaking of this condiment says: Good vinegar must be of a light yellow color, it must show a high degree of acidity without any empyreumatic flavor. It must have an agreeable odor, easily recognizable as that of acetic ether. The genuine wine vinegar, will not produce the feeling of roughness on the teeth when it is taken on the tongue.

On the liquor scale Baumé it marks 2.50 to 2.70, and is saturated with carbonate of soda, pure and very dry, at the rate of 6 to 7 per cent. of its specific weight.

Good vinegar is not, as it has been sometimes stated, a mere compound of acetic acid and water. With those two substances are combined the salts contained in the wine of which the vinegar is made. When distilled, it must give 1 to 1½ per cent. of alcohol. In brief, a mere compound of

acetic acid and water is no vinegar, any more than a compound of alcohol and water is brandy.

How to Test Vinegar.

A drop of good wine vinegar, when thrown on a piece of white paper, will, when evaporated, leave there no noticeable trace. But if the vinegar contains sulphuric acid, a dark spot will appear. Nitric acid still will leave no trace.

Blue paper is colored red by vinegar, but when drying, it changes gradually into violet; but if the vinegar contains any kind of mineral acids, the red color remains forever.

To examine a vinegar suspected not to be genuine, take a silver spoon, fill it with the vinegar, add a small bit of carbonate of soda, let it evaporate over a lamp, and if it, being calcinated, disengages an empyreumatic odor, (like tar) you may be assured that it contains extracts distilled from wood. However well those extracts may have been rectified, the above method will reliably indicate the presence of the substance, even if the vinegar contains only 5 per cent. of it.

What Shall We Eat?

Here are some of the common articles of food, showing the amount of nutriment contained and the time required for digestion:

	Time of digestion.	Am't of Nut'mt.
Apples raw.....	1 h 50 m	10 pr. ct.
Beans boiled.....	2 h 30 m	87 pr. ct.
Beef roasted.....	3 h 50 m	26 pr. ct.
Bread baked.....	3 h 30 m	80 pr. ct.
Butter.....	3 h 30 m	90 pr. ct.
Cabbages boiled.....	4 h 30 m	7 pr. ct.
Cucumbers raw.....	2 h 00 m	2 pr. ct.
Fish boiled.....	2 h 15 m	20 pr. ct.
Milk fresh.....	3 h 12 m	7 pr. ct.
Mutton roasted.....	2 h 15 m	30 pr. ct.
Pork roasted.....	3 h 45 m	24 pr. ct.
Poultry roasted.....	2 h 30 m	27 pr. ct.
Potatoes boiled.....	1 h 00 m	12 pr. ct.
Rice boiled.....	2 h 30 m	87 pr. ct.
Sugar.....	2 h 30 m	36 pr. ct.
Turnips boiled.....	4 h 00 m	4 pr. ct.
Veal roasted.....	4 h 00 m	25 pr. ct.
Venison boiled.....	1 h 30 m	25 pr. ct.

POTATO FLOUR.—Few persons in the United States are aware of the demand for farina, or potato flour, and of the almost unlimited extent of the market that can be found for this product, which is simply the dry, evaporated pulp of the ordinary potato, the whiter and more free from black specks the better. It is used for sizing and other manufacturing purposes, and with the aid of precipitation and acid is converted into starch. In Europe it meets a large and increasing demand, in its primitive state, as potato flour; and in Lancashire alone 20,000 tons are annually sold, and as many more would be taken if put into the market. When calcined it is used largely for silk dressing and other purposes.

Generally the quotation for potato farina in Liverpool is a little over 4 cents a pound, while wheat flour is about 2 1/6 cents a pound; so that the potato flour is nearly double that of the wheat at the present rate. Consignments to Liverpool are solicited by the brokers there, who promise to take all that can be furnished.

How To Eat.

An English magazine has brought to light a "manual on social etiquette," which was promulgated many years ago. We give an extract or two:

"Gentlewomen, the first thing you are to observe is, to keep your back straight, and do not lean your elbows on the table. Discover not by any ravenous gesture your angry appetite, nor fix your eyes too greedily on the meat before you as if you would devour more that way than your throat can swallow."

In another page: "Do not eat spoon-meat so hot that the tears stand in your eyes, or that thereby you betray your intolerable greediness. Do not bite your bread, but cut or break it, and keep not your knife always in your hand, for that is as unseemly as a gentleman who pretended to have as little a stomach as she had a mouth, and, therefore, would not swallow her peas by spoonfuls, but took them one by one, and cut them in two before she could eat them."

Gentlewomen are further instructed: "Fill not your mouth so full, that your cheeks shall swell like a pair of Scotch bagpipes."

Gentlewomen are also pleasantly put on their guard against the possible perpetration of certain minor misdemeanors: "You will show yourself too saucy by calling for sauce or any dainty things. Avoid smacking in your eating. Forbear putting both hands to your mouth at once; nor gnaw your meat, but cut it handsomely, and eat sparingly." The latter admonition is addressed to what the author styles "the female younger sort," but always gentleman born and bred.

Domestic Receipts.

GERMAN BISCUITS.—Beat the butter to a cream, and mix in the flour and the cream and the well beaten eggs, to form a nice, light dough; mix all well before kneading it; roll it in thin, long, narrow strips, flavor to taste, and bake on a tin in a quick oven.

RIBBON BISCUIT.—Mix butter, sugar, eggs, milk and nutmeg together, cut in ribbon shape, bake in a moderate oven.

PLAIN SUGAR BISCUIT. Dissolve the butter in the milk warm, stir it into the flour to make a firm paste, roll it out thin, and cut it with a tumbler, prick each biscuit and bake in a hot oven.

A LUNCHEON CAKE.—One pound of flour, four ounces of butter, six ounces of moist sugar, quarter of a pound of currants, quarter of a pound of stoned raisins, spices and candied peel to the taste; a teaspoonful of carbonate of soda, mixed in half a pint of cold milk, all to be mixed together into a paste; then put into an oven without being set to rise. It will take an hour and a half to bake.

WASH FOR CLEANSING SILVER AND BRITANNIA WARE.—Take one pound of common hard soap, three table-spoonfuls of spirits of turpentine, and half a tumbler of water. Allow the soap to dissolve; then boil ten minutes, and before it cools add six table-spoonfuls of spirits of hartshorn. Make a suds of this preparation, and wash the silver with it.

TO IRON VELVET RIBBON.—Dampen the under side slightly, and draw it backward and forward over a hot stove-pipe until the velvet is quite dry. A still better plan is to lay a wet piece of cotton cloth on a hot flat-iron placed upside-down, and while the steam is rising from it, to draw the under side of the velvet tightly backwards and forward over the cloth.

TO MAKE LEAVEN.—Stir corn meal in a pint of fresh buttermilk; add an old yeast cake dissolved in water; make it about the consistence of batter bread, and set in a warm place to rise. When well risen, add more meal, make it into cakes, and dry in the shade.

A USEFUL RECEIPT.—Rub four parts, by weight, of yolk of eggs, in a mortar with five parts of glycerine. This compound has the consistency of honey, is unctuous, like fatty substances, but is easily removed by water. Applied to the skin, it forms a varnish, which effectually prevents the action of air. It allays the itching in cutaneous actions. It is unalterable, and can be exposed to the air for an indefinite period.

Mechanical Hints.

TO UNITE WATER-PIPE.—An excellent material for uniting water-pipes is prepared by combining four parts of good Portland cement and one part of unslacked lime, mixed together in small portions in a ston mortar, adding enough water to permit it to be reduced to a soft paste. Pipes thus united have been in use more than six years without any leak.

A CEMENT TO STOP FLAWS OR CRACKS IN WOOD OF ANY KIND.—Put any quantity of fine sawdust of the same kind of wood into an earthen pan, and pour boiling water on it; stir it well, and let it remain a week or ten days, occasionally stirring it, then boil it for sometime, and it will be of consistence of pulp or paste; put it into a coarse cloth, and squeeze all the moisture from it. Keep for use, and when wanted, mix a sufficient quantity of thin glue to make it into a paste; rub it well into the cracks, or holes in your work with it. When quite hard and dry, clean the work off, and, if carefully done, you will scarcely discern the imperfection.

WHITE POLISH FOR LIGHT WOODS.—White (bleached) shellac, 3 oz.; white gum benzoin, 1 oz.; gum sandarac, ½ oz.; spirits of wine, or naphtha, 1 pint; dissolve.

APPLICATION FOR PREVENTING OXIDATION OF IRON.—The following composition is used for preventing the oxidation of iron, especially the bottoms of iron ships. Seventeen pounds of powdered sulphur, five pounds of the lye or caustic potash of thirty-five Baumé and one pound of copper filings, are to be heated together until the sulphur and copper have completely dissolved. During the process seven and a half hundred weight of tallow and one and a half hundred weight of turpentine are to be heated together in another vessel, until the tallow has completely disappeared. The two solutions are then to be carefully stirred together when hot, and applied immediately with a brush.

LIFE THOUGHTS.

He who has not forgiven an enemy, has never yet tasted one of the most sublime enjoyments of life.

HABIT is a cable. We weave threads of it every day, and at last we cannot break it.

He has hard work who has nothing to do.

BEAUTIFUL is that benevolence which works silently and in the shade.

Those who would go to Heaven when they die must begin Heaven while they live.

It is folly to expect to break off a habit in a day which may have been gathering strength in you for years.

MASTERS OF VICTORY.—The nerve that never relaxes, the eye which never blanches, the thought which never wanders; these are the masters of victory.

If we were only half as lenient to the living as we are to the memory of the dead, how much happiness might we render them and how much remorse might be spared, when the grave has closed over them.

Industry.

Man must have occupation, or be miserable. Toil is the price of sleep and appetite, of health and enjoyment. The very necessity which overcomes our natural sloth is a blessing. The whole world does not contain a brier or thorn which divine mercy could have spared. We are happier with the sterility, which we can overcome by industry, than we could have been with spontaneous plenty and unbounded profusion. The body and the mind are improved by the toil that fatigues them. The toil is a thousand times rewarded by the pleasure which it bestows. Its enjoyments are peculiar. No wealth can purchase them, no indolence can taste them. They flow from the exertions which they repay.

WHAT IS A MAN?—No man is a man till he is tried; till he has passed through the ordeal—through deep water and scorching fires. A man surrounded by comforts, friends and relations, food and raiment; whose barns are filled with plenty, and whose presses gush out with new wines; who eats his fill, sits and reads, doles about taking his ease and pleasure, smoking his pipe and chewing his cud; is he a man? Far from it. A man is not a man until he is proved—has passed the ordeal—drank the bitter cup; risen above life's conflicts; mounted the billows of the sea.

IMMORTALITY.—Turn whithersoever we will, we find the belief in immortality. In every nation ever known, in every race that has ever lived, in every age of this changing world we find it. Every language known to man, as now or heretofore spoken among babblers of this earth, is constructed in accordance with it. In all ages men dying have looked on death as simply the soul's putting off its tabernacle. There are exceptions, but they are so few that they hardly attract our attention, and do not destroy the practical accuracy of the statement. The belief in immortality is one of the universal convictions of the race.

LIFE.—It is not perhaps much thought of, but it is certainly a very important lesson, to learn how to enjoy ordinary life, and to be able to relish your being without the transport of some passion, or gratification of some appetite. For want of this capacity, the world is filled with whetters, tipplers, cutters, sippers, and all the numerous train of those who, for want of thinking, are forced to be ever exercising their sense of feeling or tasting.

THE HUMAN SOUL.—Is the light in the soul of a human being an incomprehensible electric spark that cannot be laid hold of, and which flashes up in resolve and act? So long as there is no storm in the sky we send at will the spark over the extended wire, but when the great, primitive forces of nature manifest themselves, the human message is no longer transmitted, and the sparks spontaneously play upon the conducting wires. Chaos sends forth an unintelligible message.

LIBERTY OF CONSCIENCE.—Condemn no man for not thinking as you think. Let everyone enjoy the free liberty of thinking for himself. Let every man use his own judgment, since every man must give an account of himself to God. Abhor every approach, in any kind of degree, to the spirit of persecution. If you can not reason or persuade a man into the truth, never attempt to force him into it. If love will not compel him to come, leave him to God, the judge of all.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier.
You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render all other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous.
Please favor us with your orders PROMPTLY, and oblige

Pittsburgh, Pa.,

AND IS THE LEADING—IF NOT THE ONLY—REP-
RESENTATIVE JOURNAL OF THE METAL
TRADES PUBLISHED IN THE
UNITED STATES.

Located in the very centre of the metal interests of the United States, with offices and correspondents at the leading cities in the East, West and South, we do not err in claiming that it is the REPRESENTATIVE JOURNAL of the Metal Manufacturers, Workers and Dealers of this country.

THE IRON WORLD AND MANUFACTURER has a large and extended circulation throughout the United States, and is taken by Iron and Steel Manufacturers, Machinists, Founders, Hardware Dealers and Tanners, Gun-smiths, Plumbers, Cutlery Manufacturers, File Manu-facturers, Saw Manufacturers, Boiler Manufacturers, and by

Leading Railway Officials.

It advocates protection to American Manufacturers. Its markets are full and reliable. If you are a manu-facturer, take the journal that advocates your interests. Don't patronize Free Trade journals, but help those who help you.

With Free Trade the manufacturers of this country would be ruined. English gold is scattered with a liberal hand to further Free Trade. Expend some of yours to favor Protection.

If you advertise, which is the best medium? Circulation being equal, which would you patronize—a Free Trade journal or a Protection journal? Circulation is considered the value of an advertising medium. Much depends on the character of the circulation. The New York Weekly Tribune claims 200,000 circulation, and gets from two to five dollars per line for advertising. The Iron World reaches more people engaged in the metal business than the New York Tribune. Our rates are about ten cents per line. Which will pay the best?

The Illustrated Excelsior Magazine

Has been reduced from \$2.50 to \$1.00, and is now one of the CHEAPEST in the world. The illustrations alone are perhaps worth more than the cost, and the beautiful STEEL ENGRAVING of Evangeline (postage, etc., being sent) is given. Size of paper on which the steel engraving is printed is 2 feet by 19 inches. The Magazine contains Stories, Pictures, Puzzles, Music, a Lady's Department, with illustrations of ladies' patterns; a Youth's Department, etc., etc.

I hereby specially offer the Magazine for One Year also this splendid steel Engraving, for the regular subscription price, \$1.00 and 8 cents for postage and pack-
ing of engraving on rollers. Sample copy 10 cents. Address the Publisher, C. L. VAN ALLEN, 171 Broad-
way, New York. ma25-1f

The American Medical Association.

The event of the week in our city has been the meeting in council of physicians from all parts of our country. The occasion is one of the highest importance and interest, and we are happy to see that the arrangements for the reception of our visitors have been so excellent, and the hospitable spirit evinced by associations and private individuals so general.

On Monday the State Medical Society met at noon. The President, Dr. T. M. Logan, of Sacramento, whom all our readers know by reputation, and by his meteorological contributions to the Press, delivered an interesting address. The same day, the representatives of the medical press of the country met in editorial convention in the morning. The President is Dr. H. R. Storer, editor of the *Journal of the Gynecological Society of Boston*. Dr. H. Gibbons, Jr., was elected Secretary *pro tem*. That evening Dr. Storer delivered an able address on the "Reciprocal Relations of the Medical Profession, its Press, and the Community." It appears that last year the Society had 13 journals on its roll, that one of these has been since discontinued, and that 26 have joined this year; so that they have now 38 out of the 41 regular medical journals now existing in this country. The following officers were elected at the meeting: President, Dr. E. F. Dawson, of New York; Vice-President, Dr. H. Gibbons, Jr., of San Francisco; Secretary, Dr. F. H. Davis, of Chicago.

The American Medical Association, the grand central society, organized in Philadelphia, in 1847, held its 22d annual meeting on Tuesday, about two hundred medical gentlemen being present. The officers of this important association are as follows: President, Dr. Alfred Stille, of Pennsylvania; Vice-Presidents—Dr. J. S. Wetherley, of Alabama; Dr. Henry Gibbons, of California; Dr. G. J. Heard, of Texas; Dr. Samuel Willey, of Minnesota. Permanent Secretary, W. B. Atkinson, M. D. Philadelphia; Assistant Secretary, Dr. Joseph Tucker, of California; Treasurer, Dr. Caspar Wister, of Pennsylvania; Librarian, Dr. F. A. Ashford, of District of Columbia. At the meeting, Dr. A. Stout, of this city, delivered the address of welcome, and President Stille, the annual address. Then Dr. S. W. Ruschenberger, U. S. N., read a report "On Protest of National Surgeons, etc.," and other reports were received and deferred. Dr. Stille's address, touching on many important subjects, deserves a careful and thoughtful perusal.

On Wednesday the Association met again. The names of two hundred gentlemen were reported as delegates and permanent members. There was considerable discussion with regard to the standing of members. Several essays were read and received. Dr. Logan, of Sacramento, Chairman of Committee on Prize Essays, reported in favor of E. R. Taylor, of Sacramento (first prize), and B. Howard, of New York, (second prize).

On Thursday, various reports were received. There was quite a discussion on a motion not to exclude delegates from female colleges from the Association. The question was finally indefinitely postponed.

The following were elected officers of the Association: President, Dr. D. W. Yandell, of Kentucky; First Vice-President, Thos. M. Logan, of California; Second Vice-President, C. L. Ives, of Alabama; Third Vice-President, R. M. Mitchell, of Alabama; Fourth Vice-President, J. K. Bartlett, of Wisconsin; Assistant Secretary, D. Murray Chester; Librarian, F. A. Ashford, Philadelphia. The next place of meeting is to be Philadelphia.

The convention visited, after the meeting, the Toland Medical College. There we must leave them, as we go to press on Thursday night.

THE SUTRO TUNNEL.—Congress, during its last session, passed a wise measure deprecating that a commission should be appointed to examine and report on the Suto Tunnel, and that this commission should consist of two officers of the U. S. Engineer Corps, and of a mining engineer. Probably we could find no more just and impartial persons than officers of the army for such a commission, who justly have a high reputation in such matters. We see that the President has appointed two excellent officers on this commission, Lieutenant-Colonels Horatio G. Wright and John G. Foster. Capt. W. P. King will act as Secretary.

Academy of Sciences.

The regular meeting was held on Monday, Dr. Blake presiding and Mr. Bloomer acting as Secretary *pro tem*. J. Eastland and O. Livermore were proposed as resident members. Dr. Blake stated that the Trustees had decided to re-incorporate under the old constitution with a few amendments to suit the altered circumstances. Action in this matter will be taken at the next meeting.

Dr. Cooper presented some 50 specimens of shells, which went far to fill some of the gaps in the collection of the Academy. Mr. Hanks presented a sample of the vermilion paint used by the Indians of Inyo county. This, on chemical examination, proved to be hydrated sesquioxide of iron and silica, reduced to a very fine powder. Mr. Hanks had noticed painted rocks in Kern county, and Dr. Blake had seen colored hieroglyphics near Salt Lake, which evidently were very old, as the Indians now are unable to explain them. The retention of the vividness of color in these is noticeable.

Dr. Kellogg had sent to Prof. Gray, of Cambridge, Mass., a specimen of the *Dicentra uniflora*, illustrated on p. 142 of the Proceedings of the Academy for the last year, just published. Prof. Gray had endorsed it as a new species, which endorsement was a matter of gratification to members of the Academy. Dr. Kellogg presented a specimen of *Polyporus variegatus*.

In connection with the matter of Indian paints, it was remarked that the *Erythritum hirsutum*, which Indians of the coast use for its coloring properties, is called by them "puceon," the same name used by the Indians at the East for the blood-root. Dr. Cooper remarked that in Oregon the *trillium* was incorrectly called blood-root, although of a different family. There is no blood-root (*sanguinaria*) on this coast.

Dr. Blake showed a chart illustrating by curves the variations of the barometer as influenced by the moon. That the moon had any such influence, has been denied, but the chart gives evidence of the fact. The observations were made at Iowa Hill in 1855-6, and the oscillations were mapped out for October to March, and will be completed hereafter. On the first days of the moon the lines are pretty straight; on the 4th to the 6th day, there is a slight oscillation; on the 7th to 10th, rather more; the principal disturbance is from the 13th to the 16th day; 17th to 21st, very little; 21st to 23d, more; 27th and 28th, rather increased, and then getting calm after the first days again. At a lower altitude the oscillations would be more marked. The reason why the barometric changes do not exactly coincide with the phases of the moon is probably owing to the centers of disturbances taking place at different months, their effect not being perceptible at other places until some hours, or even days, after it has already been pointed out; for instance, a storm at the Sandwich Islands does not affect the barometer until two or three days after the occurrence.

Adjourned to Monday, May 8th, in view of the presence in the city of the National Medical Association.

ATMOSPHERIC PHENOMENON.—To the person walking westward yesterday morning about 10 o'clock, says the *Alta* of April 29th, in that direction which commanded a view of the sky near the horizon, an extraordinary spectacle was visible. Right in the quarter where old ocean ought to be rolling its billows against the Cliff, rose up the Contra Costa range of mountains, with venerable Diablo in the distance. The calm, placid waters of the Bay laved the brown shores. The illusion was perfect, even to the yellow patches on the hill side. One astonished citizen was observed rubbing his eyes, vainly trying to discover the meaning of this awful dance of the hills, doubtful as to whether the phenomenon was not referable to the condition of his stomach. A view from a point from which the Contra Costa shore could be seen, revealed the fact that it was all haze in that direction. Not a line of the landscape could be discovered anywhere. It was not the fairy Morgana who has been playing of late such fantastic tricks in the lower country, which got up this wonder, for old Diablo was not standing on his head at all; nor were his grand proportions exaggerated or distorted. The picture was in every respect true to nature. No one could look on it without at first thinking that Contra Costa had started out, in a most inexplicable manner, on a voyage to China.

Working Old Claims.

We find an item in the Virginia City *Enterprise*, of April 25th, to the effect that parties have been testing the ore of some of the old claims, on Carson Hill, located and partially worked in 1860-61, and found that it can be treated with profit. The prices of treatment and the mining and milling knowledge then were such that the ore would not pay, while now it can be made to give fair returns.

This is one item of the many of the kind which will gradually appear, and a most hopeful one it is. This re-locating abandoned claims and re-working of old ore is what must be extensively practised and will produce larger amounts of money. That it is now possible, is a sign of large progress made.

There is a possibility, however, of trouble in this matter. We fear that as soon as a claim shall have been proved to pay, parties will step in with claims of prior possession, and the mines become involved in distressing litigation. We need some general laws on this matter which will determine definitely the rights of miners and define when a claim has been legally abandoned. Litigation and stock gambling have been the curse of the mining industry on our coast.

COLUMBIA COLLEGE.—We have received the catalogue of Columbia College, New York, for the year 1870-71, being the 116th since its foundation. From this we learn that the total number of students is 782, divided as follows: School of Letters and Science, 120; School of Mines, 92; School of Law, 243; School of Medicine, 327. One item which strikes us particularly is the attendance at the School of Mines. The system of instruction in this School embraces five parallel courses; Civil Engineering, Mining Engineering, Metallurgy, Geology and Natural History, and Analytical and Applied Chemistry. The course of instruction occupies three years. This is undoubtedly the best appointed mining school in the country.

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 215970 shows that our patron has paid his subscription up to the 21st of September, 1870; 4172, that he has paid to the 4th of January, 1872; 410, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Travelling Agents.

W. H. MURRAY—Eastern States.
M. B. SPARR—Pacific Coast.
THOS. FOYER—California.
WM. J. CLARK—California.
S. H. HERRING—California.
L. P. MCCARTY—California.
E. P. HICKS—California.
A. O. KNOX, City Soliciting and Collecting Agent.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper, or blank slip, without the name and residence of the subscriber is a thoughtless act, and needless both to subscribe and publisher.

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-bp-tf

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla's' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chocory Mills, Bruges, Belgium. 1825-ly

Scientific and Practical
BOOKS—ON—
MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by
DEWEY & CO.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price \$2.50 coin, or \$3 currency, postage free.

For single copies of the above works, or for the trade, address

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office
San Francisco.

7-30 GOLD LOAN

OF THE

Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 560.

A GOOD INVESTMENT. We are now selling, and unhesitatingly recommending, as a Profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 per cent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on

23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. The Bonds are issued by U. S. Tax, Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to the character of the first-class, prompt-paying Rail road security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment so accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 6 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES ON Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. Applications for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

For Sale by

JAY COOKE & CO.,

Philadelphia, New York and Washington,
Financial Agents Northern Pacific Railroad Co.
By Banks and Bankers generally throughout the country.
MAR25-13t-cw

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller-plate openings efficiently force the pulp directly under the millers.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 15v20-1mr,1amt

apl-10v20t

Travelers are always liable to sudden attacks of Dysentery and Cholera Morbus, and these occurring when absent from home, are very unpleasant. The PAIN KILLER may always be relied upon in such cases. As soon as you feel the symptoms, take one teaspoonful in a glass of new milk and molasses and a glass of hot water, stir well together and drink hot. Repeat the dose every hour until relieved. If the pains be severe, bathe the bowels and back with the medicine clear.

In cases of Asthma and Phthisis, take a teaspoonful in a glass of hot water sweetened well with molasses; also bathe the throat and stomach faithfully with the medicine, clear.

Dr. Sweet says it takes out the soreness in cases of bone-setting faster than anything he ever applied.

Fishermen, so often exposed to hurts by having their skin pierced with hooks, and fins of fish, can be relieved by bathing with the Pain Killer as soon as the accident occurs; in this way the anguish is soon abated; bathe as often as once in five minutes, say three or four times, and you will seldom have any trouble.

The bites and scratches of dogs and cats are soon cured by bathing with the Pain Killer clear. may6-1m

SALT LAKE CITY.—Chan, Reticker is agent in Salt Lake City and vicinity for the SCIENTIFIC PRESS and PACIFIC RURAL PRESS

Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CAYOTES, and other "Varmints."

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S SAFETY CAPSULES are made by the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

MANUFACTURERS:—1, WHARF ROAD, CITY ROAD,
LONDON, AND BORDEAUX, FRANCE.

Mining and Other Companies.

Owing to the time necessary to mail the present huge edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Hanscom Copper Mining Company.—Lo-

cation, Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1871, an assessment of five cents per share was levied upon the capital stock of said Company, payable on and after the 8th day of May, at the Secretary's office, 21 and 23 First Street, Office Golden State Iron Works, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 10th day of June, 1871, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of June, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,

JAMES BIDDOLPH, Secretary,
Office Golden State Iron Works No. 21 and 23 First St.,
San Francisco.

Mauntauuk Silver Mining Company—

White Pine District, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1871, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, at the office of the Secretary, at the Company's office, 37 New Merchants' Exchange (third floor), in San Francisco. Any stock upon which said assessment shall remain unpaid on the 1st day of June, 1871, will be advertised on that day at public auction, and unless payment shall be made before, will be sold on the 15th day of June, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary,
Room 37, New Merchants' Exchange, San Francisco.

Mina Rica Mining Company—Location of

works, Auburn Mining District, Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1871, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room 2, No. 418 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 30th day of May, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 20th day of June, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERRECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; its lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.

STEAM JET PUMP.
Blaklee & Williams' Patent—For
Water, Oils, Acids, Etc.

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.
We ask the attention of all
proprietors of steam
power to the following
points of merit—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of
an engine; it will not choke
up with foul water; it costs
much less to put up and
start; it will not wear out
in a lifetime, or requires
repairs; it is reliable, and
certain to work at all times;
it is not liable to injury
from freezing.
Satisfaction guaranteed or
the money refunded.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW
CUP." This is
a California
Invention,
and the
BEST and
Most Eco-
nomical
Lubricator
in use. It
keeps cool,
and its op-
erations are
very readily
observed.
Send for
Circular to
W. T. GAR-
RATT, Cor.
Mission &
Fremont
streets, San
Francisco.

DESCRIPTION:—D, is a glass chamber which contains
the lubricant. O is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F, is the discharge
pipe for the lubricant, provided with an inverted syphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E, a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the injection
of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and O. fcl8-tf

WHY THE WILSON
Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company gives a responsible guarantee
that the purchaser shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains,
from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and
repair enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its
merits. Ours can always be seen at the Pacific Iron
Works.
Ten of these Mills are now in operation.
For further particulars address

FURMAN R. WILSON,
San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivalled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merit.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.
